Besides other curious matter, Mr Jones gives us notices of the customs and incidents in connection with rings, and many anecdotes of remarkable rings, amongst the more remarkable of which were 'the wedding of the Adriatic' by the Doge dropping a ring into the bosom of the sea; the 'death-rings' of Borgia and the medieval Italian poisoners; the part rings have played in identifying the living and the dead, as when Cœur-de-Lion, returning from Palestine in disguise, was recognised at Gazara in Slavonia by his ring. The body of Sir Cloudeley Shovel, cast up after a storm on the rocks of Scilly in 1707, was identified by his emerald ring, and was removed to Westminster Abbey. Rings have saved life, have promoted diplomatic relations with semi-civilised nations, have been used as bribes; in short, have played an important part on many different occasions. The refusal of a bribe-ring was the first step on the ladder by which the herdsman's son climbed up to be Earl Godwin and the father of a king.

Rings have been lost and found in many strange ways: a matron of East Lulworth lost her ring one day; two years afterwards she found it inside a potato! A calf sucked off the ring of Mrs Mountjoy of Brechin: she kept the calf for three years, and when it became veal, or rather beef, the ring was found in its inside. Moore tells us, in his *Life of Byron*, of the interesting recovery of the ring his lordship's mother had lost many years before, and which the gardener brought in just as Byron got the letter containing Miss Millbanke's answer to his proposal of marriage. 'If it contains a consent, I will be married with this very ring,' exclaimed Byron, before reading the lady's acceptance of his offer. Solomon's ring, and the story

Herodotus gives us of the recovery of Polycrates' ring from the inside of a fish, are the first examples of a great array of like legends. Glasgow got the salmon and the ring in her city arms from a recovery of this kind, of which, however, there are several conflicting accounts. In former pages of this *Journal* we have noticed curious losses and subsequent recoveries of rings; and those who are further interested in the subject will find much entertaining matter in the volume before us.

MOTHER GOOSE.

TRIS, it seems, is no fanciful name got up to please children. There was a real Mrs Goose, or as she was familiarly called, Mother Goose, who signalised herself by her literature for the nursery. We learn this rather curious fact from an American newspaper, the *Congregationalist*, which, in describing a Christmas festival at the Old South Street Church, Boston, enters pretty largely into a biography of the lady. Her maiden name was Elizabeth Foster. She was born at Charlestown, where she resided until her marriage with Isaac Goose, when she became step-mother to ten children. As if that was not a sufficient family to look after, she by-and-by added six children of her own to the number, making sixteen 'goslings' in all. It was rather a heavy handful, and we do not wonder that she poured out her feelings in the celebrated lines—

There was an old woman who lived in a shoe,
She had so many children she didn't know what to do.

To entertain her young flock, Mrs Goose was in the habit of telling little stories in prose and verse, and singing songs, which were highly relished. Though tasked, she spent on the whole an agreeable existence. Her children having grown up, she was very much at her ease. Her daughter Elizabeth became the wife of Thomas Fleet, a printer in a small way in Boston. With this daughter, Mrs Goose, now a widow, went to live, and had the satisfaction of singing her old songs to an infant grandson. Now begins the literary history of Mother Goose. Fleet, the son-in-law, was a shrewd fellow, and, as a printer, he thought he might turn the penny by noting down granny's nursery songs, and selling them in a cheap and attractive form. They were issued in a book under the title, 'Songs for the Nursery; or Mother Goose's Melodies for Children. Printed by T. Fleet, at his Printing House, Pudding Lane, 1719. Price two coppers.' This title-page also bore a large cut of a veritable goose, with wide open mouth, shewing that the proverbial irreverence of sons-in-law is not a thing of recent origin. We are told that old Mother Goose did not resent the pictorial illustration, but took it just as sweetly as she had taken all the other trials of life. Possessing her soul in patience, and gladdening the hearts of grandchildren, she lived until 1757, dying at the advanced age of ninety-two. There, then, as we are assured, is the true history of Mother Goose. How the little books which she originated have spread over the world, need not be specified.

SUNNY DAYS ON THE THAMES.

WHEN city folk, weary of heat and dust, are beginning to think of distant flights—to Switzerland and its eternal snows; to the romantic legendary Rhine; perhaps even farther afield, across the great Atlantic to wondrous Niagara; or farther yet, to that new old world on the shores of the Pacific—I too tire of the closeness and turmoil of the town, and turn my steps towards the pleasant country. I am not going very far, scarcely more than a few miles, but I doubt if any of the travellers on their long journeys will see a lovelier spot.

It is late on an afternoon in early June as I drive along the shady green lanes from the quiet country station, and stop before the gate of a dear old red brick house, which I know and love well. The door stands hospitably open, and in the porch I see kind and friendly faces framed in a wealth of glorious roses and many-tinted creepers, which cling lovingly to the time-stained walls. Good old 'Belle' the black retriever comes to meet me, wagging her tail affectionately; and looking up in my face, seems to ask me what I have done with the curly black puppy I ruthlessly stole from her the last time I was here.

How pleasant the sunny garden looks! How sweet the flowers smell! How delightful does everything appear after the bricks and mortar I have left behind me; and yet here are bricks and mortar too, but ah! not town bricks and town mortar. Time touches the old house with tender hands, and mellows it year by year into richer tints.

A queer old house it is, with odd bits added on to it here and there, in defiance of all the laws of architecture, and startling you with unexpected corners and angles; with quaint tall chimneys springing from the moss-grown roof, out of which the smoke curls lazily in blue-gray clouds, and round which twine the Virginia creeper and purple clematis, trying curiously to peep in at the top of them; with ivy-framed windows flashing in the sun, and overhanging eaves, beneath which the sparrows chirp merrily. The rooms are low, but so comfortable; whether great Christmas logs crackle on

the hearth, throwing sparkles of light here and there, and leaving the distant corners all dim and shadowy; or whether, as now, the windows stand open to the summer air, and the rooms are invaded by the sweet country scents and the perfume of the mignonette borders outside.

But better than all else of beauty here do I love old Father Thames, and I run rapidly through the house on to the lawn on the other side. There the river wanders at the foot of it, lying across the verdant fields like a silver ribbon on green velvet.

'Let us go to our drawing-room,' says one of the girls who has followed me. 'We shall just have time to do that before dinner.' So we jump into the boat and scull into a neighbouring back-water, where we have christened by the name of 'our drawing-room' a little creek which runs into the bank, and is fringed with pollard willows, making a pleasant shade overhead. We chat cosily there for half an hour, the water licking the sides of the boat with a refreshing sound. A dear little brown water-rat comes and sits near us, and looks curiously at us out of his bright eyes; a kingfisher flashes by us like a sapphire; then the midges come and dance gaily round us, singing a song of which the 'refrain' is ever, 'It will be fine to-morrow!'

To-morrow has come, and the midges have foretold aright! The sun pours a brilliant flood of light into my room, calling me to come to the royal feast he has spread for me (poor weary citizen), of flowers and sweet perfumes and soft balmy breezes. I open the window with welcoming hands as he streams in, and stand there a moment listening to the birds chanting their joyous matins, to the rooks clamouring cheerfully in the tall elms, and to the busy sparrows who twitter noisily just above my casement. Roses have climbed the wall, and are peeping in at me, some still shyly folding their petals around them in virgin modesty, others already baring their glowing hearts to the kisses of the amorous air. The beds of scarlet geranium make brilliant spots of flame on the diamond-studded grass; and the river is no longer a silver ribbon, for it has caught

the sun's reflection, and flows like molten gold between the meadows. It is still early when I betake myself with a book to my favourite seat on the lawn. But I cannot read. The great book of Nature lies open before me, and dwarfs all other literature into insignificance.

After breakfast (even on such a morning as this we must breakfast), as is our wont, we load the boat with books, work, sketching materials, and lastly with ourselves. Two of us take the oars, and to their lazy cadence we glide down the sunlit river in the direction of one of our favourite haunts. The boys, as we still call them, stalwart young Britons though they are, have already disappeared with their fishing-tackle in their canoes; but we shall very likely meet by-and-by, as they know all our pet nooks and corners.

We take our way past the green banks, on which the wild-flowers make delicate jewelled mosaics; by tall beds of graceful wandlike reeds, beneath the shadows made by hanging woods bending to kiss their own reflections in the stream, until we come to a cool and shady retreat, hiding itself away modestly from the sun's bold and ardent eyes. Here we fasten the boat to a willow-stump and prepare to spend our morning happily in this sanctuary of Nature's own making. Some of us begin to sketch a gnarled old tree crowned with a diadem of feathery foliage; others take out their work; and one among us lays hands on a book, as an excuse for silent enjoyment.

Though what silence is there here? The merry insects hum and whirl around us, saying: 'Summer has come, summer has come;' the weary winds, faint with their long winter's strife, sigh softly in the tall tree-tops; a moor-hen calls shrilly from her nest among the rushes; a lark pours from the stainless heavens a rain of melody; and the silence overflows with music. The bright motes dance in the still air, trying to get into our shadowy abode.

Sol is in his kindest humour to-day; not harsh and fierce, as he will be later in the year, smiting with cruel hands the tender flowers, until they droop their sad heads beneath his hot anger; but wooing them with warm and genial smiles from their gentle mother's breast, beneath which they have been sleeping safely through the chill winter. All things beneath his beams rejoice. The river; the fields in their delicate green robes, which, as they grow bolder under his gaze, they will change for sweeping kirtles of ruddy gold; the silver clouds cradled in the sky's fair arms; even the modest river-buds which scarcely lift their shy eyes above the water. Around us float the pure cups of the water-lilies. The banks by which we sit are fringed with pale forget-me-not; and delicate ferns push their tender fronds through their beds of last year's fallen leaves—life springing from death. The pale pink water-grasses rear their heads above the ripples, and the sun stares them out of countenance, until by-and-by they blush a celestial rosy red; kingfishers gleam by, their blue wings flashing streaks of turquoise.

How sharp and clear the shadows lie in the embrace of the soft stream! Which is the real world, I wonder? Thine, one shining so joyously around and beyond us, or that other lying cool and still beneath our keel? How I should like to plunge down and see! But perhaps if I did, the water-pixies might throw their spells around me,

and I might never return to the world above, which after all is fair enough for me.

As I make this reflection, we see the bow of a canoe peeping into our watery bower; and I am brought back to earth by hearing a merry young voice inquiring if we have any lunch to spare. So we unpack our baskets, and landing, spread our sweet country fare on the sward—crisp home-made bread, pats of golden butter, fragrant honey, and fresh creamy milk. Then the talk, which has languished before, becomes brisk; and many a gay jest is bandied round the fallen moss-clad tree which forms our rustic table.

'Read us something,' says one of the merry group—'something suited to the scene.' So a book is taken up by willing hands, and a voice we all love reads us fair thoughts which have arisen in poet-minds while gazing on Nature's lovely works. High and noble thoughts they are, and to me they are dear familiar friends; but to-day, my eyes wander to the poetry in God's creations round me, and I whisper to myself:

Ye are living poems,
And all the rest are dead.

So the bright afternoon wears away, pleasant talk alternating with snatches of luxurious silence, and the evening draws on apace. The shadows begin to lengthen, and lie like swartly-clad giants along the grass. The birds hush their song, and here and there the curious fishes spring from their cool bed to take a last look at the dying day. Reluctantly we turn our faces homewards.

Right before us the sun is sinking with passionate glowing cheeks into the murky arms of Night. The gates of heaven open to let Phœbus pass through, and from out them streams a sea of wondrous light, in which pearl and opal clouds float in a lake of delicate green and amber. The trees look inky black against the sky's pure spiritual face. An owl hoots mournfully from yonder stately poplar; the silent bat flits by on noiseless wing; here and there a glow-worm is lighting its tiny lamp; and the frogs croak us a cheery 'Good-night!' as our boat glides softly by the rushes. But not yet do we return it. We say: 'We will come out again when the moon is up.'

And so we do. In defiance of any rheumatic or neuralgic future which our elders prophesy for us, evening after evening we come out to watch the fair Night lighting her beacon-fires overhead.

The mist-wreathed elms stand by the water like rows of ghostly sentinel monks with gray cowls drawn over their heads; the willows look like silver trees transplanted from some far Peruvian garden; and the water drops from the wet blades of the oars in little showers of diamond dew. Above our heads the nightingale is pouring his liquid melody over the land. We listen, still and hushed. Surely our hearts grow purified, and the cares and sorrows of the world drop from us unheeded as we listen.

Philomela's song makes the silence round us seem deeper and more calm. The flowers have folded their delicate robes more closely around them, and have lain down to dream beneath the stars; even the river seems asleep, and the dark shadows clasped so tightly to his breast. Slowly the pale moon climbs the purple vault of heaven, casts from her her gauzy veil, and looks down on us with her pure and vestal eyes. The stars

awaken one by one, and come forth to do her homage. The gold-hearted cups of the water-lilies drink long draughts of silver dew. The willows, like Narcissus of old, gaze wistfully at their own fair faces in the stream; and the aspens quiver with eerie thoughts unknown to us. Surely, riding on the moonbeam which rests on yonder ripple, I see a water-pixie; and resting beneath the shadow of the dock-leaves, I spy a wood-elf! But some one speaks, and they are gone. We drift silently homewards; silently, for our enjoyment has become too deep for words. Silently we land, and still silently I seek my chamber, and opening my window, gaze into the moonlit garden beyond.

The flowers have folded their leaves beneath the soft kisses of the night, and lie sleeping placidly in the dim and tender light; the air is laden with their fragrant breath, which is always sweetest when they lie dreaming beneath the summer stars. The flame-coloured geraniums, the white and wand-like lilies, and the many-tinted roses, are all alike, misty and indistinct; and the sinuous and mossy paths, touched here and there by the soft light, lose themselves in darkness beneath the dusky hedges. Beyond them lies my beloved river, on which the starry river-buds float tremulously. The earth is all at rest, and above it the moon hangs like a silver lamp in the star-lit sky; and overhead one nightingale, the last, for the rest have sunk into silence, trills forth his Elysian chant, and mingles with the dreams of the sleeping flowers.

What a fair world! Is it possible that sorrow exists, that these, God's ineffable works, can ever be defaced by sin?

Such are the days and nights I spend when I make holiday in the old house by the river. Alas! that ever the day should dawn when turning my back on its poetry, I return once more to the prose of our work-a-day world.

THE LAST OF THE HADDONS.

CHAPTER XXV.—IN THE LANE.

I HAD had a motive, which I fancied she did not perceive, in asking Lillian to accompany me on my errand to the Home that morning. It was Arthur Trafford's wedding-day. Mrs Tipper and I had done our best to keep the knowledge of it from her until it was over, and flattered ourselves that we had succeeded.

As we drew nearer home the sound of bells ringing merrily in the distance reached my ears; and in the hope of diverting her attention I talked on, apropos of anything or nothing. I fancied she was heeding, until she said gently: 'It is fortunate they have so fine a day, Mary.'

'I suppose it is,' I replied ungraciously. Then I presently added more pleasantly: 'But it is even more fortunate that you can say so.'

'Dear Mary, what did you expect me to say?'

I took the sweet face between my hands, and looked into the clear eyes, which did not flinch under my gaze, as she added in a low voice: 'I am not in love with another woman's husband, Mary.'

No; I came to the happy conclusion that she

was not. There was no cause for further anxiety upon that score. Had I only been right in my fancy about Robert Wentworth, how pleasantly might things now have arranged themselves!

Again I felt obliged to postpone telling Lillian about my coming happiness. It had seemed difficult to talk of my engagement the night before, how much more so now—on Arthur Trafford's wedding-day. I must still wait for a more fitting season, I told myself.

Mrs Tipper had done her best to make the little parlour appear as cheerful and home-like as possible; and I saw that she watched Lillian with loving anxiety. She had prepared quite a feast for our favourite meal that day. If hot cakes and everything else the dear little woman could think of in the way of dainties had been remedies for disappointed love, Lillian might have owed her recovery to them, so plentifully were they provided. She had the comfort of seeing her niece partake of the good things with an appetite which quite set her mind at rest.

If it really cost Lillian something so to gratify her aunt, I believe it was very little. She shewed too that her thoughts had not been absent during our morning's work, by joining very earnestly in my narration of what had taken place, and giving a very decided opinion about Mrs Gower. Before we bade each other good-night, Lillian had succeeded in satisfying Mrs Tipper, as she had satisfied me, that she was 'not in love with another woman's husband.'

As days passed on my news remained still untold. Something seemed always to be intervening to cause me to put off the telling it until the morrow. Looking back, I see how very slight were some of the causes which I allowed to prevent me from opening my heart to my companions; although at the time they appeared sufficient.

Meantime we were occupied from morning till night, Lillian and I working together as with one mind. But we presently began to miss our master, as Lillian laughingly termed him, and I grew more than anxious as the days he had accustomed us to expect him passed without our seeing him. Not once had we heard from or seen him since that never-to-be-forgotten night. Did he really blame me? Could he not forgive me? I tormented myself with all sorts of doubts and fears, in my heart of hearts dreading something even worse than his blame or anger. Robert Wentworth was not the man either to judge harshly or to be unforgiving.

It was nearly a fortnight since we had seen him, when one evening Becky mysteriously beckoned me out of the room. Lillian was playing one of our favourite sonatas, and I made my escape unobserved.

'Another letter, Becky?' I asked, putting out my hand for it with a smile.

'No, Miss; it's a woman this time,' returned Becky. 'She says that she wants to see you alone, and she won't come in. I was to tell you she's waiting down at the end of the lane, and to be sure to say you are to go by yourself.'

'What kind of woman is she, Becky?' I asked, my thoughts at once reverting to Nancy Dean.

'A more disagreeable one I never see,' very decidedly returned Becky. 'And as to behaviour, she seemed just ready to snap my nose off when I asked what name I should tell you. "No name at all," she said.'

'I will go, Becky.'

'Poor Nancy!' was my mental ejaculation; 'she has got into trouble again. It was perhaps too much to expect her to remain with people who believe her to be so much worse than she really is, just when she needs to be encouraged and strengthened.' I was stepping from the porch, when Becky earnestly pleaded for permission to accompany me.

'Do, please, let me come too, Miss Haddon, dear!' she whispered. 'I could stand a little way off, so as not to hear; and if she touches you'—

'She will not hurt me, Becky. Do not fear it. I know who she is.'

Becky stood aside, silenced if not convinced. I went out into the summer-scented air, and just pausing by the way to gather a rose for Nancy, passed on down the lane.

Not the slightest doubt as to whom I should see for a moment crossed my mind. My surprise was all the greater when I came in sight of a woman standing erect by the stile with her arms folded across her chest; who, a moment's glance told me, was not at all like Nancy—a tall thin woman, dressed in a long old-fashioned cloak, and what used to be termed a coal-scuttle bonnet.

Quite taken by surprise, I paused a moment to reconnoitre before advancing. She turned her face towards me, and although I did not immediately recognise who she was, I knew that I had seen her before.

'Do you wish to speak to me? I am Miss Haddon.'

'Yes; I know you are.'

Then it flashed upon me who she was.

'You are Mr Wentworth's housekeeper?'

'Yes.'

My heart sank with a foreboding of some evil, and for a moment I could not utter a word. Then screwing up my courage, I asked in as matter-of-course a tone as I could assume: 'He is quite well, I hope?'

'Nobody cares whether he's ill or well, I expect.'

'You are very much mistaken!' I replied, in some agitation. 'Every one who knows him would care a great deal! You ought to know that they would.'

I suppose my face and tone satisfied her that I was so far saying what I thought, though she only shifted her ground of offence in consequence.

'If he was ill he wouldn't be wanting people's pity.'

'But I hope— Is he ill?'

'Why should he be ill?' she rejoined angrily. Then endeavouring to command herself, she went on: 'But I haven't come here to talk about that. Ill or well, he doesn't know I've come here, and would be very angry if he did. You must please to recollect that. I should have been here before, but it took me two days, putting this and that together, to find out where you live. You are living with the ladies at the cottage down there?'

'Yes.'

'Well, that can't be much of a place; but I

suppose situations are not so plentiful, and anything is better than'—

'What is it you have come to say to me?' I asked shortly.

'You are very masterful, and know how to get your way when you want it. You two are a match for each other; and I knew you would find that out. I knew no good would come of it when I let you get the better of me that day; and I'd sooner do anything than come to you now. You may be sure of that.'

'I know that for some foolish reason you took a prejudice against me; but being disliked *before* one is known, ought not to distress one, though I should prefer not being disliked.'

'If you're not hurt you needn't complain,' she replied, as though determined not to yield an inch. 'What have you come to say to me?' I repeated.

'I suppose you did not come all this way to remind me that you are prejudiced against me?'

'No.' She looked over the hedge and around in all directions before continuing; then said in a low voice: 'You thought my master's looked but a poor place for a gentleman born to live in, that day. I saw how sharp you was to notice, and how poor and shabby you thought it all was.'

'You are too ready to ascribe thoughts to me,' I replied.

'But you did now; didn't you? You can't say that you didn't think things looked a bit poor?'

'Mr Wentworth can afford to be more careless about appearances than can most people,' I said, not in the least comprehending her drift. 'It was all well enough for a bachelor's home.'

'Ay, well enough for a bachelor's home perhaps; but not for a married couple, eh?'

'Really!'

'Try to keep your temper for another five minutes, if you please, Miss. I know there's no love lost between us two; but I've come here because I've got something to say; and proud and masterful as you are, I know you are the sort to be trusted, and I'm going to trust you. I carried Master Robert in my arms when he was a baby, and I know him and love him more than any fine madam ever can. He was left very poor, and he worked very hard, and a better master or kinder gentleman— But that's not what I've come to say; nobody will ever know his goodness as I do'—jealously. 'He was poor, and I was poor, and I've had some ado to keep things together for him. But about three years ago my brother died, and things changed for me. He was a small farmer down in Gloucestershire, and everybody called him a miser; but it is not for me to complain of his scraping and saving, for he left all he had to me, and a nice little nest-egg it turned out to be. It's been down in my will for Master Robert from the first day I had it; and it has been 'cumulating ever since; not a penny of it have I ever touched. The pleasure has been to think that there it was all ready for him, though I was too proud to see how much he liked working his way up in the world, to tell him about it before he wanted it.'

'I am sincerely glad to know he has so faithful a friend,' I said, holding out my hand to her.

'Wait a bit, Miss; let me say my say. To-morrow morning that money will be made over to Master Robert, and he will be told that he'll never see no more of me if he won't take it; and the

lawyer he says it brings in pretty nigh ninety pounds a year, now !' Pausing a moment to give me time to recover that.

What could I say ? Growing hot and confused and pained as her meaning began to dawn upon me, I murmured : 'It is a good sum—and'

'And that's not all,' she said eagerly. 'You must remember Master Robert is getting on now and being talked about. I've brought this paper down with me that you may see his name in it for yourself ;' taking a newspaper from her pocket, hastily unfolding it and pointing out with trembling finger a short but eulogistic notice of a pamphlet by R. Wentworth. 'There's no gain-saying that, you know.' Slipping it into her pocket again, she earnestly went on, laying her hand upon my arm, and seeing only him in her increased anxiety : 'I don't say that prudence isn't a good thing ; I'm not for foolish marriages when there's nothing to depend on ; but there's the ninety pounds a year, and what he earns, besides a house to live in, and my services for nothing ; and master says my bark's worse than my bite ; bless you, *his* wife's no call to be afraid of me !'

'Hush, pray hush !' I murmured, seeing all her meaning now. 'Do you think any one who loved Robert Wentworth would care about all that !'

'Then it is that he isn't loved ? God help him !' The cold, hard, set look came into her face again—though she would seem cold and hard now to me never again—and she folded her cloak about her.

'Will you tell me how Mr Wentworth is ?' I could not help asking.

'Oh, he's well enough ; nobody need think he's going to die of a broken heart. And you must please to remember that he knows nothing about my coming here, ma'am. And perhaps it isn't *too* much to ask you not to mention what a foolish old woman has been talking about ?'

'I should be as much grieved as you could possibly be for him to know anything about it, Hester,' I replied in all sincerity.

'Then I wish you good-night, Miss.'

'Will not you shake hands with me ?'

'I'm never much for shaking hands, Miss, thank you—stiffly, both hands folded in her cloak.

'Not for your master's sake ? Mr Wentworth is my friend, and I think he would be sorry'—

'He can't be sorry about what he doesn't know.'

'Well, you cannot prevent my respecting you, and that I shall do as long as I live.'

She went on down the lane, and I turned away, burying my face in my hands. Could I ever forgive myself !

Something—for a moment I thought it was a falling leaf—lightly touched my arm, and looking round I saw a large bony hand put from behind. I clasped it without a word ; without a word it was withdrawn, and I presently found myself alone. I turned and walked slowly and thoughtfully homewards. How completely though unconsciously she had shewn me her motive for seeking an interview with me ! She had divined that her master had had a disappointment, and must have drawn the conclusion that he had been refused solely from prudential motives. Consequently she had come for the purpose of giving me a better knowledge of his prospects than he himself could have done, and was ready for his sake to try to

overcome her prejudice against me. Nevertheless, my interview with old Hester tended to make me more rather than less anxious respecting her master.

SEA-EGGS.

THE visitor to the sea-side must frequently in his rambles along the beach have picked up specimens of the curious animals which are popularly known as 'Sea-eggs' and 'Sea-urchins.' The former name is applied to these creatures when they are found cast upon the shore and present the appearance of rounded or ball-shaped objects, each inclosed within a hard but brittle limy shell. Whilst the term 'urchin' is given to the same objects when they are seen in their more natural and perfect state, and when the outside of the shell literally bristles with spines. The name 'urchin,' in fact originally applied to the hedgehog, has been extended to denominate the sea-eggs, from their presenting the spiny appearance so familiarly seen in the common tenant of our woods and hedgerows. Thus the sea-egg is the sea-urchin with its spines detached and rubbed off by the unkindly force of the waves ; and the animal thus popularly designated is the *Echinus* of the zoologist, and belongs to the large class of animals of which the Star-fishes are well-known representatives.

The entire history of the sea-egg is of so curious a nature that the most casual reader may well feel interested in the account of the animal's present and past life ; whilst the feeling of mere curiosity to know something of one of the most 'common objects of the shore,' should prompt every sea-side visitor to make the closer acquaintance of the *Echinus*.

Suppose that we begin our examination by looking at the hard case or 'shell' in which the soft parts of the animal are inclosed. We find on referring to the development of the animal, that this 'shell' actually represents the hardened skin of the animal, and that viewed in this light, it closely corresponds to the shell of the lobster or crab. The shell is flattened at each pole, and we can readily perceive that it is composed of rows of little limy plates, which are disposed in a regular manner from pole to pole, or after the fashion of the meridian lines on a globe. Counting the series of plates, we find the shell to be composed of twenty rows ; but we may also perceive a difference between certain of the plates of which the rows are composed. Thus we find two adjoining rows of plates, which are perforated with holes. The next two rows are not so perforated ; whilst the third two rows possess holes like the first rows. We may, in fact, proceed round the shell, and come back to the point at which our examination began, with the result of finding that we may group the whole of the twenty rows of plates of this curious limy box into two sets—those with holes and those without ; and we may further discover that there are five double rows of perforated plates, and that these alternate with other five double rows which do not possess holes.

Each little plate of the sea-egg's shell may be most accurately described as being hexagonal or six-sided in form ; but this shape may be more or less modified in certain regions of the shell.

The five double rows of the shell which are perforated with holes, it may be remarked, are those through the apertures in which the small 'tube-feet' of the animal are protruded. And it may also be noted that in some of the sea-eggs these perforated rows do not extend from pole to pole of the shell, as in the common species, but are limited so as to form a rosette-like figure, on the upper surface or at the upper pole of the shell. This modification is well seen in a group of sea-eggs, not uncommon round our coasts, and which are popularly named 'Heart-urchins' from their peculiar shape.

The outside of the shell presents us with some curious features; the zoologist's study leading him thus to carefully note points which an ordinary observer would hardly deem worthy his attention. When we examine the outer surface of the shell, we find it to be thickly studded over with little rounded knobs or 'tubercles,' which are, if anything, most numerous on those parts or rows of plates which are not perforated. And if we carefully study one of the spines we shall find that it is hollowed out or is concave at its base. Clearly then, the spines are meant to articulate by means of these hollowed or cup-shaped bases with the rounded knobs on the outside of the shell, and in each case a true ball-and-socket joint is thus formed. The spines are thus intended to be moved, and they are not only firmly attached by a ligament or band of fibres to the surfaces of their tubercles, but appear to be moved by special muscles, which form a thin investing layer on the outer surface of the shell. The spines undoubtedly serve as organs of defence, but in some species they are employed as boring-organs to scoop out holes in the sand or shallow beds in rocks, in which their possessors lie snugly ensconced.

The outer surface of the shell also bears certain very peculiar appendages, known as 'Pedicellariæ.' These little organisms also occur on the outer surface of Star-fishes and other members of the sea-egg's class; but regarding their exact nature and functions, zoologists are still in doubt. The form of one of these pedicellariæ may be best imagined by figuring to one's self a small or minute stalk attached to the shell, and bearing at its free extremity two or three little jaws, which move actively upon one another, with a quick snapping motion. These little jaws can be seen to seize particles of food, and there is no doubt whatever that they possess a life and vitality independently of the sea-egg or other organism upon which they reside; since their movements are seen to continue after the death of the animal which affords them lodgment. Some naturalists have regarded them as 'peculiarly modified spines;' but the reasons or grounds for this belief are anything but clear, since it is difficult to imagine any reasonable explanation of the means whereby a spine could acquire an active living and independent nature. By good authorities, who have not ventured to theorise so boldly, the pedicellariæ have been regarded as *parasites* of some kind or other; and they may also possibly represent stages in the as yet unknown development of some organisms. Whilst, assuming them to be fully-grown beings, their function, as they exist on the shell of our sea-egg, has been supposed to be that of seizing particles of food, and of removing waste or effete matters.

The internal structure of the sea-egg shews its near relationship with the Star-fishes and Sea-cucumbers. The mouth is the large orifice opening at the lower pole of the shell; so that as our sea-egg crawls slowly and mouth downwards over the bed of the sea, or over the floor of its native pools, it can procure food without any very great trouble as regards its conveyance to the mouth. The internal furnishings of the body include a stomach and complete digestive system, along with a very peculiar set of jaws or teeth, lying just within the mouth, the points or tips of the jaws being usually protruded from the mouth-opening. This arrangement of teeth is named the 'Lantern of Aristotle,' and comprises five conical pieces, so arranged together and so provided with muscles, as to be perfectly adapted for bruising the sea-weeds and other forms of nutriment on which the sea-eggs subsist. Their near neighbours the Star-fishes do not possess any teeth; although curiously enough, the unarmed sea-stars prefer a richer dietary than that which contents their sea-egg neighbours, since they devour large quantities of oysters and other molluscs. Our sea-egg possesses a heart for circulating its blood, in the form of a simple tube; and although no distinct breathing-organs are developed, naturalists believe that the blood may be purified by being circulated through a delicate membrane which is named the 'mesentery,' and which serves to suspend and support the digestive organs to the wall of the shell. The fact that this membrane is richly provided with the delicate vibratile filaments known as 'cilia,' and that it is bathed in the sea-water—necessarily containing oxygen—and which is admitted within the shell, would seem to favour the idea that it constitutes the breathing-organ of these animals.

The sea-egg is not destitute of means for obtaining some degree of knowledge regarding its surroundings; and it obtains its *quantum* of information through the same channel by which man is brought into relation with the world in which he lives—namely the nervous system. The sea-urchin possesses no structure corresponding to a brain—indeed in all animals of its nature, the nervous system exists in a comparatively low and unspecialised condition. We do not find, in other words, that development and concentration of the parts of the nervous system seen in the highest groups of animals, and which enables these latter to form definite ideas regarding their surroundings and respecting the world at large. A cord of nervous matter surrounds the gullet of the sea-egg, and from this central portion five great nerves are given off; one nerve-trunk passing along the inner surface of each of the perforated double rows of plates of the shell, to terminate at the upper pole of the body. The only organs of sense developed in the sea-eggs appear to consist of five little 'eyes' of rudimentary nature, each consisting of a little spot of colouring matter and a lens. These eyes are situated on five special plates of the shell, developed at the upper pole or extremity of that structure. We thus remark that the parts of the nervous system, along with other portions of the sea-egg's structure, are developed in a kind of five-membered symmetry—if we may so express it. And it is a singular fact that not only throughout the sea-egg's class do we find the number five to represent the typical arrangement of parts and organs—as is well exemplified in the

five rays of the common star-fish—but we also discover that this number is one exceedingly common in the symmetry of flowers. This fact apparently struck an old writer—Sir Thomas Browne—as being a curious and noteworthy feature of the Star-fishes and their allies, since we find him inquiring ‘Why, among Sea-stars, Nature chiefly delighteth in five points?’—although to this suggestive query, the learned and eccentric author of the *Religio Medici* gives no exact or satisfactory reply.

The movements of our sea-egg are effected by means of an apparatus, which forms one of the most noteworthy parts of its structure. If a star-fish be dropped into a rock-pool, it may be seen to glide slowly but easily over the bottom of the miniature sea in which we have placed it. When we examine the lower surface of this animal's body, we at once perceive the means whereby its movements are performed; for existing in hundreds, in the deep groove which runs along the under surface of each ray, we see the little tube-feet or *ambulacra*, each consisting of a little muscular tube, terminated in a sucker-like tip. By means of an apparatus of essentially similar kind, the sea-egg is enabled to crawl slowly over the floor of the sea. The tube-feet existing to the number of many hundreds in the sea-egg, are protruded, as has already been remarked, through the holes existing in each of the five double rows of perforated plates of the shell. The mechanism of their protrusion depends on the presence of a special system of vessels, known as the ‘ambulacral’ vessels, which carry water to the little feet, for the purpose of their inflation and distension.

Thus on the upper surface of the shell we find a single large plate perforated with holes like the lid of a pepper-box. This plate opens into a long tube called the ‘sand-canal’—a name which is decidedly a misnomer, since the function of the plate resembling the pepper-box lid is to allow water to enter this tube, but at the same time to exclude particles of sand and like matters. The sand-canal terminates in a circular vessel, which, like the nerve-cord, surrounds the gullet; and from this central ring a great vessel, like a main water-pipe, runs up each of the five rows of perforated plates in company with the nerve-cord. At the base of each little tube-foot is a little muscular sac or bag, and into these sacs the water admitted by the sand-canal ultimately passes. When therefore the sea-egg wishes to distend its feet for the purpose of protruding them through the shell-pores, and of thus walking by applying their sucker-like tips to fixed objects, the water in the little sacs is forced into the feet, which are thus distended. Whilst conversely, when the feet are to be withdrawn, the water is forced back, by the contraction of the feet into the sacs, or may be allowed to escape from the perforated tips of the feet, so as to admit of a fresh supply being brought in from the interior.

The development of the sea-egg may be briefly glanced at by way of conclusion, along with a few points in its economic history. The animal, solid as it appears in its adult state, is developed from a small egg, which gives origin to a little body, usually named the ‘larva,’ but which, from its resemblance in form to a painter's easel, has received the name of *Pluteus*. This little body does not in

the least resemble the sea-egg; possesses a mouth and digestive system of its own, and swims freely through the sea. Sooner or later, however, a second body begins to be formed within and at the expense of this *Pluteus*-larva; whilst as development proceeds and ends, the sea-egg appears as the result of this secondary development, and the now useless remainder of the first-formed being is cast off and simply perishes. Thus the development of the sea-egg is by no means the least curious part of the animal's history, and presents a singular resemblance to the production of the Star-fishes and their neighbours.

The mere mention of the economic or rather gastronomic relations of the sea-eggs may appropriately form a concluding remark to our gossiping remarks concerning these animals. With our British prejudices in favour of eating only what our forefathers were accustomed to consider wholesome, it is not likely that the sea-eggs will appeal with success to be included as culinary dainties. Yet on the continent these animals are much esteemed as articles of dietary and even of luxury. The Corsicans and Algerians eat one species, whilst the Neapolitans relish another kind; and in classic times, when variety rather than quantity or quality was the chief feature of high-class entertainments, the *Echini* were esteemed morsels at the tables of the Greeks and Romans. Here then is an opportunity for another Soyer to tempt the modern cultivated appetite with a new and wholesome dish. Considering that crabs and lobsters are so highly esteemed, the sea-eggs but wait a suitable introduction to become, it may be, the favourite tit-bits of future generations.

A wise philosopher—the great Newton himself—remarked concerning the limitation of our knowledge, that we were but as children, picking up at most a few stray grains of sand on the sea-shore, whilst around us lies the great region of the unknown. Our present study may not inaptly be related to Newton's comparison, since it serves to shew that even the brief and imperfect history of a stray shell picked up on the sea-beach may teem with features so curious and with problems so deep, that the furthest science may be unequal to the explanation of the one or the elucidation of the other. Whilst the subject no less powerfully pleads for the wider extension of the knowledge of this world and its living tenants—knowledge which in every aspect reveals things which are not only wondrously grand, but also ‘fair to see.’

THE TWELFTH RIG.

IN SIX CHAPTERS.

CHAPTER V.—THE WORKING OF THE CHARM.

THE theatre was crowded with an assemblage of fashion and beauty, and many were the glances directed towards the boxes, and numerous the comments of those who came to see rather than to hear, on the beauties who shone there like so many stars striving to outsparkle each other.

In one of the side-boxes Eliza was seated with her husband. Passionately fond of music, she seemed to have forgotten her sorrows, till, on turning to Charles to make some observation, she perceived that some young men, acquaintances of his, had entered and were conversing with him. One of them was directing his attention to a

particular box. Following their eyes, she observed a young lady, all in fleecy white and pale blue, with pearls glimmering in her dark hair. A most radiant beauty, her eyes sparkling with extraordinary brilliancy, and seeming to far outshine the lustre of the diamonds that gleamed around; the rich damask of her cheek putting to shame the roses she held in her hand. Several gentlemen stood around her, attentive to every word and look, each striving to win her special regard. She appeared in buoyant spirits, and conversed with great animation, smiling often with singular sweetness. But her smiles, though so bewitching, were distributed carelessly, and she never distinguished any one of those about her above the rest.

Eliza, struck with admiration, gazed at her earnestly. The young lady looked in that direction. Their eyes met. A thrill passed through Eliza's frame. All at once the gay assemblage seemed to vanish from her sight, the lights burned dim and lurid, and the air grew heavy as if with death. The voices of the singers retreated far away. She heard the murmur of mountain rivulets, and the sighing of the wind over a wide space. Before her eyes uprose a lonely field, with the moonbeams shimmering over its dark ridges. She saw herself, and fronting her a shadowy white face and form, like the dim reflection in a stream, of a human figure. Then, mingling with the distant music, the words 'Doomed, doomed!' smote on her ears like a wailing cry of agony, or the scornful laugh of a mocking fiend.

With this scene before her, with these words ringing around her, she sat on, as if in a dream. Had she looked towards her husband, she would have seen a dark cloud on his forehead and a moody look in his eye. Could she have seen into his mind, it would have troubled her more.

'How lovely!' he thought. 'What grace, what ease and animation! And she might have been my wife. What a fool I was! Eliza is pretty enough still, but compared to her'—he turned, that he might make the comparison, but she was unconscious of it. 'Ah! mere country prettiness, which loses half its charm out of its place. Vivacity was her attraction, and that gone, what has she? She looks now as if she did not know what was going on around her. And for her I gave up the beauty that brings all Paris to its feet, lost a handsome fortune, alienated my family, and endangered my prospects from them. Yet that is not the worst. I see now that my marriage with Eliza was a mistake in every way. I was mad to throw away my prospects and happiness thus; to forsake her whom I really loved, and who loved me—then at least. Blind fool that I was!'

There was a stir in that box towards which so many glances were directed. The young lady had risen, and pale as death, leaning heavily on the arm of a middle-aged lady, prepared to leave the theatre. 'She is fainting; the heat is too much for her,' was whispered around. A dozen gentlemen sprang forward to wrap her in her mantle and call her carriage; she thanked them with a faint sweet smile, but uttered no word. When the carriage had driven away and all were out of sight, she cast herself sobbing on her companion's breast, and trembled from head to foot.

'Oh, do not bring me to these scenes any more!' she cried; 'I cannot bear it; indeed I cannot;

they are torture to me. I know you meant it kindly, dear friend—thought to rouse and cheer me; but it will not do; I cannot be gay like others while my heart is breaking. Oh, take me far away to some quiet spot, where I may pass the short time that remains to me in peace and seclusion!'

'Darling, we shall leave Paris to-morrow, if you really wish it,' returned the middle-aged lady; and her tone betrayed alarm, as if she feared for the result of so much emotion.

'Eliza!' said Charles, somewhat roughly; 'don't you see all is over and everybody is going away? Are you dreaming?'

She started and looked up with a bewildered air; then she saw how dark his brow was, and the cause puzzled her.

All that night Eliza lay awake tossing feverishly; she made an effort to dispel the thoughts that distracted her and compose herself to sleep; but when she closed her eyes, faces seemed to press close up to hers, familiar faces, that she used to see every day. It was useless to think of sleep, and she lay watching wearily till dawn.

In the morning, Eliza was so feverish and ill that she felt unable to rise. A doctor was sent for. Before he arrived, she had become delirious, and raved pitifully about her old home and her father. Another name too was often on her lips. The doctor, who was an Englishman, as he stood by her bedside, supposed it might be that of her husband. 'Will! Will!' she repeated over and over, sometimes in tender loving accents, then in tones of wild despair. When the physician took her hand she seemed to become conscious of who he was and of her own illness.

'I shall die,' she said in a sad quiet tone. 'I know I shall. There's no use in your coming to me. You may be the greatest doctor in Europe, but all your skill won't save me. I am doomed, doomed!'

He thought her still raving, in spite of her calm tone; but in reality she was not so now. Her youth and beauty, joined to her piteous look and tones, moved him. Some of her wanderings seemed to shew that she had once been accustomed to a sphere of life far beneath that in which he found her. He thought some sorrow or trouble weighed on her mind, and tried to discover if such were the case. But in answer to his kind questioning she only shook her head or moaned feebly.

On leaving his patient, the doctor sought Crofton. He found him lounging, with a very gloomy brow, over a late breakfast.

'I have seen Mrs Crofton,' he said. 'I do not apprehend any danger at present. It is a touch of fever, which will pass. But I wish to mention that change of air and scene are absolutely necessary for her. I was told by her maid that she has been in the habit of remaining very much within doors of late, and that she has been depressed in spirits.'

'She need not have remained within doors if she did not choose,' returned Charles coldly; 'and if she was depressed, it was totally without cause.'

The other looked at him. It was a strange tone for the husband of one so young and beautiful; and not long wedded, as he had been given to understand.

'Well,' he replied after a pause, 'I recommend that she should be removed to a quiet country

place as soon as possible—to-morrow, if she is able to bear the journey.'

'As you say so, of course it shall be done. My own arrangements do not permit of my leaving Paris at present, but that need make no difference; Mrs Crofton can go accompanied by her maid.'

Again the doctor looked at him, the tone was so indifferent, as if he wished to dispose of the matter at once, and be troubled no more. Merely mentioning the place he thought most suitable for his patient, a quiet little town in the south of France, he bowed coldly, and withdrew.

Charles rose and sauntered to the mantel-piece. 'She acts the fine lady well,' he muttered to himself. 'Ill and out of spirits! *She* has no cause to be so. As much as I lost she has gained. Yet she acts and speaks sometimes as if she had made a sacrifice for me. I could almost fancy that she regrets that clodhopping fellow. It is a pity, after all, she was so ready to jilt him. She can't expect that I will coop myself up in a wretched dreary place. We are not so very devoted now, either of us, that we require no other company than that of the other.'

In the evening Eliza was better; the feverishness had passed, and it was thought she would be able to leave next day; so Charles went to her room to inform her of the doctor's command, and the fact that the journey was to be made without him.

'I have arranged to remain here yet, and can't alter my plans,' he said. 'But my presence could do you no good; and when you are better you can join me; that is, if you wish to do so.'

If she wished to do so! He would not then care if she did not join him! His words and manner implied that she had become a burden to him, which he would willingly cast off, were it possible; since it was not possible, absent himself from her as much as he could. She turned, sighing, away; and Charles left the room without another word, without a kiss.

It had come now that he was actually estranged from her! He could let her go from him alone, ill as she was, and in a foreign land, the land he had brought her to! It was not with any wild passionate pang, such as she would have felt had she loved him, that she thought this: but a dead cold weight pressed on her heart, and a sense of utter desolation came over her.

'Alone, alone!' she murmured. 'Father, lover, friends, home—I abandoned them all, and for what?—for what?'

CHAPTER VI.—THE CHARM DISSOLVED.

Next day Eliza set out, accompanied only by her maid. No one, to see her, would have fancied she was not yet one year a wife.

In the sweet quiet spot to which she went her illness passed away; but she was weaker than before, and her health precarious. Her spirits too sank daily, and the rich glow of her cheek, dimmer during the last few months than it used to be, faded more and more. The sparkling smile of other days, or the discontented pout which had always betrayed any little 'temper,' never dwelt on her lips now. A softened subdued shade settled on her countenance. In her sadness and loneliness, forsaken by him to whom she would still have clung even when love was gone, she turned, in her

sorrow, to thoughts which had never occupied her before, to religion, the one source of consolation that remains to the disappointed and unfortunate; fortunate if they can embrace it, and find peace and full satisfaction somewhere at last.

In a peaceful nook, embosomed among a grove of beech-trees, there was a lonely little chapel. Thither Eliza went every evening, and kneeling among the few quiet worshippers, lifted her eyes to the sculptured form above the altar, whose mild angelic face and outstretched arms seemed to speak of pity and sympathy with human woe.

One evening she lingered till dusk began to gather in the quaint old place. It was now again the eve of All-Hallows, and her thoughts reverted to the past and all that had happened during one short year. Looking up at last, she found that the others had gone and she was alone. The pale spectral rays of a rising moon, broken and intercepted by the fluttering trees without, stole in at the windows and crept with a kind of stealthy motion across the floor. The silence was tomb-like. It smote on Eliza's heart. Part of the chapel, where the moonbeams did not pierce, was veiled in gloom, and in the darkness the draperies about the altar seemed to stir and take strange form. Indistinct masses, which looked as if they might at any moment become endowed with animation, filled the corners. Eliza could almost fancy that the dim dead who slept in the vaults beneath were rising round her. She turned to leave the place, and then perceived that she was *not* alone.

A female figure knelt at a little distance, the face buried in the hands. As Eliza moved down the aisle it rose slowly and turned round. With a low shuddering cry she sprang back, and almost sank to the ground. She gasped for breath. She tried to speak, but for some moments in vain. At last, in a loud cry, her voice broke forth: 'In the name of the blessed God and by this holy sign!' (crossing herself rapidly), 'speak! Who and what are you, that twice before have crossed my path? In the lonely field; in the crowded theatre, suddenly changing from an aspect of light and beauty to a ghastly corpse-like image; and now again!'

The figure approached a few steps, the lips moved, but no sound came. Eliza shrank back to the wall, pressing against it as if she would force herself through the stone. A low sigh sounded, a faint tremulous voice spoke: 'Twice before have you started up to bewilder and affright me: in the lonely field, when the night-wind was sighing; in the gay assemblage; and here again, the third time. Who and what are you, let me ask?'

Eliza rose. 'One who is lonely and unhappy,' she answered; 'who, having deserted others, is herself left alone now. If you would know my name, it is Eliza Crofton.'

There was a pause, then in low, awestruck tones, the last word was repeated: 'Crofton! And I am Ellen Courtney.'

'And we meet thus, for the first time knowing each other, though I have often heard your name, and you mine! Did you too, then, go to the Twelfth Rig last Hallow-eve night?'

'Listen, and I will tell you. He did not come home that evening—he, I mean, who is now your husband. There was company at the house, and he was expected. There was dancing and music, but I could not join in it. I stole away to my

own room, and afterwards wandered out into the fields. I had heard of the charm of the Twelfth Rig, but it was not with any settled intention of trying it that I went out. When I got to the field, overcome with sorrow and weariness, for I had walked a long distance, I sank down; and thinking that nothing stirred in that lonely spot but the night-wind, gave loose to the grief and despair that filled my heart. When at last I rose up, I saw a figure wrapped in a cloak standing motionless in the centre of one of the ridges, pale, with wild eyes, and black dishevelled hair. As I gazed, it uttered a dreadful scream, and turning, fled. I had heard stories of the banshee, and I thought this must be it, or some spirit of doom, that had appeared to warn me of my approaching death. I believe I sank down again on the ground. My senses seemed to leave me. I know not what I did, but I heard a voice crying "Doomed, doomed!" and I think it was myself that uttered the words.

'I heard it,' said Eliza. 'It pursued me as I fled, repeated, I suppose, by the mountain echoes. Ah! how it has haunted me. I tried to crush back the thought; but it was there still, though I wouldn't face it, and I felt in my heart that my days were numbered. Has the clearing up come too late? I have suffered so much, I scarcely feel fit for life now.'

'It comes too late for me. Though it was no spirit that stood in the midst of the Twelfth Rig, the charm will work still. I was ill after that night, very ill, else we might have met before you left, and recognised each other. Then came the shock that tore up by the roots the last hopes that lingered in my heart. You know to what I allude. I may speak of it now with calmness, standing as I do on the brink of the grave.—Why do you look so shocked? Have you never heard that Ellen Courtney was dying—dying of a broken heart?'

'No, no! I never heard it, never dreamt of it. O heaven!—wringing her hands, and raising them above her head, with a despairing gesture—'then I am a murderess! The punishment has descended in full force now. A curse could not but attend my marriage. Did not friends warn me again and again? and yet I persisted—persisted, though faith had to be broken on both sides, a heart cast aside, and trampled on. It was an unholy marriage, and the blessing of heaven could not sanctify it. It was that which made my husband cease to love me, shrivelled up my own heart, and made everything become valueless in my eyes. I was content to suffer myself; it was only reaping what I had sowed. But that you should suffer—suffer and die; you, who never injured any one, who must be gentle and good as an angel. But oh! she pursued, dropping on her knees, and raising her dark eyes pleadingly, as sinner might to saint, 'remove the curse before you die—if heaven so will—before I die, as perhaps I shall, and give me back my husband's love, the only thing that remains to me now.' The last words were uttered in a piteous moan.

'Do not speak so wildly,' entreated Ellen, sitting down on one of the seats, and raising her hand (Eliza marked its transparency) to her damp white forehead. 'You are not so much to blame. Life and happiness could never have been mine, even had you not intervened. If he ceased to love me, as he must have done soon, for he never loved me truly, I could not have borne it. My heart

would have broke, and I should have died all the same. You have my forgiveness fully and entirely—and he has too. Do not fret yourself for the lover you forsook. His wound is healed. He has found happiness with one who long loved him in secret. This was the appointed day for his marriage with your cousin, Mary Conlan.'

Eliza started, and the blood rushed to her face. He then had forgotten her; and the thought sent a bitter pang through her heart; yet she thanked heaven that it was so.

'Part of the weight is lifted from my soul,' she said. 'And I have your forgiveness too. Lay your hand on my head, and say again that you forgive me, and breathe a blessing on me.'

The shadowy white hand was raised. It lay like a spotless lily, emblem of heaven's pity and forgiveness, on the dark bowed head.

'I forgive you from my heart. If my earnest wishes can make you happy, be so.—Now I must go.' She rose, but tottered as she attempted to walk.

'You are weak,' exclaimed Eliza. 'Let me go with you.'

'No, no; there is no need. I have not far to go.'

'But still, let me walk with you, and lean on me. I shall think you cannot bear my presence near you, if you refuse.'

'Be it so then.'

They left the chapel together. Not a word was spoken as they walked slowly on till Ellen paused before the gate of a villa.

'Good-bye, Eliza. We shall never meet again on earth. This third meeting, in which each first knows the other, is the last. Even if I lived, we could not be friends, our paths should lie far asunder; though your words, and still more your looks, tell me how it is with you, that we are sisters in disappointment and misfortune. But there'—she lifted her eyes, calm and serene, to the sky, where the moon, now fully risen, gleamed fair and radiant—'there we may meet and be friends for ever. Farewell, Eliza.'

Overcome with emotion, Eliza cast herself, weeping, on the other's breast. For a few moments they mingled their tears together. 'Farewell, Eliza;' 'Farewell, Ellen.' A faint breeze swept through the beechen wood. It came wandering by them, and seemed to murmur in unknown tongue some sentence or benediction over their heads.

There was silence. Eliza felt her companion lean heavily on her. She grew alarmed. At last she said: 'It is not well for you to linger in the night-air. Will you not go into the house now?'

Ellen replied not. Heavier and heavier she leant, with a helpless weight that almost overpowered the other. Eliza raised the drooping head. A white, white face, a dim fast-glazing eye, met her gaze. It was the dead that lay on her bosom.

That night Eliza was very ill, so ill that a telegram was despatched in haste to her husband to come at once, if he wished to see her alive. He arrived next day, but only in time to gaze on a sweet marble face, that changed not even in the presence of the dread remorse that then awoke in his heart, and to clasp in his arms a fair but lifeless child, whose tender eyes had never opened on this world's light—whose only baptism was tears.

A few days after Hallow-eve, Daly received a black-sealed letter. It was that which Eliza had written to him, but never sent.

So they both slept. The remains of Ellen Courtney were conveyed to her own land; and on a dark November morning, when all nature seemed in mourning for the young and beautiful that had passed with the summer flowers, she was laid with her kindred, amidst streaming eyes and voices that blessed her name—

Poor victim of love and changeless faith.

But Eliza lay in a foreign soil, where the myrtle waved above her head, instead of her own mountain-ash—an exile even in death, from friends and home.

LIFE IN ST KILDA.

CONCLUDING PAPER.

On the 16th August I ascended the hill called Connaghar, where all the men had gone to catch and the women to carry home fulmars, leaving the village deserted. The weather was very warm, and although I carried my coat over my arm, I was fain to stop on my way up and cool myself in the light sea-breeze. About half-way up I saw my old friend Tormad, with his ruddy face and large white beard, seated on the edge of the cliff, with his attention fixed on the rope he held in his hands. 'Who is below?' I asked as I sat down beside him. 'Neil,' he answered. 'Is he far down?' 'Far—far,' he replied. Neil's voice could be heard calling from the abyss. In a little a crash sounds from below. Tormad looks anxious, and with craning head listens with deep attention; whilst two girls who had joined us, step with their bare feet to the very verge of the precipice and peer below. One of them, who has a light graceful figure, looks very picturesque as she stands poised on that stupendous cliff. She has a Turkey-red handkerchief on her head, and wears a coarse blue gown of a quaint shape, girdled at the waist, and only reaching to her knees. Her limbs are muscular and browned with the sun. She is engaged to Neil, and naturally feels anxious on his account. A shower of large stones had fallen, any one of which would have knocked his brains out had it chanced to hit; but fortunately a projecting crag above his head saves him. Tormad shifts his position to where he thinks the rock is less frangible. I leave him, and climb to where the cliffs form a lofty head or promontory which commands a view of the face of Connaghar. This hill rises one thousand two hundred and twenty feet above the sea, and is a precipice almost to the summit. The bottom of this tremendous cliff had been cleared of fulmars the previous day by men who had ascended from boats. Now the work had to be done from above.

It is a dreadful trade. A sound like the crack of a musket is occasionally heard, and one sees a huge stone bound and rattle with great leaps into the sea below. Parties of two or three men, laden with birds on their shoulders, are seen climbing by steep and perilous paths to

the summit. From the spot where I lie basking in the sun, a path leads downwards to a steep grassy *brae* bounded by a cliff. This is considered a safe road for women, and a number of them go by it to where the men can bring them fulmars. Some of the girls can carry about two hundred pounds' weight, and seem rather proud of their strength; but as they toil up the dangerous path to where I recline, I hear them breathing heavily and in apparent distress; but in a few minutes they are all right again.

In the intervals of work a number of them sit around me and offer me a share of their oat-cakes and cheese, and hand me the little tub covered with raw sheepskin in which they carry milk: 'Drink, drink! you have taken none!' A number of the men also come up the path with coils of ropes and bundles of inflated gannets' craws on their backs. They are all barefooted and stripped to their underclothing. A pile of fulmars has been collected beside us, and the men whilst they rest economise time by extracting the oil. The receptacle for holding the oil is the stomach of a solan-geese, which is held open by one man, while another takes a fulmar, and squeezing the body, forces the oil in a stream from its gaping bill. When the fulmars and oil are carried home they are equally divided. The birds are plucked, and the feathers are sold to the factor for six shillings a St Kilda stone of twenty-four pounds. The flesh is pickled and used as food in winter and spring. The oil is sold to the factor for one shilling a St Kilda pint, which is equal to about five English pints. Over nine hundred St Kilda pints were exported in 1875. I ought to mention that it is the young fulmars that are caught in autumn. No art is required to capture them, as they are unable to fly; but they offer all the resistance in their power by spitting their oil in the faces of the men. The oil has a disagreeable odour. The old fulmars are caught in summer when hatching; a noose tied to the end of a rod being slipped over their heads. About the end of August all the fulmars leave St Kilda and take the young to sea for their education. They are absent for about two months and a half, and return lean and worthless.

On the 1st of September I began to be slightly alarmed that I might be detained on the island until the succeeding summer. No vessel had called since my arrival on the 21st of June. My stock of provisions had become exhausted, and I had to give up tea and coffee, and subsequently bread. The people began to pluck up their little crops, neither sickle nor scythe being used. The oatmeal supplied by the factor being done, the islanders had to depend on the grain grown on the island. The oats are thrashed with a flail; are scorched in a pot or in a straw basket containing hot stones, previous to being ground. The grain is then ground with hand-mills by the women, who work like furies.

On the 7th the new boat went to Stack Lee for *gougan* or young solan-geese, and returned in the evening with a few—about forty to each man. As at the Bass and other fowling stations, so also here are the *gougan* killed by blows on the head with a stick. The flesh of the *gougan* is wild and fishy in flavour; but when baked is an article of food. Every morning when I went

up the village the usual salutation included expressions of fear that no ship would arrive. But my anxiety about the arrival of a ship was naturally less than theirs, for they were burning to receive further intelligence about the boat that was supposed to have been lost fourteen years ago. 'Is my poor wife alive? Is my mother, my brother, my son, my father, living or dead? Was my husband saved in some mysterious way, like Donald MacKinnon? Is he married again? Are all the women black in Africa?' Such were the agitating questions that passed through the minds of the people, and often found expression. Every time I went up the hill with my glass I would be questioned by some one on my return whether any vessel was visible, and my answer that there was not, was shouted from one end of the village to the other. The poor people were straitened for oatmeal, which was anxiously expected from the factor.

On the 5th of October in the evening, whilst I was sitting alone in a cloud of peat-smoke, gazing at nothing by the dull light of an iron lamp, my door was suddenly thrown open, and a woman in a state of alarm bawled out that there were strangers in the glen. I suggested that they were probably shipwrecked sailors, whom it would not be right to leave in the glen all night, cold, hungry, and without shelter. This seemed to move the women; and it was arranged that five men armed with staves should go to the top of the hill that separates the village from the glen and shout. In an hour or two the five men returned wet to the skin, and reported that, although they had whistled and shouted loudly, they had got no reply, and that they were sure there must be a mistake. But the woman still insisted that there were strangers in the glen. Next day a steamer was seen bearing away from the island, and it was no doubt her fog-whistle which had created the alarm.

In October, when the nights were getting long, spinning-wheels began to be busy in every house, making the thread which the men afterwards wove into cloth; and I spent the evening in one or other of the cottages, chatting with the people, and endeavouring to improve my Gaelic, and penetrate into their unsophisticated minds. I tried to tell them stories—such as *Blue Beard*—in which they seemed to feel a deep interest; the women sometimes improving my grammar, and helping me out of any difficulty. They would also tell me *sgéulachdan* or tales.

On the 21st October and for many days afterwards all the inhabitants went down the cliffs to pluck grass for their cattle. I saw the women lying on the narrow sloping ledges on the face of the rocks. A false step, and they would have fallen into the sea, hundreds of feet below, or been mangled on the projecting crags. About this time I gave up all hope of getting off the island until the following summer. My oatmeal was done, and after that I was obliged to depend on the people for a share of theirs. But I never wanted, although I put myself on short allowance.

On the 7th November a meeting was held in the church to return thanks for the harvest. A sudden change occurred in the weather: the sky became charged with thick vapour, and there was a heavy fall of hail accompanied by thunder and lightning. On the 8th December I went to the

top of the hills, and notwithstanding my light diet, felt remarkably well; but slipping when twenty yards from home, I sprained my ankle, and lay for some time in torture. I crawled into the house, and after a time succeeded in cooking my dinner. I slept none; and next day my room was filled with sympathising male friends and ministering angels. Some brought me presents of potatoes and salt mutton, turf and fulmar-oil. On the 10th I held a levee, the whole people coming to see me between fore and afternoon services. The men about this time began to weave the thread which the women had spun. Both sexes worked from dawn of day until an hour or two after midnight. Their industry astonished me. I soon began to limp about in the evening; and when the nights were dark I got a live peat stuck on the end of a stick, to let me see the road home. At this time I made a miniature ship and put a letter in the hold, in the hope that she might reach the mainland. I was anxious that my friends should know that I was alive. Shortly afterwards I made a lantern out of a piece of copper that had come off a ship's bottom. A large limpet-shell filled with fulmar-oil served for a lamp inside. This lantern, a clumsy affair, was more admired than my sketches. On the 12th of January, which is New-year's-day in St Kilda, service was held in the church; and to celebrate the occasion, the minister preached a sermon.

On the 17th the most remarkable event occurred that had happened in St Kilda for many years. The people had just gone to church when, happening to look out at my door, I was startled to observe a boat in the bay. I had been nearly seven months on the island, and had never seen any ship or strange boat near it all that time. Robinson Crusoe scarcely felt more surprised when he saw the foot-print on the sand, than I did on beholding this apparition. I ran to the shore, where there was a heavy sea rolling, and shouted to the people in the boat; but my voice was drowned by the roar of the waves. A woman who had followed me gave notice to the congregation, and all poured out of the church. The St Kildans ran round the rocks to a spot where there seemed to be less surf, and waved on the boat to follow. I went with the others. When we arrived at the place indicated, the islanders threw ropes from the low cliffs to the men in the boat; but the latter declined to be drawn up, the captain bawling 'Mooch better dere,' pointing to the shore before the village, and putting about the boat. All ran back; but before we got to the shore the strange boat had run through the surf. Instantly all the men in her leaped into the sea and swam to the land, where they were grasped by the St Kildans. In a few minutes their boat was knocked to pieces on the rocks.

The strangers were invited into the minister's house and dry clothes given them. They proved to be the captain and eight of the crew of the Austrian ship *Peti Dabrovacki*, eight hundred and eighty tons, which had left Glasgow for New York five days before. The vessel had encountered bad weather; her ballast had shifted, and she lay on her beam-ends about eight miles west of St Kilda. Seven men had remained in her, and no doubt perished. The ship was not to be seen next day. When the survivors had got their clothes

shifted, they were distributed amongst the sixteen families that compose the community, the minister keeping the captain, and every two families taking charge of one man, and providing him with a bed and board and clean clothes. I myself saw one man (Tormad Gillies) take a new jacket out of the box in which it had been carefully packed, and give it to the mate to wear during his stay, the young man having no coat but an oilskin. The oatmeal being done, the islanders took the grain they had kept for seed and ground it to feed the shipwrecked men. The hospitable conduct of the St Kildans was all the more commendable when one considers that their guests were all foreigners. But long before the five weeks had elapsed during which the Austrians lived on the island, they had by their good behaviour removed the prejudice that had prevailed against them at first. They were polite and obliging to the women, and went from house to house to assist in grinding the grain.

On the 28th January 1877 the wind blew violently from the north-west with heavy showers of sleet. It was the worst day I had seen in St Kilda. The huge waves came rolling into the bay against the wind, which caught them as they fell on the shore and carried them off in spin-drift. Yet many of the women went to church barefoot.

On the 29th the captain and sailors called on me and felt interested in seeing a canoe I had hewn out of a log. They helped me to rig her and to put the ballast right; but we had to wait until the wind was favourable. We put two bottles in her hold containing letters, which we hoped would find their way to the mainland and be posted.

This canoe carried a small sail, and was despatched on the 5th of February, the wind being in the north-west, and continuing so for some days. I thought she would reach Uist; but the Gulf Stream was stronger than I calculated on, and she went to Poolewe in Ross-shire, where she was found lying on a sandbank on the 27th by a Mr John Mackenzie, who posted the letters. Five days previous to the date when we launched the canoe, we sent off a life-buoy belonging to the lost ship. I suggested that a bottle containing a letter should be lashed to it and a small sail put up. This was done; but no one had much hope that this circular vessel would be of service. She was sent off on the 30th January, and strange to relate, drifted to Birsay in Orkney, and was forwarded to Lloyd's agent in Stromness on the 8th February, having performed the passage in nine days. During my residence in St Kilda, several canes that the Gulf Stream had brought from some tropical clime were picked up by the men. One was hollow and several inches in diameter. The St Kildans split these canes and make them into reeds for their looms.

On 17th February the Austrian skipper offered ten pounds for a passage to Harris in the new boat, for himself and men. The St Kildans accepted the offer, and arranged to send seven of their own men to bring her back. They would not allow the Austrians to go alone, being afraid that they (the St Kildans) might be left without a boat, and have no means of getting seed-corn and provisions. They drew lots who were to go, and it was stipulated that I was to be one of them. All was settled except the weather. We were waiting for a promising day, when, on the 22d, about seven in the

morning, as I was lying in bed and thinking of getting up to make my breakfast, I was startled by hearing the sound of a steam-whistle. I lay back again muttering: 'It was the wind;' when hark! the whistle is repeated. I leaped up, ran to the door, and saw, sure enough, a steamer in the bay! Huddling on my clothes, I rushed barefoot up the village, rattling at every door, and shouting 'Steamer—strangers!' In a few minutes all the people were astir and hurrying to the shore. I had just time to throw the articles that lay handy into my trunk and to get on board the steamer's boat, which I saw belonged to Her Majesty. Then I discovered that I had left my purse and other property in the house; but the surf was too great to allow me to land again. I got on board the steamer, which I found to be the *Jackal*. 'How did you know we were here?' I inquired of one of the officers who stood on the quarter-deck. 'From the letter you wrote and put into the bottle lashed to the life-buoy.' I ran to the side of the ship muttering to myself: 'There is a Providence that shapes our ends, rough-hew them as we will;' and bawled to the St Kildans in the boat alongside: 'It was the life-buoy brought this steamer here, you incredulous people;' for they had smiled, although good-humouredly, at my efforts to send a letter home. A small supply of biscuits and oatmeal was given to them; and waving an adieu to my good St Kildan friends, we were speedily receding from the island.

I found all the officers extremely friendly and agreeable, and here beg to return my hearty thanks. I was made to feel quite at home. The shipwrecked captain and I were accommodated in the cabin. The Austrian sailors were well taken care of forward, and seemed particularly delighted at again having as much tobacco as they could use. We had been all smoking dried moss.

The wind had risen and the sea become rough; and if the *Jackal* had been half an hour later, she would have been obliged to return with her errand unexecuted; for it would have been impossible for a boat to approach the shore. We reached Harris the same evening, and anchored in the Sound all night. But as this part of the journey has appeared in the newspapers, I need not repeat it. Suffice it that I arrived barefoot and penniless, but in good health and spirits, in Greenock on the 26th. Here my narrative ends.

[Many of the facts related in the foregoing narrative were published in various newspapers in the early part of the present year, and led to considerable discussion. Stormy seasons, as we have seen, may set in, and communication with the proprietor or his factor be rendered impossible; the most anxious efforts to transmit provisions may be rendered abortive, and famine, if not actual starvation, be the result. Various hints for the melioration of the poor St Kildans have been thrown out, amongst others that those isolated beings should quit the island for good, and seek a new home in the more civilised Hebrides or elsewhere. One thing is sufficiently obvious, if the people are to remain on the island, they should be taught to speak and write English. Their adherence to Gaelic condemns them to innumerable privations, above all it excludes them from communication with the outer world, on whose sympathy they are forced to rely. Half a century ago, Dr John Macculloch lamented this exclusive use

of Gaelic; and we echo all he said on the subject. We have no objection to Gaelic being made a philological study, but its continuance as a spoken language is in all respects to be regretted.—Ed.]

THE MONTH:

SCIENCE AND ARTS.

THE 'season' is at its busiest: crowds of sight-seers are looking at the pictures in the Royal Academy, the Grosvenor Gallery, and in other resorts, and painting and sculpture are everywhere talked about; while fine art rejoices in its annual holiday, and 'art sales' (which are too often artful) draw throngs of competing buyers. The debates in parliament on reform of our universities have revived the education question; and sanguine talkers who believe that education can do everything, have had to be reminded once more that endowments however ample cannot create genius; that our greatest achievements in science, art, or literature have been wrought by unendowed men, and that nature will not produce a larger proportion of highest quality brain even though schools be multiplied. Meanwhile the experiment for the promotion of scientific research initiated by government has advanced a stage, and the investigators recommended by the Council of the Royal Society have received grants of money from the Paymaster-general to enable them to carry on their work. As this experiment is to be continued for five years, we may reasonably expect that it will assist in resolving the endowment question.

The cost of the expeditions sent out by this country in 1875 to observe the transit of Venus has been ascertained: it is forty thousand pounds; the estimate was twenty thousand pounds. As will be remembered, other nations engaged in the work as well as ourselves; and we have it on the authority of the Astronomer-royal that the total expenditure 'may amount to two hundred thousand pounds.' This is a large sum to pay for the endeavour to solve the problem of the earth's distance from the sun; but the problem is one of essential importance in astronomical science, and there is reason to hope that when all the computations are completed the true answer will appear. Remembering as we do the eclipse expeditions assisted by the Treasury and the Admiralty, and the expensive and abortive Arctic expedition, we agree with the learned functionary above referred to that 'the government has been very liberal.'

By a method known to astronomers, observations of the planet Mars can be made available for determining our distance from the sun. Sir George Airy speaks of this method as 'the best of all;' and as Mars is this year in the most favourable position for these special observations, a private expedition is to be sent to St Helena or to Ascension to make them. The expense will be about five hundred pounds; and this is to be provided

by gifts from scientific men, and by a contribution from the Royal Astronomical Society.

The formation of meteorites is a question which has long been discussed by mineralogists and physicists. Professor Tschermak, after much study, has come to the conclusion that the active agent in the process is volcanic. He points out that the meteorites which fall to the earth are angular in form, that they have no concentric structure even in their interior, that their external crust is not an original characteristic, and that they are evidently fragmentary. Examination of the crust has shewn that during the later stages of flight, disruption of the meteorite itself sometimes takes place; and it is a fact worth record, that guided by the appearance of the crust and peculiarity of shape, Professor Maskelyne once succeeded in reconstructing a meteorite from fragments which had fallen miles apart.

From much evidence of this character Professor Tschermak has been confirmed in his views. He argues that 'the finding of hydrogen in meteoric iron is a proof that permanent gases and perhaps vapours, which are the great agents in transmitting volcanic energy, have played some part in the formation of meteorites; and although it may ever be impossible to obtain direct evidence of the volcanic activity which is supposed to have hurled these mysterious masses of stone and metal into space, yet such evidence as the violent gaseous upheavals on the solar surface; the action of our terrestrial volcanoes; and the stupendous eruptive phenomena of which the lunar craters tell the history, lend powerful support to any theory which assumes that meteorites owe their formation to volcanic agency.'

Professor Boyd Dawkins in giving an account to the Manchester Geological Society of his visit to the crater of Vesuvius said: 'A coating of yellow sulphur about three inches thick covered the lip, and beneath this the loose gray ashes gave out aqueous vapour at every pore, which deposited on them in some places white powdery sulphate of lime, in others common salt, sal ammoniac, green chloride of copper, and specular iron ore, which looked like little pieces of shattered mirrors scattered through their substance. It was obvious that here we had a striking proof of the mode in which water, in passing through heated rock, can carry minerals in solution and ultimately deposit them. In these deposits we could easily recognise the mode in which the various metals were brought up from deep down in the earth's crust, and deposited in holes and crannies in the rocks which are accessible to man as mineral veins.' In this description we seem to have an approach towards an answer to the oft-repeated question—Where do metals come from?

Further particulars, which will be regarded as surprising, have been published concerning the Pennsylvania oil-wells. The Delameter well, sixteen hundred feet deep, sends forth gas at such a vehement pressure that a plummet-line weighing sixteen hundred pounds can be pulled out of the bore-hole by hand. The ascending speed of the gas is seventeen hundred feet per second; the quantity amounts to one million cubic feet per hour, or more than fourteen hundred tons a day; and the heating power is twenty-five per cent. greater than that of good bituminous coal. After this explanation it is easy to understand

that the well, situated in a valley surrounded by mountains, furnishes heat and light to the whole neighbourhood. From one of its pipes, three inches in diameter, a flame rushes, 'the noise of which shakes the hills, and is heard at a distance of fifteen miles. For a distance of fifty feet around the earth is burnt; but farther off, the vegetation is tropical, and enjoys a perpetual summer.'

It is known to chemists that turpentine when oxidised in a current of air in presence of water, yields peroxide of hydrogen, camphoric acid, acetic acid, camphor, and certain other less defined substances. The progress of the oxidation is an interesting study, and the solution produced is found to have great power as an antiseptic and disinfectant. White of egg, milk, and beer treated therewith are kept fresh for some time. 'From a series of experiments undertaken with the view of ascertaining to which constituents of the solution the antiseptic and disinfecting property is to be ascribed, the power was found to be distributed between the peroxide of hydrogen and camphoric acid; but the former of these is able to evolve large quantities of oxygen, which in this state is nascent, and of a powerful oxidising nature.'

A curious case of glass-making is published in the Proceedings of the Newcastle-on-Tyne Chemical Society. A large mass of esparto grass was burnt by accident. Lumps which might be called grass clinkers were found among the ashes; and these on being properly treated in a kiln produced glass which is described as 'a very good sample of bottle-glass.' From this it is easy to understand that in past ages some great bonfire of vegetable matter may have led to the discovery of glass. Farmers who are unfortunate enough to have their stack-yards burned, might possibly find straw clinkers among the débris. This would be worth noting, for silica enters largely into the composition of all grasses and cereals.

In South Russia, Hungary, parts of Italy, in Egypt, India, and other parts of the world where no coal is to be had, different kinds of vegetable refuse are used as fuel for steam-engines. In a paper read at a meeting of the Institution of Civil Engineers a table is given of the heating value of the refuse as compared with coal. It has been found in Russia that a little more than four acres can be cultivated with the waste straw of one acre, which when compared with the results of steam-plough trials at Wolverhampton shews that one pound of coal is equivalent to four and one-sixth pounds of straw. An engine to burn vegetable waste requires a greater heating surface than an ordinary engine; and those of the most improved construction are self-feeding. In Egypt the stalks of the cotton-plant and megass, or waste sugarcane, are the principal fuel; and the equivalent quantity of these to one pound of coal is less than of straw. But there are engines in England which burn vegetable waste; and the author of the paper above mentioned is of opinion that 'as the demand for mechanical appliances increases, so will the difficulties increase of obtaining the best qualities of fuel for steam-boilers in rural districts.' And he suggests that the only method of rendering the use of steam-power universal, particularly for agriculture, would be to construct the boiler of the engine so as to utilise the local supplies of combustible material of every kind.'

Among scientific novelties worthy of notice are

the *Harmonograph*, an instrument constructed by Messrs Tisley and Spiller. It combines a series of pendulums, susceptible of motion in every direction, one of which carrying a pen, traces curves of remarkable forms on a sheet of paper. Some of these curves represent waves of sound as given off by a musical instrument, and certain waves of light. Thus the invisible is, so to speak, made visible, with manifest advantage to natural philosophy.—Next, the *Otheoscope*, a modification of the radiometer designed by Mr Crookes. In this little instrument the vanes do not rotate, but are fixed near a horizontal disc free to move. The influence acting on the vanes is thrown from them upon the disc, and the disc spins round with great rapidity. The useful applications of this novelty have yet to be discovered.—And Mr N. J. Holmes has invented a flaring projectile or shell which when fired from a ship at sea falls into the water at a distance of two miles if required; floats for an hour, and throws out a powerful light, which in dark nights would be useful in detecting the position and watching the movements of a hostile fleet.

The Registrar-general pursuing the even tenor of his way amid the world's excitements, has just published his Report on the public health of 1876. He tells us that the area of London (taking the registration division) is one hundred and twenty-two square miles, with fifteen hundred miles of streets, about two thousand miles of sewers, and 417,767 inhabited houses. The population numbered nearly three millions and a half; but taking in the outlying districts, 'greater London' as the Registrar calls it, contains 4,286,607 inhabitants, among whom the births were 153,192, and the deaths 91,171. Some of these inhabitants live in the Plumstead Marshes, eleven feet below, while the dwellers at Hampstead are 429 feet above high-water mark. These differences of level imply different conditions of health; but the death-rate was not more than 21·3 per thousand; which contrasts favourably with the death-rate in other towns and cities within the kingdom and in other parts of the world.

Economy is an important element in the maintenance of health, and Dr Farr points out what looks like a waste of resources. He says: 'The capital engaged in the gas and water companies of London is £22,492,157, which realised in the year ending April 1876, a profit of not less than £1,676,542, or seven and a half per cent. all round. Now, if this amount of capital were required to construct all the works necessary to supply London with the best gas and pure soft water at high-pressure, it could probably be raised at four, or certainly three and a half per cent. less than is now paid in dividends. If the capital were raised at four per cent. £776,856 would be set free; out of which, after the companies were adequately compensated, there would be a large revenue for education and many municipal purposes.' The facts set forth in this paragraph should be taken into serious consideration by all concerned.

A paper on the Climate of Scarborough in the *Quarterly Journal* of the Meteorological Society is worth attention, as it sets forth the atmospheric movements to which that fashionable watering-place owes the amenity of its summer climate. The highest summer temperature, we are informed, is seventy degrees; and the temperature of the sea

is commonly five degrees below the temperature of the air. 'Another noticeable fact is, that in hot weather, with a tolerably clear sky and a temperature between eight and nine A.M. of about sixty degrees, rising to a maximum during the day of nearly seventy, the wind, which in the morning is blowing from south-west or west-south-west, generally backs to the south-south-east by the middle of the day, bringing in a cool refreshing breeze from the sea. This backward movement of the wind is easily accounted for, when it is remembered that with such a high temperature and an almost cloudless sky, the ground becomes much heated, causing the lower stratum of warm and rarefied air to ascend, while the cooler and heavier air is then drawn in from the sea to supply its place;' and the moisture in this sea-breeze by tempering the sunshine renders outdoor life the more agreeable.'

As Fiji is now one of our colonial possessions, enterprising emigrants will perhaps resort thither. They may find information concerning the productions and weather of the group of islands in a paper by Mr R. L. Holmes, published in the last number of the *Quarterly Journal* of the Meteorological Society. The first quarter of the year comprehends the 'hurricane months;' from January 1 to March 28, 1875, ninety inches of rain fell; an inch a day. The driest month is July; the south-east trade-winds are then strong; so strong indeed as to blow away the cotton, which then 'breaks out with a rush,' unless it be quickly gathered. The climate generally is described as healthy; fevers, liver-complaints, and cholera, diseases almost always fatal in a tropical country, being almost unknown. But a painful disease of the eyes is common; and small wounds, even mosquito bites, have a tendency to become serious sores, very difficult to heal. The natives are a decidedly healthy race, notwithstanding that they prefer to build their villages on swampy ground. That no harmful consequences ensue may be due to the position of the islands in the region of the trade-winds, whereby breezes always prevail. Emigrants from Europe soon lose much of their fresh ruddy appearance, their blood gets thin, and they probably lose in weight; but if they will abstain from indulgence in ardent spirits they may become acclimatised with but little risk of health.

SICILIAN BRIGANDAGE.

A WRITER on this subject in the *Edinburgh Review* for April more than confirms all that we stated on Italian Brigandage in an article last January. We have in particular from this writer a clear account of that system of organised iniquity known as the *Mafia*, with its kindred associations the *Camorras*. The *Mafia*, in fact, has an endless ramification of spontaneous and illegal societies, and it comes pretty much to this, that society in Sicily, high and low, official and non-official, is one great confederacy to rob and murder at will, and otherwise defy or circumvent the law in any way that seems best. The curious thing is how any show of orderly civilised usages can be maintained. Externally, in Palermo and other places, there is an aspect of peacefulness and honesty; but beneath the surface nearly all proceedings are regulated by force and deceit. The very attempt to seek pro-

tection from the law brings down vengeance so remorseless that well-disposed persons are fain to be silent under extortion. There are three hundred and sixty communes in Sicily, and every one of them, says this writer, 'has its own *Mafia*, of which the character varies according to local tendencies and interests. In one place its energies are devoted to the conduct of the elections and the manipulations of the ballot-box; in another, to directing, by means of a *Camorra*, the sale of church and crown lands; in a third, to the apportionment of contracts for public works. . . . By a singular anomaly, the middle class—that very class of which the absence is deplored in the rest of Sicily as the absence of an element of order—forms in Palermo the chief strength of the *Mafia*. Its proverbial virtues of prudence, industry, and foresight are here exercised in the calling of crime. The so-called *Capi-mafia* are men of substance and education. To them is due the consummate ability with which the affairs of their association are managed—the unity of direction, precision of purpose, and fatality of stroke. They determine with unerring tact all the nice points of their profession; in what cases life may be taken, and in what others the end in view can be attained by mere destruction of property; when an important capture is to be effected; when a threatening letter sent, or a shot of persuasion fired; when it is advisable to suspend operations, and when to inspire terror by increased ferocity. By them, relations are maintained with government offices in Rome, whose intrigues are generally successful in obtaining the dismissal or removal of obnoxious officials; so that complicity with crime is an almost necessary condition of permanence in any responsible position.'

For this state of affairs, which violates all our conceptions of a civilised community, the reviewer offers no practical scheme for redress. Reform, in the ordinary acceptance of the word, seems impracticable. Society is leagued to maintain a universal terrorism. Judges, magistrates, police-officers are incorporated in the gang of evil-doers. The military sent to preserve order are inefficient. Whether from fear or favour, brigandage is triumphant. Evidently the Italian government is powerless to cure the disorderly condition of Sicily. The very members of the government labour under suspicion of complicity. More probably, they are afraid to give offence by acting with persistent vigour. Constitutionalism carried to excess in a region wholly unprepared for it, even in a moderate degree, might be described as the bane of the country. It is in vain to appoint new native magistrates and new police, for all are bad together. The feeble military force sent to support the law is out-manœuvred or laughed at. Without denying that things may mend in the course of ages, we should say, that what Italy wants is a Cromwell with his Ironsides to stamp out by military execution the ingrained villainy which now afflicts one of the finest and most productive islands in the world. As there is, however, no chance of a soldier of the Cromwell type casting up, Sicily, we presume, must continue to be a disgrace to Italy and as great a scandal to Europe as Turkey.

WINDOW WILLIE

A TWEEDSIDE TRADITION. BY W. CHAMBERS, LL.D.

CROSSING the tall and narrow old bridge of several arches which spans the Tweed at Peebles, is seen an aged gentleman riding composedly on a small white pony. His head is bent droopingly down, as if meditating on some important mission. From his general aspect, he may be a gentleman-farmer, disposed to take things easily at his time of life; or he may be some retired public official who keeps a pony, and in good weather pops about for amusement. His dress has nothing particular about it. He wears a blue coat with metal buttons and capacious outside pockets. His legs are encased in buff breeches, white rig-and-fur woollen stockings, and black spats, a kind of short gaiters, over the ankles. Any one may observe that he is no common person. At the end of his watch-chain dangle a gold seal, a Queen Anne sixpence, a small and very pretty shell, and a flexible watch-key. Instead of using a riding-whip, he has in his right hand a perfectly respectable gold-headed cane, with which he occasionally gives a gentle pat on the side of the pony. Altogether a creditable affair, as things went towards the end of last century.

This imposing personage, according to tradition, was proceeding in a southerly direction across the bridge from his residence at Cabbage Hall, on Tweed Green, in order to pursue his way down the right bank of the river to the mansion of Traquair. It is a pleasant ride of seven to eight miles; and looking to the leisurely progress of the little nag, it is not unlikely he may reach his destination in an hour and a half. So far well. But who is this venerable gentleman? His proper designation is of no consequence. Locally, and somewhat irreverently, he is known as Window Willie, a man of genial temperament, but who professionally commands a degree of respect in the neighbourhood; for he is the district inspector in relation to the tax on window-

lights, and it is not surprising that with all his good humour people are a little afraid of him.

Is Window Willie going to inspect windows in that old weather-beaten chateau of the Earl of Traquair? Not at all. He is a chum of the old Earl, and what his particular business happens to be on the present occasion will afterwards appear. In the meantime, as paving the way for Window Willie's interview, we may run over a few particulars concerning the Traquair family. There need be the less ceremony in speaking of them, as all have gone to their rest. The family is extinct, leaving not a shred behind.

The Stewarts of Traquair come first prominently into notice in the reign of Charles I., 1628, when Sir John Stewart of Traquair, Knight, was raised to the peerage as Lord Stewart of Traquair, and shortly afterwards elevated to the dignity of Earl of Traquair, Lord Linton, and Caberston. In looking into history, we cannot discover that this gentleman had a single good quality. Like too many at that period, he was a time-server, devoid of anything like settled principle. In politics and religion he discreetly sided with the uppermost—a Puritan or an Anglican of the Laud type, whichever seemed to promise to pay best.

There is a very curious old book, which few know anything about, called the '*Staggering State of Scots Statesmen, for one hundred years from 1550 to 1650*, by Sir John Scot of Scotstarvit.' It was printed from a manuscript in 1754, and is exceedingly rare. This little book is full of amusing gossip about the wretchedly struggling noblemen and officers of state at that unhappy period of Scottish history, during a large portion of which the central ruling authority was in London, and only a delegation of subordinates, who domineered at will, in Edinburgh. These subordinates were needy Scotsmen, of whom for more than a century hardly a good word can be said.

They did as they liked, plundered and tyrannised without mercy. The *Staggering State* gives an awful account of them. Among the whole, none was such an adept at looking to his own interest as the newly created Earl of Traquair. Appointed Lord High Treasurer, he 'managed matters so nimbly' that in a short time he was able, by purchase, to vastly extend the possessions of the family. He also enlarged the old mansion at Traquair, and made a handsome avenue lined with trees as an approach.

When Charles I. got into trouble, the Earl of Traquair for a time stuck to his cause, which in a half-hearted way he afterwards thought fit to desert. The Commonwealth under Cromwell proved a sore trial to every class of home-rulers in Scotland. A stern system of honesty and justice was introduced, at which the native nobility and judges stood aghast. Monopolies were abolished. Free trade was established between England and Scotland. Very hard all this on those who had been pocketing the public money, thriving on monopolies, and selling justice to the highest bidder. Turned out of office, and his estate being sequestered, the Earl of Traquair was ruined. By some manoeuvre, his son Lord Linton had the address to save for himself and his heirs at least a portion of the family property, and was able to keep house at Traquair, while the Earl was exposed to vicissitudes, uncheered by public respect or sympathy. Lord Linton can hardly be acquitted of having acted an unnatural part towards his father. He allowed him to drop into such extreme poverty that he was fain to accept an alms from an old friend, and to dine on a salt herring and an onion. Broken in spirit, he died in 1659; and as evidencing the meanness of his circumstances, it is recorded that at his burial there was no pall, but only a black apron over the coffin.

So ended the first Earl, who though not without the faults common to the period, was at least an historical personage. His son, the second Earl, was noted only for scandalous irregularities, and by him Roman Catholicism was introduced into the family, through his marriage with Lady Anne Seton. He was succeeded by his elder son, William, as third Earl; and he was succeeded by his brother, Charles, as fourth Earl, who married Lady Mary Maxwell, daughter of the fourth Earl of Nithsdale. We need say nothing of the fifth Earl. In the sixth Earl we begin to have a living interest. He had a son, Charles, and three daughters, Christiana, Mary, and Lucy. Lady Christiana caused serious trouble in the family by what was deemed a *mésalliance*. The story is that she fell in love with a young man named Griffiths, who as a lawyer's clerk had visited Traquair on some piece of business, married him—and was disowned. There is no doubt of the marriage, whatever might have been the position of Mr Griffiths; for it is recorded in the *Peerage* of Sir Robert Douglas. Descendants of Lady Christiana are still living, we believe, in America.

The Ladies Mary and Lucy do not appear to have been married. As 'genteel spinsters' they lived in the Canongate, Edinburgh, which even in their time had not been entirely deserted by noble families. Charles, their brother, who succeeded as seventh Earl in 1779, and was already married, dwelt for a time in Edinburgh. There to him was born a daughter, Louisa, 20th March 1776; and a son, Charles, 31st January 1781. After the birth of the two children, the Earl and his Countess spent most of their time at Traquair House. Here, for a number of years the Earl flourished, if it can be called flourishing, the more appropriate term being vegetating, at the period when Window Willie was in his glory.

There lingered some traditions of the Countess of Traquair in our young days. She was an invalid. The rumour in Peebles was that she had been afflicted with an 'eating cancer in her great toe.' Whether there was any truth in the report we cannot tell. All we know is, that the ailment of her Ladyship gave rise to a droll and popular myth. The cancer being an 'eating' cancer, required something to eat. If it was not properly provided with food, it would eat off her Ladyship's foot, and finally eat her up bodily. To avert this calamity, it was customary—so ran the legend in Peebles—to provide the cancer every morning regularly with a fresh pigeon, which it devoured with a relish in the course of the day, and so the foot of the Countess was luckily saved. The gossip about the daily consumption of a pigeon was possibly a piece of nonsense. At anyrate, the Countess having been much of an invalid, the old Earl her husband sought to amuse himself in a way, immediately to be specified.

We are now ready for the interview with Window Willie, who has been jogging on his way to Traquair. For the last hour the Earl had been expecting him, and now and then looks out from a small apartment with a low ceiling to see his approach down a side avenue. There at length he comes on his little white pony; and giving the animal to a groom, he enters the antiquated mansion.

'Glad to see you,' said the Earl. 'I've been out of work for a week; at least hardly anything to do. I hope you have brought something. How many have you got?'

'Well, my Lord,' replied Willie, 'I think I have made a pretty good haul. I have just returned from my circuit in the western district of the county, and have managed to pick up a round dozen.'

'That will do capitally. Lay them out carefully in a row, and tell me to whom they belong.'

So requested, Window Willie disburdened himself by drawing from his pockets a dozen razors in their respective cases, some of them having a very common appearance, and he proceeded to arrange and specify them as follows:

'There's one from Dickson of Hartree; one from Loch of Rachan; one from Murray at Drachal;

one from Kerr, minister of Stobo; one from Marshall, minister of Manor; and one from Bowed Davie; it's sair lippit, but it will stand grunden. That makes six. Then comes one from Mr Findlater, the minister of Newlands; next one from Sir James Naesmyth; one from Robbie Symington at Edston; one from Mr Alexander at Easter Haprew; one from Toll Tammie at the Neidpath, which I got yesterday in passing; and last of all, one from your lordship's friend and adviser, Commissary Robertson, at Peebles. That makes the dozen.'

The row of razors made a splendid array, and put the Earl in high spirits. Window Willie must stay to dinner to talk over his adventures in securing the razors, for each has its story, which will furnish some amusement. Willie, of course, as he had expected, dines with the Earl, and pops home to Cabbage Hall in the evening.

Not to keep the reader in suspense: The Earl of Traquair had a profound passion for sharpening razors. Thankfully and gratuitously his Lordship sharpened not only all the razors of his tenants and their servants, but of all the landed gentlemen, farmers, and traders throughout the county who would favour him with a commission of the kind. In his time, no one in Peeblesshire needed to torture himself by shaving with a blunt razor. Of course, the razors were not sent for sharpening in a business fashion. Window Willie's professional rounds gave him an excellent opportunity of collecting razors for the Earl, and of returning them properly cuttled to their proprietors. When he brought one batch he took away another. It was a satisfactory arrangement all round. The Earl was delighted to be kept working at his favourite pursuit; people were glad to get their razors on all occasions sharpened for nothing; and Window Willie was pleased to have an employment which made him everywhere an acceptable guest, and afforded opportunities of visiting at Traquair. I happen to have an agreeable remembrance of various persons in Peebles telling me several of the foregoing particulars, and of how Window Willie used to call to ask if their razors did not want a little touching up, as he was going next day to visit the Earl.

The world was not then constituted exactly as it now is. Nobody thought there was anything particularly strange in an Earl sharpening razors as a recreation. It was a harmless hobby; and, besides, there was a gratification in thinking that your razor was put in trim by a nobleman. The Earl of Traquair was a general benefactor. He was a sort of artist. He should have been born and bred a cutler, in which capacity he excelled; but as he had the misfortune to be born an heir to an earldom, he had just to make the best of it. As for Window Willie, he seemed to have been born to be the Earl's provider with blunt razors to be sharpened; in which line he acquitted himself admirably. Working to each other's hands, they in their time kept the county well and comfortably shaved, and that is saying a good deal in the way of eulogium.

The Earl had another eccentricity. He did not patronise London or Edinburgh tailors. After some experience, he had a firm belief that no man could make clothes for him that would thoroughly fit but Thorburn, a tailor at Eddleston, a small

village of forty to fifty houses, close to ~~Barnhill~~ the residence of Lord Elibank. We have ~~never~~ heard how the Earl discovered Thorburn; in all likelihood he heard of him through his factotum, Window Willie, who knew something of everybody. Having tried, he stuck to Thorburn. One thing materially guided this selection. Thorburn was exactly his own shape, body, legs, and arms. That was a great point. The Earl had an invincible hatred of putting on new-made clothes, which required some time to settle down into the required figure, and were at first a little awkward. Thorburn was an accommodating fellow. He volunteered to wear the Earl's new clothes for a day or two, to give them a set. The obliging offer was accepted. When the Earl wanted a new pair of black velvet breeches, Thorburn took care to wear them for a Sunday at church, which gave the legs the appropriately round baggy form, and then they were ready for use. By the agency of Window Willie and his little pony, the garment safely reached Traquair House.

Dear old Earl, and dear good-hearted Window Willie! Both have long since passed away. The beards of the county are said to have been sensibly affected by their decease. Charles, the eighth Earl, had unfortunately none of his father's aptitude for razor-sharpening. As a bachelor and a recluse, he was mainly noted for effecting improvements on his various farm-steadings, which was by no means a bad hobby for a nobleman. Partly perhaps on account of a stammering in his speech, he shrank from general society, and vegetated till the last in the queer antiquated mansion of his forefathers, in the society of his only sister, Lady Louisa Stuart. We had the honour of several interviews with him in relation to railways for the district, and could not help feeling pained with that distressing stammer. A very curious fact afterwards came to our knowledge. The Earl having spent a number of his early years abroad, acquired a proficiency in speaking French, which he ever afterwards retained. When he spoke French, he never stammered! At his decease in 1861, the male line and peerage became extinct; and on the death of Lady Louisa Stuart in 1875, in the hundredth year of her age, all the family had departed, the property devolving by will on a distant relative. Traquair House, which looks like two ancient feudal keeps rolled into one, remains embosomed in trees almost as it was left by the Lord High Treasurer upwards of two hundred years ago, and as it used to be visited of old by Window Willie. w. c.

THE LAST OF THE HADDONS.

CHAPTER XXVI.—PREPARATION.

GREAT was my relief the next day when, on Lillian and I returning from a ramble in our beloved woods, we heard Robert Wentworth talking to Mrs Tipper in the parlour. But at first sight of him, I shrank back. How altered he looked, how terribly altered since we had last met! The kind little lady's hurried explanation as we entered the room, that illness had kept him away, gave me another blow, and he saw that it did.

'Only a sort of cold,' he cheerfully explained, extending his hand towards me with a smile. 'How do you do, Mary?'

My own hand shook; but he kept it long enough

in his own to steady it, giving me a reassuring look before releasing it.

But Lilian could not get over the shock which the first sight of him had given her, involuntarily exclaiming: 'But I fear you have been ill—very ill; and it has made you quite'—She paused, not liking to go on; but he lightly replied: 'Gray, do you mean? My dear Lilian, the gray season had set in long ago, only you saw me too frequently to notice it.'

Mrs Tipper laid her hand for a moment on his shoulder as she passed him on her way out of the room to prepare some special dainty to tempt him at tea-time; and I noticed that she was looking much graver than usual.

'And how have you been going on with your work during my absence?' he asked; 'not carelessly, I hope? I am in the humour to be very exacting and critical to-night; so you must not expect me to treat sins of omission or commission with my usual amiability.'

'Amiability, indeed!' ejaculated Lilian. 'The idea of your setting up for being amiable! I do not consider you at all considerate and good-natured to failure, sir.'

He smiled. 'I certainly have not much sympathy with failure'; it would not be orthodox, you know. But get out your work, and let me find a safe outlet for my savage propensity.'

He saw that it did me good to be taken to task in the old fashion; and was quite as unsparing as I could desire, when he came upon any error. Whatever it cost him, Robert Wentworth succeeded in setting my heart as well as theirs at rest before he took his departure that night. If Mrs Tipper saw something of the truth, she shewed her consideration for me by carefully avoiding to give any expression to her thoughts. Lilian evidently guessed nothing. She openly expressed her surprise and regret at the alteration which she perceived in him.

'I really felt quite shocked for the first few moments,' she said. 'Even serious illness does not seem quite to account for such an alteration as there is in him. He looks as though he had suddenly grown old. Do not you think so, auntie?—Don't you, Mary?'

Mrs Tipper was silent, leaving me to reply, though I knew that she was watching me somewhat closely the while. It required all the nerve and self-command I could muster to make something like a suitable reply; but I did make it; and Lilian at anyrate remained in ignorance of the true state of the case, although her ignorance occasioned me almost as much pain as her knowledge of it would have done, so very closely did she sometimes approach to the truth, in her speculations as to the possible and probable cause of the change which had taken place in Robert Wentworth.

I was becoming restless and anxious from more causes than one. The time of Philip's expected arrival was drawing near, and my news remained still untold. Whilst I was ashamed of my reticence with two such friends, the difficulty of approaching the subject seemed rather to increase than diminish. My uneasiness was becoming apparent too; even Lilian and Mrs Tipper were beginning to notice a difference in me, which they could not account for.

The dear little lady once ventured a few words

to me to the effect that no good man could be the worse for loving a woman, though she could not return his love; fancying, I believe, that possibly I was uneasy upon Robert Wentworth's account. I could only kiss the hand laid so lovingly upon mine.

It so happened that just at this juncture Mrs Tipper required sundry little housekeeping errands done in town; and partly to be alone a few hours, partly to do a little shopping for myself, I volunteered to go for her.

'Are you sure you would prefer going, dear Mary?' said Mrs Tipper anxiously; 'the days are so hot, and the things could be sent down, if we write, you know.'

I murmured something about wanting to replenish my wardrobe a little, and she easily acquiesced: 'To tell the truth, my dear, I *should* prefer your choosing the patty-pans,' she candidly allowed, when she found I really wished to go. 'Becky and I will think over all we require, and make a list,' she added, trotting off in high-feather to compare notes with Becky in the kitchen. If we were proud of our 'drawing-room,' Mrs Tipper was quite as proud of her kitchen. 'There is a place for everything and everything in its place, my dear, clean and ready to hand.' Becky in the evening, seated in state, surrounded by her brilliantly burnished tins, was a sight to behold. Nothing would have delighted her mistress and herself more than a sudden invasion of company as a test of their resources. Lilian and I were sometimes taxed beyond our powers, in our endeavours to shew our appreciation of the little dainty cakes, patties, &c. set before us. Indeed we had more than once consulted together upon the advisability of suggesting a party of children from the village to relieve us.

Lilian looked, I thought, a little surprised at not being invited to accompany me on my expedition to town. But if she was surprised, she was not offended; sensitive as she was, there was as little self-love in Lilian as it is possible for any human being to have. Hers was not fine-weather friendship. She was content to stand quietly aside until I should need her, without any complaints about being neglected, or what not, which half-hearted people are so apt to make at a fancied slight. She knew that I loved her, and I knew that she loved me, and we could trust each other, without the repeated assurance of it, which some people seem to require.

She was only a shade or two more tender and loving in bidding me good-bye, when I set forth in the morning, anxious to make me feel that my return would be eagerly looked for; and whispering a little jest about the necessity for bringing back a good appetite. 'Auntie and Becky will be sure to be busily engaged in preparing treats all day, you know; so you must come home hungry, whatever you do. And do not forget your promise to buy a pretty bonnet, Mary, and leave off that old dowdy thing; it makes you look as though nobody loved you, which is not fair to your sister Lilian. And oh, Mary, I had almost forgotten; if you bring any of this back, I shall say you don't care for me in real earnest;' pressing a little roll of paper into my hand.

I knew that she was genuinely disappointed when I proved to her that I had as much as five-and-twenty pounds in hand; and so I was obliged

to promise to take from her store for my next need. 'Or else one may just as well not be a sister,' she said, with a discontented little shake of the head.

How cheering it was—how precious the knowledge that I was cared for in this way! And there was dear old Mrs Tipper too! I thought I knew why she was desirous just at that season to make me feel that my presence was so much required at the cottage.

'I wanted to ask you to cut out the little pinafores for Mercy Green's child, Mary; but they must wait till to-morrow, I suppose. And there's the curtains for my bed, dear; nobody would fit them to please me but you;' and so forth, and so forth, until the last moment, when Lilian accompanied me as far as the stile.

As I walked across the fields in that lovely August morning, while the bright sun was

Kissing with golden face the meadows green,
Gilding pale streams with heavenly alchemy,

my thoughts attuned themselves to the summer sights and sounds, and I shook off the morbid doubts and fears which had so beset me of late. I resolved to be no longer so weak and unfriendly as to keep the truth from Mrs Tipper and Lilian. It really was unfriendly not to tell them what I knew they would both be glad to hear! That very evening my secret should be told, and I would at once begin brushing up for Philip, making up my mind to overcome my shyness for finery, and render myself as attractive as possible within the compass of—five-and-twenty pounds. It appeared to me a very large sum to spend at once upon finery, and I could only hope the end would justify the means. As it chanced, I really knew very little about Philip's taste in such matters. The selection of the modest outfit which was purchased for me nine years ago, I had been only too glad to leave to my dear mother's judgment, and we had been neither of us inclined to trouble Philip with *chiffon* talk.

But I told myself that I really must make a beginning now, as I stood in the milliner's show-room, somewhat dolefully contrasting my appearance with that of the elegant-looking beings around me; wondering whether Philip would wish me to look like them, and in that case, whether it would be possible to make me do so.

I had been striving so earnestly and anxiously to make myself worthy to be his companion, and it had seemed of so little consequence what I looked like during his absence, beyond being attired with the dainty neatness befitting a gentlewoman, that I now appeared quite behind the times. I suddenly began to realise that I had carried my disregard of pretty things too far; and was seized with a desire to try what extraneous aid could do for me.

I anxiously studied my face and figure in the large glass, and then those of the obliging shopwoman, who displayed an endless assortment of pretty things for my selection. She was about my own age, and possessed no greater natural advantages than I myself could boast of; and yet how very different was the general effect of her appearance; how dowdy I looked beside her. Yes; Lilian was quite right; 'dowdy' was the proper word for me, from head to foot.

A little shyly and consciously, I ventured out

of my shell, and appealed to the shopwoman for assistance, taking her so far into my confidence as to confess a desire to be modernised and made more attractive.

She displayed more interest in the matter than I had ventured to hope for; and we gravely discussed my capability of improvement. But I found that the complications would be so many, and the changes in the way of adaptation of hair, figure, &c. so endless, that I presently began to grow very impatient; and when she said something about the possibility of the present fashion only lasting another two months, I gave it up in despair. If I were quite sure it would serve for the rest of my life, I would go through it all; but for the fashion of an hour; no! I would be content with a simply made dress or two, and depend upon my own taste for the finishing touches. Some of my mother's old point, and a crimson bow or two for the pretty gray dress, and amber with the black silk, and such like, I trusted might please Philip's artistic taste as well as though I were in the latest fashion. And I pleased myself with the remembrance that he used to admire my method of dressing my hair in large coils round a comb; saying that it suited my head and Spanish style of face. 'Spanish! Yes; that certainly was the word,' I told myself, dwelling pleasantly upon the one only compliment I could recollect having received from Philip.

I tried to satisfy myself this way; nevertheless I was a little out of spirits at finding myself so different from other women whom I met as I walked through the park on my way to the railway station, and whom I scanned with curious critical eyes, trying to understand the intricacies of their toilets, and failing to obtain anything more than a general impression that the *tout ensemble* was very effective. The home dress might be compassed; but how if it turned out that Philip wished his wife to look picturesque and attractive out of doors—not in Mrs Trafford's style, but in Lilian's more refined way of being in the mode! I would take Lilian into my confidence at once, and she would help me. That very night I had determined to make the truth known to her and to Mrs Tipper; and after it was once known, the dress question could be entered upon.

THE STORY OF THE PRISM.

WHEN we see the brilliant colours reflected by the glass lustres and chandeliers which are now so commonly used for decorative purposes, we seldom bestow a thought upon them, regarding them as things too common, perhaps too trivial to be worthy of any particular attention. We are content to know that a triangular piece of glass will exhibit certain bright colours—they look very pretty, and it does not matter much how they happen to be there. This is the common way of dealing with the natural phenomena which meet us at every turn in this wonderful world in which we live. The progress of civilisation, with all its triumphs of Science and Art, would indeed have been slow, if not altogether at a dead-lock, if every one had been content to treat such matters in this summary fashion. But happily, this has not been the case, for certain intellectual giants have from time to time arisen, who have grappled with these

things, and have devoted their lives to their investigation.

Such a one was Sir Isaac Newton, who just about two centuries ago, with rough appliances fashioned by his own hands, inquired into the meaning of the colours to which we have just alluded. We cannot do better than quote his own words, from a letter which he addressed to the Royal Society in 1672; for his statement is so clear that a child can easily understand what he means. 'I procured me a triangular glass prisme,' writes he, 'to try therewith the celebrated phenomena of colours. And in order thereto having darkened my chamber and made a small hole in my window-shuts to let in a convenient quantity of the sun's light, I placed my prisme at his entrance, that it might be thereby refracted to the opposite wall.'

He goes on to say how surprised he was to find that the ray of light, after passing through the prism, instead of being thrown upon the wall in the form of a round spot, was spread out into a beautiful coloured ribbon; this ribbon being red at one end, and passing through orange yellow green and blue, to violet at its other extremity. Upon this experiment is founded the theory of colour, which with few modifications, still remains unquestioned.

It was not until the beginning of the present century that this experiment of Newton's (repeated as it had doubtless been in the meantime by many philosophers) was found by Dr Wollaston to possess certain peculiarities which defied all explanation. He found that, by substituting a *slit* in the shutter of the darkened room for the round hole which Newton had used, the ribbon of colour, or spectrum as it is now called, was intersected by certain dark lines. This announcement, although at the time it did not excite much attention, led to further experiments by different investigators, who, however, vainly endeavoured to solve the meaning of these bands of darkness. It was first observed by an optician of Munich that they never varied, but always occupied a certain fixed position in the spectrum; moreover he succeeded in mapping them to the number of nearly six hundred, for which reason they have been identified with his name, as 'Frauenhofer's lines.'

In 1830, when improved apparatus came into use, it was found that the number of these lines could be reckoned by thousands rather than hundreds; but their meaning still remained a puzzle to all. By this time Newton's darkened room with the hole in the 'window-shuts' had been, as we have just said, greatly improved upon. The prism was now placed in a tube, at one end of which was a slit to admit the light, while the retina of the observer's eye received the impression of the spectrum at the other end. This is the simplest form of the instrument now known as the spectro-scope, and which is, as we have shewn, a copy in miniature of Newton's arrangement for the decomposition of white light into its constituent colours.

We must now go back a few years to record some experiments carried out by Herschel, which, quite independent of the spectro-scope, helped others to solve the problem connected with the dark lines. He pointed out that metals, when rendered incandescent under the flame of the blow-pipe, exhibited various tints. He further suggested that as the colour thus shewn was dis-

tinctive for each metal, it might be possible by these means to work out a new system of analysis. A familiar instance of this property in certain metals may be seen in the red and green fire which is burned so lavishly during the pantomime season at our theatres; the red owing its colour to a preparation of the metal strontium, and the green in like manner to barium. Pyrotechnists also depend for their tints not only upon the two metals just named, but also upon sodium, antimony, copper, potassium, and magnesium. Wheatstone also noticed the same phenomena when he subjected metals to the intense heat of the electric current; but it was reserved for others to examine these colours by means of the spectro-scope. This was done by Bunsen and Kirchhoff in 1860, who by their researches in this direction, laid the foundation of a totally new branch of science. They discovered that each metal when in an incandescent state exhibited through the prism certain distinctive brilliant lines. They also found that these brilliant lines were identical in position with many of Frauenhofer's dark lines; or to put it more clearly, each bright line given by a burning metal found its exact counterpart in a dark line on the solar spectrum. It thus became evident that there was some subtle connection between these brilliant lines and the dark bands which had puzzled observers for so many years. Having this clue, experiments were pushed on with renewed vigour, until by some happy chance, the vapours of the burning metals were examined through the agency of the electric light. That is to say, the light from the electric lamp was permitted to shine through the vapour of the burning metal under examination, forming, so to speak, a background for the expected lines. It was now seen that what before were bright bands on a dark ground, were now dark bands on a bright ground. This discovery of the reversal of the lines peculiar to a burning metal, when such metal was examined in the form of vapour, led to the enunciation of the great principle, that 'vapours of metals at a lower temperature absorb exactly those rays which they emit at a higher.'

To make this important fact more clear, we will suppose that upon the red-hot cinders in an ordinary fire-grate is thrown a handful of saltpetre. (This salt is, as many of our readers will know, a chemical combination of the metal potassium with nitric acid—hence called nitrate of potash, or more commonly nitre.) On looking through the spectro-scope at the dazzling molten mass thus produced, we should find that (instead of the coloured ribbon which the sunlight gives) all was black, with the exception of a brilliant violet line at the one end of the spectrum, and an equally brilliant red line at the other end. This is the spectrum peculiar to potassium; so that, had we not been previously cognisant of the presence of that metal, and had been requested to name the source of the flame produced, the spectro-scope would have enabled us to do so without difficulty. We will now suppose that we again examine this burning saltpetre under altered conditions. We will place the red-hot cinders in a shovel, and remove them to the open air, throwing upon them a fresh supply of the nitre. We can now examine its vapour, whilst the sunlight forms a background to it; when we shall see that the two bright coloured lines have given place to dark ones. This experiment will

prove the truth of Kirchhoff's law so far as potassium is concerned, for the molten mass first gave us the bright lines, and afterwards by examining the cooler vapour we saw that they were transferred to bands of darkness; in other words they were absorbed. (In describing the foregoing experiment, we have purposely chosen a well-known substance, such as saltpetre, for illustration; but in practice, for reasons of a technical nature, a different form of potassium would be employed.) Kirchhoff's discovery forms by far the most important incident in the history of the spectroscope, for upon it are based the new sciences of Solar and Stellar Chemistry, to which we will now direct our readers' attention.

The examination of the heavenly bodies by means of the spectroscope has not only corroborated in a very marvellous manner the discoveries of various astronomers, but it has also been instrumental in correcting certain theories and giving rise to new ones. The existence of a feebly luminous envelope extending for hundreds of thousands of miles beyond the actual surface of the sun, has been made evident whenever an eclipse has shut off the greater light, and so permitted it to be viewed. The prism has shewn this envelope, or chromosphere as it is called, to consist of a vast sea of hydrogen gas, into which enormous flames of magnesium are occasionally injected with great force. (We need hardly remark that these facts are arrived at analogously by identifying the absorption lines with those given by the same elements when prepared artificially in the laboratory.) This chromosphere can, by the peculiar lines which it exhibits in the spectroscope, be made manifest whenever the sun itself is shining.

The foregoing discovery has given astronomers the advantage—during a transit of Venus—of viewing the position of the planet both before and after its passage across the sun's disc; for it is evident that the presence of an opaque body in front of the chromosphere will cut off the spectral lines in the path which it follows; so that although the planet is invisible its exact place can be noted. From a comparison of these lines with those that can be produced in the laboratory, it is rendered probable that no less than thirteen different metals are in active combustion in the body of the sun. From certain geological appearances, it is conjectured that our own earth was once in this state of igneous fusion, and although our atmosphere is now reduced to a few simple elements, it must once have possessed a composition as varied as that of the sun. As it is, the air which we breathe gives certain spectral lines. These are much increased in number when the sun is low, and when therefore it is viewed through a thicker medium. In this case the blue and green rays are quickly absorbed, while the red pass without difficulty through the denser mass of air, thus giving the setting sun his blood-red colour. It will now be readily understood how, by means of the spectroscope, the existence of atmosphere in the superior planets can be verified. What a world of conjecture is thus opened out to us! for the existence of atmosphere in the planets argues that there are seas, lakes, and rivers there subject to the same laws of evaporation as those upon our own earth. And if this is so, what kind of beings are they who inhabit these worlds? The moon shews no trace of atmosphere, so that we may assume that if there be living beings there,

they must exist without air and without water. The lines given by the *moon* and *planets* being in number and position identical with those belonging to the solar spectrum, is a further proof, if any were needed, that *their light is borrowed from the sun*.

The varied colours of the fixed stars may be assumed to be due (from what we have already stated with regard to metallic combustion) to their chemical composition; and the spectroscope, by the distinctive lines which it registers, renders this still more certain. Their distance from us is so vast, so immeasurably beyond any conception of space that we can command, that the detection of their composition is indeed a triumph of scientific knowledge. It has been calculated that if a model of the universe were made in which our earth were depicted as the size of a pea, the earth itself would not be one-fifth large enough to contain that universe.

If we marvel at the extraordinary skill which has brought these distant spheres under command of an analytical instrument, we must wonder still more when we are told that the spectra of these bodies can be brought within range of the photographic camera. This has lately been done by the aid of the most complicated and delicate mechanism; the difficulty of keeping the image stationary on the sensitive collodion film during the apparent motion of the stars from east to west, having only just been surmounted. This power of photographing the spectrum is, (as we hinted in a recent paper on Photographic Progress) likely to lead to very great results, for the records thus obtained are absolutely correct, and far surpass in accuracy the efforts of the most skilful draughtsman. It must be understood that in all these researches the spectroscope is allied with the telescope, otherwise the small amount of light furnished by some of the bodies under examination would not be enough to yield any practical result.

The clusters of matter which are called nebulae, and which the most powerful telescopes have resolved into stars, are shewn by the prism to be nothing but patches of luminous gas, possibly the first beginnings of uncreated worlds. Comet-tails are of the same nature, a doubt existing as to whether their nuclei borrow their light from the sun or emit light of themselves. We may close a necessarily brief outline of this part of our subject by stating that it is possible that the spectroscope may some day supplant the barometer, more than one observer having stated that he has discovered by its aid signs of coming rain, when the latter instrument told a flattering tale of continued fine weather.

We have merely shewn hitherto how the spectroscope is capable of identifying a metal; but its powers are not limited to this; for by a careful measurement of the length of the absorption lines, a very exact estimate of the *quantity* present can be arrived at. This method of analysis is so delicate that in experiments carried on at the Royal Mint, a difference of one ten-thousandth part in an alloy has been recognised. Neither must it be supposed that the services of the spectroscope are confined to metals, for nearly all coloured matter can also be subjected to its scrutiny. Even the most minute substances, when examined by the microscope in conjunction with the prism, shew a particular spectrum by which

they can always be identified. Nor does the form of the substance present any difficulty in its examination, for a solution will shew the necessary absorption bands. Blood, for instance, can be discovered when in a most diluted form. To the physician the detection of the vital fluid in any of the secretions is obviously a great help to the diagnosis of an obscure case. But in forensic medicine (where it might be assumed that this test would be of value in the detection of crime) the microscope can identify blood-stains in a more ready manner.

The simple glass prism as used by Newton, although it is the parent of the modern spectro-scope, bears very little resemblance to its gifted successor. The complicated and costly instrument now used consists of a train of several prisms, through which the ray of light under examination can be passed by reflection more than once. By these means greater dispersion is gained; that is to say, the resulting spectrum is longer, and consequently far easier of examination. A detailed description of the instrument would be impossible without diagrams, but enough has been said to enable the reader to understand theoretically its construction and application.

It will be understood that we have but lightly touched upon a phase of science which is at present quite in its infancy. It is probable that many more remarkable discoveries will in course of time be due to the prism. Already, within the past twenty years, four new metals have by its aid been separated from the substances with which they were before confounded; and although they have not at present any commercial value, we may feel sure that they have been created for some good purpose not yet revealed to us. There are signs that the spectroscope will some day become a recognised adjunct to our educational appliances. It is even now included under the head of Chemistry in the examination of candidates for university honours, and there is no doubt that it will gradually have a more extended use. Many years hence, when generations of School-Boards have banished ignorance from the land, the spectroscope may become a common toy in the hands of children, enabling them to lisp:

Twinkle, twinkle, little star;
We know exactly what you are.

THE ROMANCE OF A LODGING.

IN TWO CHAPTERS.—CHAP. I.

'WHERE to, ma'am?' inquired cabby as he opened the door of his vehicle to a lady and her son who had just arrived by the evening train at Victoria Station.

'I want apartments somewhere in the neighbourhood of Chelsea; drive on until you find them: they are procurable, I suppose?' the lady replied as she took her seat.

'I do hope we may find a lodging,' she remarked to her companion, after they had been driving what appeared to her a very long time. The lad made no reply, being of a phlegmatic temperament, that finds speech an exertion unless distinctly necessary.

The lateness of the hour together with the influx of visitors, owing to the London season being then in full swing, made the search a difficult one; they were about to give up its continu-

ance and go to an hotel, when the cabman good-naturedly proposed making one more attempt, and drove down a fresh street. Stopping at a baker's shop on the way, he invited the assistance of those serving, as it was growing too dark to discern the cards of advertisement.

They directed him to a private house in a street adjoining, but added: 'The chances are they are let; still you might just as well try, as Mrs Griffiths has a yearly lodger who allows her to sublet sometimes; perhaps he is away now.'

'Shall we chance it, ma'am?' inquired the cabman.

'Do; I am so weary. She may be able to give us a corner for the night at least.'

When they reached the house, Mrs Griffiths—late cook in a nobleman's family, who had married the footman—appeared, and in answer to the appeal, asked hesitatingly: 'For how long?'

'We should take them for a week of course,' said the lady.

'I cannot let for so long,' she replied, after a brief calculation; 'but I can accommodate you for a couple of days, if you please; that will give you time to find other rooms.'

'Thank you very much,' said the wearied traveller gratefully, as she followed the landlady into a good-sized room on the right of the entrance-hall, and begged for lights and tea as soon as Mrs Griffiths could make it convenient to send them.

'How very fortunate we are to have found a night's lodging,' she said to the lad, who now joined her. 'I think I see an easy-chair in that corner; what a comfort!' and she sat down to rest, removing some of her heavy wraps as she spoke. 'Now at least we shall have breathing-time to consider what is best to be done after your examinations are over. I can go in search of rooms to-morrow while you are at them. I wish she would hasten with the light and tea; this darkness is oppressive. Where are you, Fred?'

'Here,' he replied, from the opposite side of the room. 'Can I do anything for you? I've seen to the luggage and paid the cabman, and now am quite ready to do justice to some tea.'

They were soon put out of their discomfort by the entrance of the landlady, bearing a handsome lamp which gave a brilliant light.

'I've brought you my gentleman's lamp, ma'am; he is away just now; that is why I have been able to accommodate you; for he's most obliging, and don't mind my letting his rooms—this one and the one inside behind the folding-doors, together with the one I have given the young gentleman upstairs, which belongs to his man-servant. May I ask what name, ma'am?'

'Mrs Arlington; and the young gentleman is my son.'

Mrs Griffiths glanced at the tall elegant woman in widow's weeds, and thought to herself: 'She looks more fit to be his sister than his mother; and is a sweet-looking lady anyway, whoever she is;' and she was glad she had taken her in and her son, if such he were. And then she bustled out of the room to prepare their meal.

As soon as they were alone, Mrs Arlington gazed around the room indifferently. It was of the usual stamp of lodging-house apartment, furnished according to the taste and means of those who take to letting for a livelihood. A dismal horse-hair

suite were the chief articles of furniture, supplemented by others which stood out in contrast against the horse-hair background—a good piano, an harmonium, a bookcase with glass doors filled with a choice selection of the best works, and an easel. On the walls hung several good paintings, one of which was the portrait of a beautiful young girl.

'Some artist must live here, I imagine,' said the lad, as he went from picture to picture examining them, finally stopping before the portrait of the young girl, that hung immediately over the chair in which Mrs Arlington sat.

'I daresay,' she replied wearily, as though it were a speculation which could not possibly concern her; and too glad of repose to be roused to any sense of curiosity upon the subject.

'Just look at this, mother; it is so pretty.'

'I cannot, Fred; I am too exhausted to turn round. I cannot possibly think of or look at any thing until I have had a cup of tea.—Ah! here it comes. Go and pour it out for me, and never mind the picture. But I forget. I am unfeeling and unnatural to tell you not to mind, for you are just at an age when young girls are beginning to possess a powerful attraction for you; but you must put the pleasing delusions out of your head until you have passed your examination for Sandhurst; that is the move-in-chief towards which all your energies must now be directed. I long to see your poor father's wishes fulfilled; and shall not feel quite contented until you are gazetted into the army; then my trust will have been accomplished. How many years is it now, Fred, since you first became my child?'

'Ten.'

'Yes; you were a little fellow when I first took you in hand as your governess, and you learnt to love me so well that your father asked me to be your mother.'

'Was that why you married him?' inquired the lad, as he brought her a cup of tea. 'Didn't you care for him for his own sake? You always seemed to.'

'Yes, since you could observe; but not at first, Fred—not at first. I had no heart for any one or anything just at that time but mayhap for a little child like yourself, who was motherless and needed tenderness. It was just such an uncared-for flower which alone could have saved me then, for I had gone through a bitter sorrow, born of my own caprice and foolishness; and through it I lost what could never be mine again. I must have died of despair, had I not set myself the task of working out my wrong-doing in atonement, if not to the person—that was impossible—at least to some one of God's creatures who might need me; and it was at that very time I took up the paper containing your father's advertisement for a governess. It served me for a suggestion and a field wherein I might find that for which I sought. I had never been a governess; but I determined to become one, notwithstanding the opposition of my family, who could not comprehend, and strongly disapproved of my taking such a step; but I carried my point through our doctor telling my mother she was wrong to oppose me, as my mind needed distraction after all I had gone through; and that my choice, so far from being reprov'd, ought rather to be commended, since I had preferred it to the

injurious remedy of a round of amusements, so invariably prescribed for distraught spirits; which need instead the healthy medicine of some reasonable duty to restore them to their former mental composure. Thus I became free to answer your poor father's advertisement, and was accepted by him for the post, oddly enough. And that is how I became your mother, Fred. I have tried to fulfil my trust; perhaps that has atoned.'

'Atoned for what?'

'Ah, never mind! I was only a young girl then, vain and imperious, because I found I possessed a most dangerous power—the power of making whom I would love me—a precious gift, which I did not know how to value rightly until — But never mind. I hate recalling by-gones.

Life is such a perpetual stumbling up hill with most of us, it is no use retarding our journey by useless retrospection; so when I am inclined to indulge in vain regrets, I always think of that heart-stirring line of the poet's, "Act, act in the living present;" and therefore, Fred, please to cut me another slice of bread and butter and give me another cup of tea, my child;' and she laughed at the application she had given to her words, which was commonplace enough to destroy all their poetry.

The way in which the boy watched and waited on her, and the look of quiet amusement and interest on his face as she spoke, shewed how thoroughly she had won his heart, and was indeed his mother, sister, friend, all in one. Yes; whatever might have been the fault of her girlhood, her subsequent years had fully atoned for it; she had used her gifts rightly in the case of her stepson, and his father, who had died about a year ago, blessing her for her unwearied devotion, and the happiness she had given him, leaving her the undisputed guardianship of his only child.

As soon as their meal was concluded she went into the adjoining room, divided by folding-doors from the one in which they had been sitting. It bore no traces of a previous occupant like the other, save for a few perfectly executed pictures which hung above the mantel-piece. She had her travelling bag in her hand as she entered, which she was about to deposit upon a table, when her eye caught sight of one of the pictures, and the bag fell to the ground as she started forward to examine the pencil-sketch.

'Impossible!' she exclaimed; and she gazed around the room helplessly, to see if she could by any means find aught therein that would throw a light upon the mystery before her; but all was void: tables, chairs, wardrobe, and dressing appliances were what met her gaze; while, like one fascinated, she continued standing before the sketch as if spell-bound.

'Are you coming soon?' inquired Fred, knocking, who, notwithstanding his disinclination to free converse, could never bear her long out of his sight when they were together.

'I will be with you in a moment,' she returned, recalling herself with no slight effort.

'What is the matter?' he exclaimed as soon as she joined him. 'You look as white as a ghost; you are over-tired, I suspect: had you not better get to sleep as soon as you can?' he inquired with concern, as he noticed that she was suffering from an amount of nervous exhaustion that alarmed him.

'It is nothing,' she returned: 'the journey was

fatiguing ;' and then her eye stole round the room with suppressed interest.

'Is that the pretty girl you wanted me to admire, Fred, just now when I was too hungry to oblige you?'

'Yes. Is she not a picture? What I should call a "stunner!"'

'When shall I ever knock the school-boy out of you, Fred?' she cried, laughing. 'You are a long way off from that refined phraseology I am labouring to inculcate. But you are right in this case. It is a beautiful picture, of what I should call a detestable character. She is, as you remark, a "stunner." There is not the least soul in her face; nothing but proud self-consciousness, as if she were saying: "I am a beauty, and I know it." Poor thing! she is to be pitied, if that is a true picture, and it looks as if it were.'

'How is she to be pitied? I don't see that at all.'

'Because you can't see yet, Fred, from your brief study of her face, that a girl like that may learn to feel at some time or another; and when she does, the lesson is generally such a painful one that few have the courage to rise above it. The artist who drew her was in no lenient mood; he could detect nothing in her but the stern facts which possibly made him suffer,' she added in an undertone, accompanied by a long-drawn sigh.—'I wish we had a book to read; try the bookcase; it may be unlocked.'

He did as she bade him; and shook his head negatively as he went first to the bookcase and then to the piano.

'The gentleman,' as our landlady calls him, is a cautious man evidently,' said Mrs Arlington. 'Well, we must not find fault with him, for his amiability towards his landlady has secured us a night's repose. I wonder if he is the artist of these pictures? I am ashamed of my curiosity, but I have a wish to know. Could you be diplomatic, Fred, and find out for me?'

'Why not ask the landlady straight out?'

'I dislike to appear so inquisitive, as it is of no moment to us who he is.'

'I don't know that. If he is an artist, he would no doubt be much obliged to us for asking. Act on that presumption. You admire the pictures, and may possibly wish to order some, or to sit for your portrait.'

'How magnificent you are, Fred! We look a likely pair—don't we?—to order pictures or sit for portraits! A hundred guineas or so are nothing to us; are they, my poor boy? Rein in your fancy. I am afraid of you in this respect, when you are once fairly launched on your own resources, as I cannot always be at your elbow, to control your lavish ideas, and our means are not large.'

'Well, I was only suggesting, you know, a ready mode of solving your difficulty about finding out who is the artist of these pictures,' said the boy as he wished her good-night.

As soon as he was gone, Mrs Arlington went cautiously round the room making a minute survey of every article, with a look of intense interest in her face, as though she were searching for a clue she could not find. Every vase on the mantel-piece she subjected to a close scrutiny, to see if possibly a card or old envelope lay concealed therein. But everything was dumb, and refused to bear the least witness as to the name or calling of the

previous occupant. Quite foiled, she sat down and fell into a profound reverie, which continued until the landlady knocked at the door, and entered to inquire if there was anything more she wanted, and when she would like her breakfast in the morning.

'Thank you; nothing more to-night; and breakfast at nine. By the way, have you any other lodgers in the house?'

'Yes, ma'am; the first floors are taken by a lady and gentleman for a month, leastways so they told me when they came; but the lady has got a maid who is that vexing I can't abear her; and I would be glad to give them notice to go if I could be sure of another party for the same time; but you see, ma'am, we who live by letting can't afford to have our rooms empty.'

'You cannot let me have these rooms, you say, beyond a couple of days?'

'No, ma'am. Mr Meredith—the gentleman—takes them by the year on the condition that they are always to be ready for him when he writes; and only this afternoon he sent me a letter to say he would be here on Wednesday.'

'Mr Meredith, did you say, was his name? An artist, I suppose? if I may judge by the pictures and the easel.'

'Dear, no, ma'am!' exclaimed the landlady, as if a discreditable imputation had been cast upon the character of her lodger by the question. 'He's got no call to earn his living, not he! He's got a place in the country, which he has let for I don't know how many years, and he keeps himself free to come and go as he likes. Such a fine noble-looking gentleman as he is! He took these rooms of me some eight years back, when I first married and set up housekeeping, because he said he liked the quiet of the place; and he keeps them by the year; but he lets me take in lodgers when he is away, so long as I don't bring children into the rooms. He has been here for a whole year at a spell; and then again he is off, and maybe we won't see him for months at a time. He is a most excellent lodger as ever was; and his man a nice civil, handy fellow, with none of them airs and graces as these mixxes of girls give themselves; but then, "Like master, like man," say I, and I've always found it so.'

'And your first floors, you tell me, you would be glad to re-let, were you sure of another tenant?'

'Yes, ma'am.'

'Very well then; as I have no maid likely to disturb you, I will take them for a month certain, if I can have them on Wednesday morning; and I will further pay you the week's rent you will have to forfeit by giving the present lodgers notice to quit summarily; but remember I only take them on this one condition. It is now Monday night, and I must move in on Wednesday morning.'

'I'll manage it for you, ma'am, even if I get a summons for it.'

'You shall be no loser in any case; I will pay all expenses; and she drew out her purse to deposit a week's rent in advance.

'Never mind it, ma'am; you look a lady as one may trust, and I'll see that you are in the rooms on Wednesday morning. I can easily put the blame on Mr Meredith, if they become very unpleasant, by saying he takes the rooms by the year; they are not to know whether he may not want the first floors this time.'

Mutually satisfied with their bargain, landlady and lodger parted for the night. On the face of the latter could be discerned a compression of the lips, which bespoke a sudden resolve she was bent upon carrying out, even though it failed in the end to prove successful.

MYSTICAL PLANTS.

HUMAN cunning and human credulity have dowered with mystery certain plants which are worthy of being considered the most beautiful and passive of created objects. One plant at least has been said to utter shrieks on being torn from the earth, and to have avenged the violence by causing the death of him who removed it. This plant was the mandragora of the poets, the mandrake of Scripture, a species of the *Solanæ* or Nightshade tribe; the belief in whose qualities as a sedative or a charm was as old as the days of the childless Rachel. Indigenous to the East, where probably its uses as an anodyne and soporific were early known to the initiated, it may be that in order to enhance the wonder of its effects, and prevent the extirpation of the root by its too common use, miraculous powers were imputed to it, and superstition hedged it round with fabled terrors.

The evil reputation of the plant procured it subsequently the name of *Atropa mandragora*, by which our oldest botanists distinguish it; a name borrowed from the most terrible of the Fates, *Atropos*, and since transferred to its relative *Atropa belladonna* (*Divale*, or 'Deadly Nightshade'). So potent and valuable were the medical uses of the root at a time when few anodynes were known, that the ancient Romans made it the subject of a weird ritual, without which they would have deemed it impious to have taken it from the earth. The operator stood with his back to the wind, drew three circles round the root with the point of a sword, poured a libation on the ground, and turning to the west, began to dig it up.

The root of the mandrake, a plant with a tap-root, frequently forked, as we see that of the radish, and covered with fibrous rootlets, was easily convertible into a grotesque likeness of the human form. In the times of Henry VIII. and Elizabeth, little images made of mandrake roots, called *abrunes*, were imported in large numbers from Germany, and found a ready sale in England. The fable of the wondrous powers of these vegetable idols was easily accepted by our superstitious ancestors; and the pedlars who travelled about from place to place with cases of them drove a brisk trade. Sir Francis Bacon had them in his mind's eye when he wrote: 'Some plants there are, but rare, that have a mossy or downy root, and likewise that have a number of thread-like beards, as the mandrake, whereof witches and impostors make an ugly image, giving it the form of a face at top of the root, and leave those strings to make a broad beard to the foot.' It is to the credit of the old herbalists Gerard

and Turner, that they both essayed, without fear of consequences, to dig up and examine for themselves the dreaded mandrake, and lost no time in publishing the fallacy of the weird stories told of it.

Saturnine and poisonous plants were those most affected by necromancers and witches—plants dwelling in shady groves like that described by Dryden in *Edipus*:

Nor tree nor plant

Grows here but what is fed with magic juices,
All full of human souls, that cleave the bark
'To dance at midnight by the moon's pale beams;

or on wild heaths, like the potent moonwort, which opened locks and unshod horses; or amidst solitary churchyards and old ruins, like the deadly nightshade and fetid henbane, hound's-tongue, and digitalis. Plants with dusky or sad-green leaves, and lurid-coloured flowers for the most part, and an ill-favoured soporific scent. Nature herself distinguishes hemlock from all others of the umbelliferous tribe by the pink or purplish spots with which its tall smooth stem is variegated. It grows by hedgerows and in waste places; its large-winged, finely-cut leaves and white umbels of flowers give no indication of its dangerous nature; but its speckled cuticle betrays it, and prevents its being rashly meddled with by rustic herb-gatherers and children.

Wolf's-bane or monk's-hood, a herb of Saturn, sacred to Hecate, and which has since figured in the floral calendar of witchcraft, had its first name from the use the Anglo-Saxons made of the juice, in which they dipped their arrows, and literally kept the wolf from the doors of their wattled huts. It was and is a brave herb for all evil purposes. Its root resembles the tail of a scorpion; its flowers, of lurid purple, have the form of a helmet; features sufficiently significant for those who sought such dangerous simples. The very scent of the flowers on some sensitive persons has produced swooning and loss of sight for several days; others it has deprived of speech; and there are instances on record of persons who have eaten of the root being seized with all the symptoms of mania. Imagine such powers in the hands of a reputed witch, malevolent enough to exercise them for reward or malice, in days when medical science itself was not without faith in magic! Dreadful as are its proved effects, the monk's-hood is a common plant in cottage gardens, where we have seen it flourishing three feet in height, crowned with its handsome spikes of purplish flowers, and little children playing with them.

Black hellebore had also a place in the category of mystical plants; the Romans removed the root with the same ceremonies as were observed in taking up the mandrake, with this distinction, that prayers were humbly offered to Apollo and Æsculapius for permission, and the operator turned to the east instead of to the west, on commencing to dig it up.

No wayside plant is more simple in appearance than the vervain, the 'holy herb' of so many

nations. Its pale lilac spike of minute flowers scarcely attracts attention, except from those who know its ancient history and uses. In the sun-worship of the ancient Persians, their magi carried branches of vervain in their hands when approaching the altar. So did the pagan priests of ancient Greece and Rome; and ages subsequently, the Druids in the forest temples of Gaul and Britain. With the Greeks and Romans, it was never absent from their religious rites. The plant was long considered to be good against witchcraft and the bites of venomous creatures; and being under the dominion of Venus, was a great beautifier; and when used in the baths of delicate women, made a fair face and took away freckles. It were 'perhaps well,' as Lord Bacon would say, to notice the agreement between various writers as to the cephalic virtues of the plant, and its remedial efficacy in taking away headache, and the 'pin and web,' or clouds and mists which darken the optic nerve. From medical to magical uses was but a step in those days, sometimes a very short one; and accordingly we find a spray of vervain used as a charm to keep houses and persons from harm, and especially from evil spirits and witchcraft. A relic of the later superstition lingers in the rhyme—

Vervain and dill hinder witches of their will.

St John's wort, by virtue of its dedication to the saint, whose birthday, according to the religious calendar, is the anniversary of the summer solstice, was said to have the power of putting to flight ghosts, demons, and even Satan himself. Jeremy Taylor, in his *Dissuasions from Popery*, enumerating certain specifics used by the priests to discover the presence of the evil one, adds, 'and specially St John's wort, which therefore they call "Devil's Flight,"' which is an anglicised rendering of the old pagan name *Fuga Demonium*, which Pliny tells us it received from its property of scaring demons; and retained in more modern times in allusion to its supposed virtues in the cure of distraction and melancholy. The Irish peasant at the present day firmly believes in the powers of St John's wort which his Church originally endorsed; and on the vigil of the saint's day, gathers bunches of the bright yellow, starry, almost scintillating flowers, and after sprinkling them with holy water, hangs them at the bed's head, and over the door, with a firm faith in the potency of the plant to preserve him and his household from evil spirits, fairies, and witchcraft. Armed with this floral charm, the wanderer through the most solitary places is as safe as on the fire-lit hill, amidst the youth of a whole village, who are dancing and making merry, and leaping through the fire to Moloch—without an idea that the revels of the sainted summer's night once meant the worship of the sun-god Belus. In days when the occult powers of certain plants were universally believed, it made part of the champion's oath, that he carried not about him any herb, spell, or enchantment, by which he might procure the victory.

Nowadays, the mistletoe generally affects old crab and apple trees, and the boughs of beech and ash; but in so-called Druidical times it appears to have flourished in the oak-groves, which these strange worshippers are said to have made their temples, and under the name of the 'All-heal

plant,' was, we are told, severed from these trees with solemn ceremonies. The mystery of its appearance—its aerial place of growth—the pale green antlered branches putting forth their pearly berries in honour, as it were, of the high festival of the winter solstice, 'the mother of the nights'—probably conduced to render it a miraculous plant. Long after Druidism was but a name, the plant retained its healing and protective properties for the populace, whose teachers strengthened their superstitious reverence for it, by calling it *Lignum Sancte Crucis* (wood of the holy cross). Amulets were made of it, and worn round the neck, to defend the wearer from enchantment and other dangers; and in more modern times, as a charm against the falling-sickness and the plague.

The yew, like the oak, was sacred to the Druids. Branches of it were anciently carried by the mourners at funeral processions, and were thrown into the grave before the coffin was lowered. The awe in which it was originally held is traceable in the traditions yet extant of its dangerous and even deadly properties. The beautiful crimson drupes scattered amongst its dark-green linear leaves were reputed poisonous if eaten. In clipping the tree, the greatest care was necessary that the operator might not inhale its dangerous fumes; while to sleep under the shade of its widespread branches, ragged and dusky as a raven's wing, was to risk sickness and even death.

The mountain-ash or rowan-tree has for ages been endowed with mystical properties in Scotland. The custom of carrying sprigs of it in the pocket still obtains in the Isle of Man, where it is extensively grown and cherished for warding off demons, witchcraft, and the evil-eye. There, on St John's Eve, crosses are made of it and hung upon the cattle, and placed over the doors, and in the eaves of barns and houses, to avert the evil influences supposed to be pernaturally active on that night. Not such the reputation of the *Lunaria*, described by Chaucer, Spenser, and Drayton as one of the most powerful of vegetable charms, and an ingredient in the most subtle spells of night-hags and enchanters. This, the homely 'Honesty' of the cottage garden, the satin flower that our grandmothers cherished, is a plant than which none more apparently harmless is to be found in the floral calendars of herbmen and gardeners. But in days when plants were supposed to bear witness in many instances to their own attributes, when certain features were sought for and believed in, as affording a key to the sympathies and properties of herbs, its round flat silvery frond shewed it to be under the dominion of the moon, and endowed with magic influences.

After all, a child's hand might have clasped the plants that were under the ban of our ancestors. Amongst the most potent of these herbal talismans were the trefoil and the wood-sorrel, the triple leaves of which symbolised the Trinity, and were on that account noisome to witches. Hence arose the custom in Ireland for the lord of the soil as well as the peasant to wear the shamrock as a preservative from evil influences, a custom annually returned to, without distinction of creed or rank, by all true Irishmen on the anniversary of St Patrick's Day—a saint it will be remembered so pure that all venomous things fled before him.

In that country, as in this, there still lingers in shady, rustic places an aged moribund belief in the occult power of plants in the hands of weird women who know how to use them.

MEMORY.

It is maintained by many psychologists that if an impression is once made upon the memory, it remains for ever. And it is undoubted that there are certain seasons of life or certain circumstances when memory is peculiarly susceptible, and when the impressions made are deep and sharp and definite. The objects familiar in childhood and youth, the texts, the hymns, and lessons then mastered become a lifelong bequest; the memory has petrified them on its tablet for ever. Sometimes the memory is in a state of spontaneous receptivity, and without any trouble on the part of the subject, the mind retains its interesting objects for years, perhaps through the whole life.

Memory develops in every sound mind almost as early as the powers of observation; and the objects about which it is employed in the earlier stage are much alike in all individuals. But very early we discern a difference in the natural affinities: one youthful reminiscent evinces a talent in finding his way to the infant school; whilst a bewildered companion of the same class uses leading-strings.

In glancing through the records of all ages and all nations, we meet with certain individuals who have been celebrated for their extraordinary powers of memory; and some of these would appear to us so wonderful, that we are tempted to disbelieve them, and place them in the list of human impossibilities. But it cannot be denied that there are numberless instances upon record, both ancient and modern, and also in our own day, of persons retaining an almost incredible recollection of a great diversity of matters, consisting in some cases of long lists of dates and names, or in others, countenances and circumstances, long since forgotten by the majority of mankind, through a lapse of time intervening.

We propose in this paper to submit to the reader a few of the many most authentic examples of retentive memory on record.

Within the range of their own experience, many of our readers must have noticed examples of quick or retentive memory. Frequently, however, these powerful memories are filled with matters of questionable value. Of such we may mention an individual well known in London by the name of 'Memory-Corner Thompson,' who was remarkable for an astonishing local memory. In the space of twenty-four hours and at two sittings, he drew from memory a correct plan of the whole parish of St James. This plan contained all the squares, streets, lanes, courts, passages, markets, churches, chapels, houses, stables, angles of houses; and a great number of other objects, as wells, parapets, stones, trees, &c., and an exact plan of Carlton House and St James's Palace. He made out also

an exact plan of the parish of St Andrew; and he offered to do the same with that of St Giles, St Paul, Covent Garden, St Clement, and Newchurch. If a particular house in any given street was mentioned, he would tell at once what trade was carried on in it, the position and appearance of the shop, and its contents. In going through a large hotel completely furnished, he was able to retain everything and make an inventory from memory. He possessed a most mechanical memory; and he could, by reading a newspaper overnight, repeat the whole of it next morning. He died in February 1843, at the age of eighty-six. Mr Paxton Hood knew a man in London who could repeat the whole of Josephus; and William Lyon, like Thompson, could read the *Daily Advertiser* overnight, and repeat it word for word next morning.

As a contrast to this, on the other hand we know an individual who travelled through a considerable extent of country, and passed through several towns he had visited before, yet was ignorant of the fact until informed of it by another traveller!

Pliny, in the seventh book of his *Natural History*, makes mention of one Charmidas or Charmadas, a native of Greece, who was the possessor of so singular a memory that he was able to deliver word for word the entire contents of any book which might be called out of a library, *without having read it*. This, however, we should be inclined to take *cum grano salis*.

Some cases are quoted of persons having a remarkable gift of learning any number of foreign languages in an incredibly short time. Mithridates king of Pontus had an empire in which two-and-twenty languages were spoken; yet it is asserted that he had not a subject with whom he could not converse in his own dialect. But in later times the royal linguist has been eclipsed by the late Cardinal Mezzofanti, who died in 1849. He had a wonderful memory for the retention of words, and with a grammatical intuition which has never been properly explained, he went on acquiring languages, till at the age of seventy he could converse in upwards of fifty, besides having an acquaintance with at least twenty more. He was at home in both of the dialects of the Basque language, the most difficult in Europe; also in the different dialects of German; with Englishmen he never misapplied the sign of a tense. Besides the foregoing, he was so far master of at least one Chinese dialect that he delivered a set speech to Chinese students at the Vatican. So conversant was he with all the dialects of each tongue that he could at once detect the particular county, province, or district to which a speaker belonged. He himself was upon several occasions mistaken for a native of totally different countries. According to his own words, as related to his friend Cardinal Wiseman, his method of studying a new language was to read straight through the grammar, and when he had arrived at the end he was master of the whole. He never forgot anything he had once heard or read.

Sir William Jones, in spite of his many duties

as a legal student, had before his death acquired so intimate a knowledge of fourteen languages, that he translated from the most difficult and obscure. Dr Alexander Murray, the learned author of *The History of European Languages*, was another of Britain's greatest linguists, who remembered every word he ever read; he had the whole of Milton by heart. The Emperor Claudius was another great memorist, also repeating by heart the *Iliad* and *Odyssey*.

It is recorded of Dr Leyden the distinguished oriental scholar, that when at Calcutta, a case occurred in which it was necessary, before deciding the issue, to know the exact wording of an act of parliament, of which, however, a copy could not be found in the Presidency. Leyden had had occasion before leaving home to read the act, and undertook to supply it from memory; and when nearly a year afterwards a printed copy was obtained from England, it was found to be identical with what Leyden had dictated.

Richard Porson had a remarkable memory. Being one day in the shop of Priestly the bookseller, a gentleman came in and asked for a particular edition of Demosthenes. Priestly did not possess it; and as the gentleman seemed a good deal disappointed, Porson inquired if he wished to consult any particular passage. The gentleman mentioned a quotation of which he was in search, when Porson opened the Aldine edition of Demosthenes, and after turning over a few leaves, put his finger on the passage. On another occasion he happened to be in a stage-coach; presently there entered into it a young undergraduate with two ladies. This young gentleman endeavoured to make himself seen very learned; presently quoting a Greek passage, which he said was from Euripides. The great Greek scholar, who was dozing at the other end of the coach, awoke at the familiar sounds, and drawing a copy of Euripides from the folds of his cloak, politely asked him to favour him with the passage. The student could not; and the ladies began to titter. Reddening, the youth said that on second thoughts, the passage he was sure was in Sophocles. Porson thereupon produced a copy of Sophocles, and again asked him to favour him with the passage. The undergraduate again failed; the ladies tittered greatly. 'Catch me!' said he, 'if ever I quote Greek in a coach again.' Stung by the laughter of his fellow-passengers, he said: 'I recollect now, sir; I perfectly recollect that the passage is in Æschylus.' His inexorable tormentor, diving again in the capacious folds of his cloak, produced a copy of Æschylus, and again asked him to favour him with the passage. The boiling-point was now reached. 'Stop! stop!' shouted he to the coachman. 'Let me out! There is a man inside who has got the whole Bodleian library in his pocket!' On another occasion, calling upon a friend, Porson found him reading Thucydides. Being asked casually the meaning of some word, he immediately repeated the context. 'But how do you know that it was this passage I was reading?' asked his friend. 'Because,' replied Porson, 'the word only occurs twice in Thucydides; once on the right-hand page in the edition which you are now using, and once on the left. I observed on which side you looked, and accordingly I knew to which passage you referred.'

Once when in the house of Dr Burney at Ham-

mersmith, with some friends, examining some old newspapers which detailed the execution of Charles I., he came across various particulars thought by some of them to have been overlooked by Rapin and Hume; but Porson instantly repeated a long passage from Rapin in which these circumstances were all recounted. Upon one occasion he undertook to learn by heart the entire contents of the *Morning Chronicle* in a week; and he used to say he could repeat *Roderick Random* from beginning to end. His stupendous memory, however, on account of his excesses, failed at last.

Dr Thomas Fuller, the worthy historian and divine, was said to have been able to repeat five hundred and nine strange names correctly after having twice heard them; and he was known to make use of a sermon verbatim if he once heard it. He once undertook to name exactly backwards and forwards every shop-sign from Temple Bar to the extremity of Cheapside, on both sides of the way—a feat of no ordinary magnitude, when we consider that in his day every house had its sign.

'Memory' Thompson boasted he could remember every shop from Ludgate Hill to the end of Piccadilly; and another person who had earned for himself the prefix of 'Memory' was William Woodfall, the printer of the famous Letters of Junius, who used to relate how he could put a speech away upon a shelf in his mind for future reference; and he was known to be able to remember a debate for a fortnight, after many nights' speaking upon other matters.

Dr Johnson was in the habit of writing abridged reports of debates for the *Gentleman's Magazine* from memory.

Two noted frequenters of the Chapter Coffee-house in Paternoster Row, in the last century, were Murray and Hammond. Murray had read through every morning and evening paper published in London for thirty years, and his memory was such that he was always applied to for dates and facts by literary men and others.

Jedediah Buxton, who resided for some weeks at St John's Gate Clerkenwell, in 1754, had such a memory that 'he could conduct the most intricate calculations by his memory alone, and such was his power of abstraction that no noise could disturb him.' Singular to relate, he never learned to read or write, though he was the son of a schoolmaster.

Eugenia Jullian, a precocious child, well known to the writer of this, at the age of five years had a book given her to read; and looking through it, she at length read a poem of several hundred lines (it must be mentioned she knew her alphabet at eleven months old, and could read at three years of age) once through; and being asked what she had read, she handed her mother the book, and repeated the whole without a mistake. Unfortunately, like most precocious children, her mind proved too powerful for a delicate constitution, and she died at an early age.

Among other possessors of very retentive memories may be mentioned the learned Pope Clement VI.; Dr Monsey, who died at Chelsea at the age of ninety-five; and Mozart, who almost in every case composed his pieces before he committed them to paper.

At the present time, Elihu Burritt possesses a remarkable memory. Born in America in 1811, he had, at the age of twenty-seven, and while work-

ing at his trade, learned fifty languages. In 1846 he came to England, and was for some time United States consul at Birmingham. Gustave Doré is the owner of a good memory; and we have it from a reliable authority, that Thomas Carlyle, 'the philosopher of Chelsea,' lays a book aside when he has read it, it being of no more use to him, having abstracted and stored up in his mind all the contents which he deems worthy of retention.

Every one has a memory, but every one has not the same natural affinities, and therefore every one does not retain with equal facility the same sort of thing. One man, from taking a glance at an object, will sketch it correctly; another could not give a correct representation were he to labour for a month. The mind of another is more for living objects, and like Cuvier or Knox, he carries in his memory the names and forms of hundreds of plants and animals. A third has a propensity for the faces of his fellow-creatures, and like Themistocles, he can name each of the twenty thousand of his fellow-citizens; or like Cyrus, he could remember the name of every soldier in his army; the like being related of L. Scipio and the Romans. The day following the arrival of Cinaes, ambassador of King Pyrrhus, in Rome, he saluted by name all the senate and the gentlemen of the city. Our own George III. had an extraordinary power of recollecting faces. The taste of a fourth is for languages, and like Mezzofanti or Alexander Murray, every word he hears or reads in a foreign tongue becomes a lifelong heritage. Another retains mathematics, the symbols of which require a peculiar cast of memory. Such a mind is generally destitute of love of colour, music, &c.; it wrestles with the artificial symbols that express the most extensively important truths of the world. The natural history memory has to do with artificial symbols, but with these it mixes the consideration of actual appearances to the senses. The taste of another is for choice, emphatic, and sublime diction; like Wakefield, he can repeat the whole of Virgil and Horace, Homer and Pindar.

The faculty of recollecting places is very large in some of the inferior animals; pigeons and some sorts of dogs have it very prominently. The falcon of Iceland returns to its native spot from a distance of several thousands of miles. And it seems likely that this has at least something to do with reference to those birds which migrate from one country to another. It seems indispensable to a successful traveller. Columbus, Cook, Park, and Livingstone must have been largely endowed with this faculty. These diversities have not been sufficiently kept in view in the important business of education, and the principle of cramming the same things into every sort of memory still too extensively prevails.

The memory may be strong where the intellect is weak; but without the former faculty there can be no intellectual growth; for is not memory the power of the mind by which it retains its possessions? If Sensation, Perception, and Attention are the collecting faculties, Memory is 'the conservative faculty'—the retainer of the collected treasures.

With the power of throwing our whole mental vigour into any given act for the time being, a strong will can generally insure a strong memory: and for understanding then and retaining after-

wards, half an hour of such absorption and concentration is worth more than the longest day of day-dreaming—though day-dreaming, as an occasional relaxation, is not to be despised.

Nowadays we are not at all surprised to see placarded about our towns large announcements of an 'eminent professor' about to arrive, under whose tuition we may be initiated into the 'Art of Memory,' whereby we may be taught to remember at will the heights of mountains, rows of dates, chronological events, and all things coming within the range of memory. It may be interesting to learn that this is no new art, for by reference to Pliny we find that the Art of Memory was invented by Simonides des Melicus, and afterwards perfected by Metrodorus Sepsius, 'by which a man might learn to rehearse againe the same words of any discourse whatsoever after once hearing.'

It does not fall within the scope of this paper to enter upon the merits or demerits of this art; but we may conveniently bring our subject to a close by relating a couple of anecdotes that bear upon it.

Upon one occasion, Fuller said: 'None alive ever heard me pretend to the *art* of memory, who in my book have decried it as a trick, no art; and indeed, is more fancy than memory. I confess, some years since, when I came out of the pulpit of St Dunstan's East, one (who since wrote a book thereof) told me in the vestry, before credible people, that he, in Sidney College, had taught me *the art of memory*. I returned unto him: *That it was not so*, for I could not remember *that I had ever seen him before!* which I conceive was a real refutation.'

Not very long ago, a lecturer upon the art of memory, whilst dining at an hotel in one of our provincial towns, was inquired for and called away suddenly; upon which he immediately finished his repast and hurried from the room. A moment or two afterwards, the waiter coming round to the chair lately occupied by the professor, held up his hands and exclaimed in astonishment: 'Goodness gracious, the memory man has forgotten his umbrella!'

GOSSIP ABOUT TAILS.

EVERYBODY knows that tails serve a great variety of purposes. To mention a few: The horse and ox use their tail to drive off troublesome insects. Some kinds of apes have long prehensile tails with which they swing themselves from branches or reach distant fruit. The kangaroo's tail forms a kind of extra leg, and is also serviceable in jumping. The beaver is said to beat with its tail the mud of which its house or dam is built, as well as to use the organ in swimming. The tails of fishes act like rudders, and in whales, for example, they are powerful propellers, as also a means of attack or defence. Birds of high flight have their tail feathers adapted as a steering apparatus; while the tails of parrots, toucans, and climbers generally, incline downwards, and aid in laying hold of trees. The tail in some reptiles is important for locomotion. Scorpions have in their tail a formidable weapon; and the noise made by the rattlesnake when roused is given from its tail.

There is a good deal of expression in tails. A cat when unexcited has her tail bent towards the ground and quiet; but when the animal is under lively emotion, the tail shews movements which are not of chance character, but predetermined by nature—such and such an emotion causing such and such a movement. When the cat feels afraid when seized, for example by the neck, the tail goes down between her legs. On sight of an agreeable morsel of meat, the tail is raised straight up. When angry, the cat bends her tail into two curves of opposite direction—the greater curve at the base, the lesser at the extremity—while the fur is erect throughout. When on the alert for prey, she lashes her tail from side to side. On the other hand, the dog wags his tail to testify joy; while (as with the cat) fear sends it down between his legs. We are all familiar, again, with the comical appearance of a herd of cattle, driven to despair by insects, rushing about a field on a hot day with their tufted tails erect as posts. Dr John Brown, in one of his racy sketches, tells of a dog of his whose tail had rather a peculiar kind of expressiveness. This tail of Toby's was 'a tail *per se*'; it was of immense girth, and not short, equal throughout like a policeman's baton; the machinery for working it was of great power, and acted in a way, as far as I have been able to discover, quite original. We called it his ruler. When he wished to get into the house, he first whined gently, then growled, then gave a sharp bark, and then came a resounding mighty stroke, which shook the house. This, after much study and watching, we found was done by his bringing the entire length of his solid tail flat upon the door with a sudden and vigorous stroke. It was quite a *tour de force* or a *coup de queue*, and he was perfect in it at once, his first *bang* authoritative having been as masterly and telling as his last.

There seems to be good reason for believing that rats sometimes use their tails for feeding purposes where the food to be eaten is contained in vessels too narrow to admit the entire body of the animal. A rat will push down his tail into the tall-shaped bottle of preserves, and lick it after he has pulled it out. A gentleman put two such jars of preserves covered with a bladder, in a place frequented by rats; and afterwards found the jelly reduced in each to the same extent, and a small aperture gnawed in the bladder just sufficient to admit the tail. Another experiment was more decisive. Having refilled the jars to about half an inch above the level left by the rats, he put some moist paper over the jelly and let it stand in a place where there were no rats or mice, till the paper got covered by mould. Then he covered the jars with a bladder and put them where the rats were numerous; as before, next morning the bladder had again been eaten through, and on the mould there were numerous distinct tracings of rats' tails, evidently caused by the animals sweeping these appendages about, in the fruitless endeavour to find a hole in the circle of paper which covered the jelly.

An example of the practice of vivisection (which is happily less common in this country than on the continent) is presented in an experiment made lately by an eminent French physiologist with the tail of a young rat. Readers are doubtless aware of the curious results that may be obtained by skin-grafting. The experimenter referred to

skinned a little portion of the tip of the rat's tail, made an incision in the back of the animal, inserted the skinned tip in this hole, and fixed it there. In course of time the wound healed, and the animal went about with its tail thus transformed into something like the handle of a teapot. After eight months the savant cut the handle in two; then on pinching the end of the part left in the back, the rat appeared to feel pain, and tried to escape. It was thus shewn that the sensitive nerves in the end of the tail had formed a true connection with the nerves in the back issuing from the spinal cord; and that they conveyed an excitation in an opposite direction to that in which they convey it normally.

The trick which came under the notice of the French correctional police will perhaps here recur to recollection. A person complained that he had been imposed upon by the purchase of an animal represented to be 'an elephant rat'; that is, a rat with a trunk and tusks resembling those of an elephant. The trunk was nothing more than part of a rat's tail stuck into the snout of the animal, where it grew as if natural. As for the tusks, they were two of the teeth in the upper jaw which had been suffered to grow by removing the two corresponding teeth in the lower jaw against which they used to grind and be kept short. More ingenious than honest, the fraud was duly punished.

Crocodiles have enormous tails; of sixty vertebrae there are more than forty which are caudal. The organ is rather cumbrous to them on land, and this fact affords an opportunity of escaping from them by making quick turns, which they do not readily follow. But their powerful tail must be of immense value to them in swimming.

There is strong probability that the tail of some animals covered with fur serves the purpose of a protection to the air-passages of mouth and nose during sleep, as also the retention of heat. This will be apparent to any one who observes the position into which the tail is curled in such cases, and the face brought into contact with it.

Frogs have no proper tails, but in the tadpole stage they have, and their locomotion by means of them is familiar to everybody. A similar mode of locomotion is observable in the minute animals termed Flagellata, which advance by lashing their tails from side to side. The motions of several of those microscopic organisms known as *Bacteria*, found in putrefying infusions of organic matter, are at present somewhat enigmatical. But they are to a certain extent explained by an interesting observation made lately by MM. Cohn and Warming. With sufficient magnifying power these naturalists have found tails in several of the *Bacteria*. They vary in number from one to three, are situated at one end of the axis of length, and capable of rapid motion; by which the movements of these minute creatures may fairly be accounted for.

The last thing we have to say on the subject is to express our gratification at the change which has taken place in treating the tails of horses. The odious and cruel practice of docking them, once so prevalent, has been happily abandoned, and the horse's tail is now left to attain its natural graceful dimensions.

THE BOARDING-OUT SYSTEM.

FORTY years ago or thereabouts, we happened to make a visit to an hospital for pauper orphan children in a large city. It was a dismal spectacle. The little creatures, seated on forms, and dressed in a poor garb, had a woe-begone appearance. Their faces were pallid, and a number of them had sore eyes. The sentiment which arose in our mind was that the whole affair was unnatural, and morally and physically unwholesome. Here was a spacious mansion kept up for the accommodation of some hundreds of poor children whom destiny had deprived of their parents. Treated well, as it was thought, according to regulations, they were evidently unhappy, and pined for that species of freedom which is only to be obtained by children brought up within the domestic circle.

Since that time, so far as Scotland is concerned, there has been a considerable revolution in the matter of juvenile pauper management. The plan of immuring a horde of orphan pauper children in large buildings under the charge of nurses and teachers is pretty generally abandoned, not so much on the score of economy as of common-sense. Nature has clearly ordained that children are to be reared, instructed, and familiarised with the world under the direct charge and responsibility of their parents. That has been the way since the beginning, and it will be so till the end of time. The family system is the foundation of everything that is valued in our institutions. Our whole structure of society rests on it. Any attempt to rear children artificially on a wholesale principle, is necessarily defective, will prove abortive, and be attended, one way and another, with bad effects.

Unfortunately there are exceptions to a sweeping rule. There can be no family system where parents are removed by death, or what is more dreadful, where the parents are so grossly dissolute as to be unfitted for their appropriate duties. In either case arises the question as to what is to be done with children who are so haplessly thrown on public charity. An answer to this brings us to the root of the matter. If at all possible, we must find

foster-parents who will do the duty of real ones to the children assigned under proper precautions to their custody. We are aware that this may not be always practicable, and where it is not, the grouping of children in some kind of asylum must still be perpetuated. Some countries appear to be more favourable than others to the plan of boarding out children with foster-parents. For the plan to have a chance of success, there must be a prevalent intelligence, with a sense of moral responsibilities, and that special condition as concerns means of livelihood which would induce a family to board a child alien to them in name and birth.

In certain parts of Scotland, the plan of boarding out pauper children has been so peculiarly successful, that we purpose to give some account of it. The children so treated are not all orphans; some are children deserted by worthless parents; some are the children of sick, infirm, or lunatic parents; some are the children of parents who are in prison or are convicts. In all cases, deep considerations of humanity have guided the poor-law authorities in dealing with them. Throughout Scotland at 1st January 1875, the number of pauper children boarded out was 4512, among whom there was nearly an equality of boys and girls. The cost of each did not exceed ten pounds per annum; that is to say, for the sum of about four shillings a week a child is respectably brought up in the house of a foster-parent. This sum covers cost of bed and board, school fees, and extras of all kinds. The child participates in the ordinary meals of the family; it goes to the nearest school with its companions, plays about with them, and acquires a knowledge of country life along with a love of natural scenery. Instead of being confined in a dull mansion under a dismal routine of discipline, with the chance of acquiring bad or at least narrow notions, the boarded-out child grows up a stout country lad or lass, and is endued with such general intelligence as is likely to pertain to the class amidst whom he or she moves. By these means, the boarded-out pauper children cease to be paupers. Forgetting their unfortunate origin, they drop insensibly into the general population. The catastrophe of

orphanism or deserted infancy is robbed of its horrors. Surely, this must be deemed one of the greatest triumphs of humanity.

Of course, the thing could not be done unless under a scrupulous system of management and general supervision. The parochial board, with whom rests the administration, needs to exercise the greatest vigilance in selecting families to whom children may be assigned. Agricultural labourers and small shopkeepers in country villages are, we believe, considered to be eligible, should character and everything else bear investigation. Nor, though boarded out, are the children lost sight of by the poor-law authorities. They are subject to the visits of Inspectors, who report on their condition. In a number of cases, the children are boarded with relatives, who may be supposed to take some special interest in them, and are not disinclined to accept a lesser board than would have to be paid to strangers. Yet the parochial boards do not appear to view with favour the practice of boarding children with relatives who are perhaps aged and infirm, or are in receipt of parochial relief on their own account. The person thoroughly suitable should be in middle life, engaged in active duties, and fit to act the part of a foster-parent. For the success of his endeavours he should be aided in every reasonable way. The child put under his charge must not wear clothes bearing the pauper stamp, but be dressed like the other children in the place. An Inspector reports on the good effects produced by the removal of pauper uniform. 'The hang-dog look of pauperism gradually disappeared from the faces of the children—they saw themselves treated as other children, and soon became as others.'

In the Reports of the Inspectors generally, we have many pleasing instances of the social value of the boarding-out system. The significant fact strongly brought out is that the children do not return to pauperism. 'When they leave school, the boys learn trades or become farm-servants, and the girls go to service like other country girls, and many of them get respectably married. When the children go to service, the family relationship is still kept up, and they return to their foster-parents as other children do to their homes, bringing at term-times, when they get their wages, presents of tea and sugar, articles of clothing, and other tokens of affectionate regard.' We learn that in some cases the children adopt the name of the family with whom they are boarded, and as a rule they are not distinguishable from the younger members of the family. Did our space permit, many valuable particulars could be added. Those who take an interest in this important question in social economics may be referred to an able and handy digest, 'Pauperism and the Boarding-out of Pauper Children in Scotland, by John Skelton, Advocate' (Blackwood and Sons, 1877). The system, it is to be observed, bears no resemblance to that vicious practice of farming-out children, which has been productive of so much demoralisation

and infant mortality. In the boarding-out of pauper children as described in the work of Mr Skelton, and now very general in Scotland, the care that is taken in selecting foster-parents, and the constant supervision to which they are subjected, give to the system its peculiar value. Whether such a system would be applicable to all parts of the United Kingdom is perhaps doubtful. It is at anyrate important to know that in Scotland it has been eminently successful, and is the theme of praise by authorities on the subject. The Inspector of the poor of Glasgow tells us that it has been in use in that city for upwards of a hundred years. How suggestive is this remarkable fact—how curious to find that in this as in some other valued public institutions, a thing may flourish and be spoken of approvingly for upwards of a century in one end of Great Britain, and yet be hardly known in another, or if known, be only treated with scepticism and indifference. W. C.

THE LAST OF THE HADDONS.

CHAPTER XXVII.—PHILIP.

I ARRIVED at the Grayleigh Station about seven o'clock in the evening, and walked slowly and enjoyably across the fields, altogether forgetting my dress-troubles as I watched the effects of the red sunset, a more than usually beautiful one. 'I must treat myself to just one look at the dear old beeches, in this light,' I murmured; forgetting fatigue and every other discomfort as I turned from the stile and went down the lane towards the woods. I was standing in mute contemplation of the sunset effects upon the different trees. The air was calm and still; not a leaf moved, as the sunlight stole amongst the majestic trees, crowning one, and robing another from head to foot with its red glory. I was accepting the rebuke with bowed head and clasped hands, when suddenly a sweet, low, girlish laugh—Lilian's laugh—rang out in the stillness, near me.

'There! I told you how it would be. I am not artist enough for that!'

'Try again,' returned a man's voice, clear and strong and in its way as musical as her own.

Whose voice—whose? For a moment I felt as though I were transfixed to the spot where I stood; then with trembling hands, softly parted the thickly covered branches which intervened between me and the speakers. Philip! My heart had already told me that it was he; and one swift glance shewed me that it was the Philip of my dreams—so improved as to bear only an ideal resemblance to the boy-lover I had parted with. He had developed grandly during the nine years we had been separated. Taller and larger in figure, his handsome bronzed face adorned with an auburn beard, whilst his gray eyes retained their old frank kindliness of expression, he looked the personification of manly strength, physical and mental.

Impulsively I advanced a step or two, then shyly and nervously shrank back again, clinging to the low outspreading branches of the tree. Presently, when my foolish heart did not beat quite so wildly—presently.

'Yes; that is better. Now a few bold strokes athwart the horizon. Have you not a coarser brush?'

'Yes. I will run in and fetch one.'

'Cannot I, Miss Maitland? Allow me.'

'O no; auntie could not tell you where to find it.' And away she ran, in the opposite direction to where I stood.

Without a moment's pause, in my anxiety for our meeting to take place whilst he and I were alone, I stepped hastily forward. He was examining Lilian's drawing, when he caught the sound of my footstep and looked up. His eyes met mine—ah Philip! ah me!—with the grave calm gaze of a stranger!

I stood utterly powerless to move or speak; and perhaps I looked more than ever unlike my past self in that moment of bitter anguish. But suddenly the truth flashed upon him.

'Great heavens—*Mary!*' he ejaculated, catching me in his arms as I swayed towards him.

I was still speechless; and looking down into my face, he added gently, it seemed to me sorrowfully: 'My poor Mary!'

'Am I so changed as that, Philip?' I murmured in a low broken voice.

'I—I fear you have gone through more than you would allow me to know about,' he replied, reddening. Adding a little confusedly: 'How was it that I did not find you at home, Mary?'

'I did not expect you quite so soon as this,' I stammered out quite as confusedly. 'You said a month or six weeks, and it is only three weeks since I received your letter.'

'I—found myself free sooner than I expected; and of course set my face homewards at once. I arrived at Liverpool last evening, and travelled all night, in order to be here in good time in the morning.'

'Did you get here this morning?'

'Yes; you had only left half an hour or so when I arrived. I should have met you, they told me, had I not taken the wrong turning from the stile.'

'Had—you a pleasant voyage?' I asked, terribly conscious that this was not the kind of talk which might be expected between him and me at such a moment.

I think he was conscious of this also. He stood a moment without replying, then every line in his face seemed to grow set and firm, and he said gravely: 'How is it that your friends here do not know that I have come to claim my wife, Mary?'

'I put off telling them from time to time,' I replied in a low voice; 'but I fully intended telling them this evening.'

'Let us go in at once,' he said hurriedly.

He drew my hand under his arm, keeping it firmly clasped in his own, and we went silently towards the cottage. Lilian was turning over the contents of a box in search of the brush she wanted, and Mrs Tipper was nodding over her knitting, fatigued with her day's exertion. Neither saw us approach, and both looked up with astonished eyes when we entered the room; and without a

moment's pause, Philip introduced me to them as his promised wife.

'We have been engaged for the last ten years,' he said hurriedly, 'and I have just been taking Mary to task for not having told you so.'

'Dear Mary, dear sister, when you ought to have known how much good it would have done us to know!' said Lilian with tender reproach.

'Better late than never, my dear,' cheerfully put in dear old Mrs Tipper, eyeing me rather anxiously, I fancied.

The ground seemed to be slipping from beneath my feet and everything whirling round. I suppose I was looking very white and ill, for Philip gently placed me on the couch, and Lilian knelt by my side, murmuring tender words of love, as she chafed my hands, whilst Mrs Tipper was bending anxiously over me with smelling-salts, &c. But I shook my head, and tried to smile into their anxious faces, as I said: 'I am not given to fainting, you know—only a little tired.'

'The truth is, you have sacrificed yourself for us all this time, and it is now beginning to tell upon you!' said Lilian. Turning towards Philip, she added: 'We have all needed her so much, and she has been so true a friend to us in our time of trouble, that she has forgotten herself, Mr Dallas.'

He murmured something to the effect that he could quite understand my doing that.

'But of course it will all be very different now,' said Lilian. 'It will be our turn; and we must try what we can do to pay back some of the debt we owe to her.—Now, don't look fierce, Mary; it's not the least use, for petted you will have to be.'

'Then I am afraid fierce I shall remain,' I replied, trying to speak lightly.

'That is more like yourself, dear. You are feeling better now, are you not?' asked Lilian.

'O yes, quite well; only a little tired from walking farther than I need have done,' was my reply.

'To think of my talking "*Mary*" to you all day without knowing you were more than friends!' said Lilian, looking up smilingly into Philip's face. 'I know now why you bore the waiting so patiently, and why we got on so well together.—I felt at home with Mr Dallas at once, Mary. I think we both felt that we two ought to be friends.—Did we not?'

He bowed assent.

'And you must please try to like me more than an ordinary friend, Mr Dallas, or I shall be jealous. Mary is my sister, you know, or at least you will know by-and-by; and we cannot be separated for very long; so you must be considerate.'

'Philip knows more about you than you do about him, Lilian,' I put in.

'I am glad he knows about me, of course, Mary; but it will take a little time to quite forgive your reticence about him.—Will it not, auntie?'

'Auntie' thought that forgiveness might just as well come soon as late, in her simple placid way. Then, to my great relief, a diversion was caused by tea being brought in. If Philip had not won the heart of his dear little hostess before, he would have won it now by his hearty appreciation of the good things set before him. I quite understood why, for the first time since Becky had been at the cottage, her mistress had some cause to complain of her awkwardness. Becky's whole attention was concentrated upon Philip; and she placed things

on the table in a somewhat hap-hazard fashion, gazing at him the while with curious speculative eyes.

Afterwards they commenced asking Philip questions about his voyage and so forth ; and the conversation became less personal. He gave us an amusing account of his passage, humorously describing the peculiarities of life on board ship. Then as night drew on, Mrs Tipper very earnestly pressed the hospitalities of the cottage upon him. Of course he would be her guest—a room was already prepared, and she knew that she need not apologise to him for its homeliness. She had, I found, arranged to give up her own room for his use, and share Lilian's. But he explained that he was going back to an hotel in town, having arranged to stay there for the present.

'I am afraid, I shall very frequently trespass upon your kindness nevertheless, Mrs Tipper. You will only get rid of me by giving up Mary, now.'

At which Lilian laughingly replied, *that* would be paying too dearly for getting rid of him. 'The better way would be to put up with you, for Mary's sake, and so secure you both.'

In truth, Lilian was a great deal more cheerful, I might say merry, than I had seen her for many a long day, in her unselfish rejoicing over my happiness. And the sweet, girlish, modest freedom—the freedom which is so diametrically opposite to fastness—of her manner with Philip, was so pleasant to witness ! It was the kind of playfulness which is so charming in a sister towards an elder brother, and which so well became her.

When at length Philip was obliged to take his departure, in order to catch the last up-train from Graybrook, he bade me, in the matter-of-course way which seems so delightful in those we love : 'Come out and set me on my way, Mary ; just as far as the stile, if you feel rested enough.'

Yes ; of course I felt rested enough. I went out with him into the starlit lanes, walking silently on by his side, happy in the belief that *his* thoughts also were too deep for words. How could words express *my* proud humility—the deep tender joy—the love half-afraid of its own strength which I felt ! Would he *ever* know the heights and depths of my love ? Would a lifetime be long enough to express it ? With it all, I was conscious of a shyness and awkwardness of manner, born of the indescribable feeling which accompanies, and gives a tinge of pathos to, great happiness in some minds. What was I, to be so blessed ? What other women find their ideal fall short of the reality, as I was doing ? Noble and true as I knew him to be, I had not hitherto, I think, sufficiently appreciated the geniality of Philip's temperament and his keen sense of humour. I do not know whether it was more noticeable in contrast with Robert Wentworth, who certainly impressed one with the idea that he was older than he was ; whilst Philip seemed younger than his age. His fine physique too. How very handsome he was, in the best way, and how grandly careless about it ! The most cynical observer could not have detected the slightest trace of conceit or self-consciousness in his tone or bearing. In fine, his was the rare combination of physical and mental power. Whilst he possessed the *gaieté de cœur* almost of a boy, an appeal to his intellect would call forth the cool vigorous reasoning of a well-informed thinker.

He had won his way to wealth by dint of intelligence, persistence, and temperate living, in a climate which gives some excuse for, if it does not foster, all kinds of excess, and returned strong in mind and body to reap the fruits of his labour. Moreover, he had not been tempted to continue accumulating wealth for its own sake, nor acquired the huxtering spirit which self-made men so frequently do acquire.

'I think I must not go any farther, Philip,' I said, as we reached the stile. 'You have only to cross the two fields, and turn to the right when you get into the road—that leads direct to the station.'

For a moment he made no reply, and something, I hardly knew what, brought vividly back to my mind the remembrance of another who had stood there on such a night as this, silent beneath the stars—a remembrance which struck upon my happiness as might a sudden sword-thrust upon an enraptured dreamer.

He gathered my hands into his own, and looking down into my face, said in a low earnest voice : 'There can be no necessity for delay between you and me, Mary. When will you let me take you away from here ?'

'Take me away from here ?' I repeated, rather startled by the suddenness of the proposal.

'I mean, when will you marry me, Mary ?'

'We will talk about that by-and-by,' I replied, overwhelmed with happiness again, yet afraid lest I might shew it more plainly than it is womanly to do if I said more.

'Why should there be any delay between you and me ? I—beg of you not to make any unnecessary delay, Mary. You ought to have been my wife long ago. I know you would prefer a quiet wedding, and—afterwards—wouldn't you like to travel a few months before settling down ? You used to have a fancy for seeing some of the old continental towns.'

I could only whisper that it would be very delightful—with him—lowering my head until my cheek rested upon his hand. Then to keep my reeling senses firm, I looked up into his face and made a little attempt at a jest about his not knowing me when first we met.

'Only for a second,' he replied. And even in that light I could see that his colour was heightened. He looked pained too ; and I certainly had not meant to pain him. Amongst my failings was not that of the desire to be always trying little wiles to test those I love, as we women are sometimes accused of doing. I had used the words solely in jest and to steady myself.

'Only for a second,' he repeated ; adding gently, 'and we will soon have you blooming again, Mary.'

Blooming again ! I caught in my breath with a little half-sob. Then making a strong effort, telling myself that I must and would behave better than a love-sick hysterical girl, I lightly replied : 'What if my blooming days are over, Philip ?'

He bent lower down, to get a better look into my face, as he said : 'Nonsense ! What makes you talk in that strain ? It is not fair to me.' Then he added more gravely : 'You have always told me that your friends here are real ones, Mary ; and they seem to be very much attached to you. It was very pleasant to hear them talk of you in your absence.'

'They are everything and more than I have described them to be, Philip. Mrs Tipper has been like a dear old mother to me; and Lilian—the best and truest thing I can say about Lilian is, that she is what she looks. No one could be mistaken about Lilian. Hers is the kind of loveliness which takes its expression from the mind.'

'Yes; it is just that. The fellow who could not appreciate her deserves to lose her.' I had given him an account of Lilian's troubles in my letters; indeed he was well acquainted with all that was connected with my life at Fairview. 'I only regret that I was not in England at the time. I suppose it is too late now for'—

'It is too late for any kind of intervention now; but if vengeance is in your thoughts, you may rest content. It will be, I think, quite punishment enough to be the husband of the girl he has married, with the remembrance of Lilian. He certainly loved Lilian.'

'Ah, that is something! When were they married?'

'About three weeks ago,' I told him. And then we got talking over the Farrar history, until the chiming of a distant clock reminded us that he had but twenty minutes in which to reach the railway station, in order to catch the last up-train.

'I shall do it!' he ejaculated; and with a parting word and hurried kiss he vaulted over the stile, and ran across the field, turning once on the way to wave his hand to me.

SUBMARINE CABLES.

LAYING.

BEFORE the days of steam-ships it would have been almost if not quite impracticable to lay ocean cables; for in order to do so with accuracy and success, it is necessary to be independent of wind and weather as far as possible. The course and speed of the ship must be under the control of the navigator, not at the mercy of the winds and currents, so that he may economise cable, and prevent undue strain upon it as the depth varies. Then too it is necessary that the ship should answer swiftly and surely to his will; that she should vary her speed, stop, or turn round, as promptly as he desires. The telegraph-ship is the helot of her cargo, and should be completely subservient to the work of laying the cable. A well-found steam-ship answers all requirements. Up till a few years ago no specially built telegraph-ship existed. The majority of cables have been laid from ordinary iron screw-steamers, fitted with tanks to contain the cable and paying-out gear. Recently, however, the steam-ships *Hooper* and *Faraday* (the first belonging to Messrs Hooper, the other to Messrs Siemens) were specially constructed as telegraph-ships for their respective owners. These vessels are very much on a par in size and carrying capacity. The *Faraday* is a ship of five thousand tons burden, and capable of carrying fifteen hundred miles of main or deep-sea cable. She is fitted with screws both fore and aft, so that her motion can be reversed without turning her in the water. She can thus, without changing her position, begin hauling in a cable which she had previously been paying out. Both of these ships are fitted with three large iron

water-tight tanks for containing the cable—one fore, one amidships, and one aft. The depth of these tanks varies from thirty to forty-five feet, and they are upwards of fifty feet in diameter. The *Hooper* has laid the Brazilian coast cables, and the *Faraday* the Direct United States Atlantic cable. Besides the tanks for holding the cable, the only other peculiarities of a cable-ship, as distinct from other steamers, are the heavy deck machinery for paying out the cable and for picking it up if necessary; the electrical testing-room; and the stock of large iron buoys she carries lashed to her gunwales for use in laying.

The cable-ship having been moored alongside the works where the cable is stored, shipment begins. The cable presents three aspects of increasing thickness, namely the shore-end, intermediate, and main; and thus graduated it is paid out of the tanks in the works into the tanks of the ship. When all is aboard, the tanks are filled with salt-water till the cable is soaked, and the ship puts to sea.

During her voyage to the place from which she is to start laying, electrical tests are taken daily of the cables on board, to see that they continue sound, and the machinery for laying is got ready. The souls on board may be divided into three classes. The *engineers*, or those in charge of the mechanical work of the laying, and their helps 'the cable-hands,' who do the rough work in the tanks and on deck, or in putting out buoys from the ship. The *electricians*, or those in charge of the electrical work of the laying, whose duty it is to see that the cable is all right electrically. The *navigators*, or those in charge of the sailing of the ship, including captain, officers, and seamen. The engineer-in-chief is generally the head of the entire expedition; he requires reports from the chief electrician, and instructs the captain where to put the ship.

Before laying a submarine cable between the proposed places it is extremely important to take soundings and otherwise survey the ocean, so as to determine the exact route the cable should take. A cable is too costly to be flung away anywhere on the sea-bottom, and the sea-bottom is sometimes of a very unfavourable character. It may be said that too little attention has hitherto been paid to this point in cable-laying. Expensive cables have been manufactured at home, with their relative lengths of shore-end, intermediate, and main determined by formula or usage, and then hid away in seas whose character had been largely taken for granted; the consequence being that weighty and very costly shore-end has been deposited in mud soft as butter where it would be out of harm's way; while unprotected main has been laid along the jagged surface of coral reefs. The depth and nature of the bottom, the strength and direction of currents, the temperature at the bottom, should all be ascertained beforehand by a special ship appointed to survey the proposed track of the cable. The best route for the cable is then laid down on the charts, as a guide to the navigator and engineers engaged in the laying.

Great improvements have recently been made in the method of taking deep-sea soundings. The ordinary plan is to carry the lead-line (a strong line or small rope of fine tanned Manila yarn) from the stern along the ship's side to the bows,

and there drop the lead into the sea. As it sinks the rope runs out off the drum on which it is coiled, and when the lead strikes bottom the running ceases. The introduction of fine steel pianoforte-wire for the rope, by Sir William Thomson, is a great improvement upon this clumsy method. The wire sinks quickly through the water, and is pulled in again with a very great saving of time and labour. But the most ingenious of all contrivances for finding the depth of the sea is Siemen's Bathometer, a very recent invention. The bathometer simply stands in the captain's cabin like a barometer, and indicates the depth of the sea over which the ship is passing, just as a barometer indicates the height of the atmosphere above. The action of this ingenious contrivance depends on the attraction of the earth on a column of mercury. This attraction is proportional to the earth's density, and the relative distance of its crust from the mercury column. Earth being denser than water, exercises a greater downward attraction on the mercury. If then there are say a hundred fathoms of water just under the mercury instead of a hundred fathoms of earth or rock, there will be less downward attraction on it. Taking advantage of this law, the mercury column is adjusted so as to indicate the power of the attraction and give the depth of water it corresponds to.

Arrived at the place from which the cable is to be laid, the first thing done is the laying of the shore-end from the ship at her anchorage to the cable-hut on the beach. The cable-hut is generally a small erection of galvanised iron or stone and lime to contain the end of the cable and a few instruments. Cables are never if possible landed in harbours, or where there is danger from anchors. A suitable retired cove is generally selected, not far distant from the town where the telegraph office is, and a short land-line connects the end of the cable to the office. In the cable-hut the land-line and cable meet and are connected together.

The distance from the ship to the cable-hut is accurately measured by the ship's boats or steam-launch, so as to fix the amount of shore-end necessary to reach the shore. This is then coiled in a flat barge or raft, and payed out by hand as the launch tugs the raft ashore. When the water becomes too shallow for the raft to float, the men jump into the water and drag the heavy end ashore. A trench has been cut in the beach up to the cable-hut, and into this the end is laid. In a few moments a test from the cable-hut to the ship announces that the shore-end is successfully fixed.

Everything is now ready for the ship to begin paying out. The anchor has been got up; the paying-out gear is all in working order; the men are all at their appointed places. The cable is being held fast at the ship's stern, and the running out by its own weight is prevented. But directly all are aboard again, the word is given, the screw revolves, the cable is let go at the stern, and the real work of paying out begins.

The cable passes from the tank to the stern of the ship, and from thence to the bottom of the sea. The weight of that part which hangs in the water between the ship and the bottom pulls it out of the ship as the latter moves along. If the ship were stationary, still the cable would run out, but then it would simply coil or kink itself up on

the bottom. The object is, however, to lay it evenly along the bottom, neither too tight nor too slack, so as at once to economise cable, and to allow of its being easily hooked and hauled up again from the bottom without breaking from over-tightness. The speed of the ship has therefore to be adjusted to the rate at which the cable runs out. It should be a little under the rate of the paying out, so that there is a slight excess of cable for the distance travelled over. Now the rate at which the cable runs out from the ship is greater, the greater the depth; therefore the speed of the ship must be varied as the depth changes. The rate at which the cable runs out, however, is not entirely dependent on the depth. It can be controlled on board by mechanism. The cable can be held back against the force pulling it overboard. But there is a limit to the extent to which it may be held back, and the tension on it must not be so great as to overstrain it. It is necessary, therefore, to know what tension there is on the cable at any time. To achieve this, two apparatus are used: the friction brake (for holding the cable back) and the dynamometer (for indicating its tension).

The cable is made to run cleanly out of the tank by being allowed to escape through a funnel-shaped iron framework called a 'crinoline.' This prevents it from lashing about or flying off as the ship rolls. It then passes over pulleys to the paying-out drum, round which it is passed several times. The paying-out drum is controlled by an Appold's friction brake, which is simply a belt or strap of iron with blocks of wood studded to it claspings the periphery of the drum and restraining its revolution by the friction of the wooden blocks. The tighter the belt is made to clasp the drum, the greater the friction on the drum, and the greater the force required to make it revolve. After passing several times round the drum, so as to get a good hold of it, the cable passes through the dynamometer to the sheave or grooved pulley projecting from the stern, and from thence it passes to the water. The dynamometer is simply a 'jockey pulley' riding on the cable; that is to say the cable is made to support a pulley of a certain weight; and according as the tension on the cable, due to the weight of cable in the water, is greater or less, so will the weight of this jockey pulley supported by the cable cause the cable to bend less or more. Although this jockey pulley is the essential part of the dynamometer, there are three pulleys altogether, two fixed pulleys at the same level, with the riding pulley between. The cable passes over both the fixed pulleys and under the riding pulley. The weight of the latter bends the cable into a V shape; and as explained above, the depth of this V is greater as the tension on the cable is less. In short the tension of the cable can be told from the depth of the V, which is therefore graduated into a scale of tensions.

By regulating the friction on the brake the cable can be held back, under restrictions of tension indicated by the dynamometer, and the speed of the ship adjusted to give the proper percentage of slack. Sixteen per cent. for a depth of two thousand fathoms is a usual allowance. The slack should vary with the depth, because of the possibility of having to hook the cable and raise it up from the bottom to the surface to repair it. The revolutions of the drum, the tension on the cable,

the number of turns of the ship's screw, are constantly observed night and day as the laying goes on.

In the electrical testing-room the same watchful activity prevails. A continuous test is kept applied to the cable, to see that its insulating power keeps steady; in other words, to detect any 'fault' that may occur in the cable which is being laid. This is done by charging the cable throughout, from the end on board the ship to the end left behind in the cable-hut, with a current of electricity, and observing on a galvanometer (an instrument described in a recent paper) the amount of electricity which leaks through the gutta-percha from the copper wire inside to the sea-water outside. To shew that the copper wire too keeps continuous from ship to shore, a pulse of electricity is sent along the cable at stated intervals, usually every five minutes. This is either sent from the ship to the cable-hut, or from the cable-hut to the ship by the electricians left on duty there. The resistance too of the copper conductor is regularly taken at times, to see whether the conductor remains intact; for the pulse test only shews that it is continuous, and would not shew, for instance, that it had been half broken through.

The navigators of the ship are meanwhile as busy as the rest on board. It is important to keep the ship as nearly as possible up to the prescribed course marked on the chart, and in any case to determine accurately her place whatever it may be, so that the precise position of the cable on the bottom may be known, in order to facilitate future repairs, if necessary. Observations of the sun and other heavenly bodies are therefore made as often as feasible, and the navigation of the ship very carefully attended to.

If a fault should be reported from the testing-room, the engines are at once reversed and the ship stopped. The length of cable being payed out is cut in two within the ship, and that section still on board is tested first. If the fault is found to be there, a new length of cable is jointed on to the section in the sea, and the laying is again proceeded with. If, however, the fault is in the section already laid, special tests must be applied to locate the fault. If it should be proved to be but a few miles from the ship, she is 'put about;' the end of the section is taken to the bows, where the picking-up gear is situated, and the cable is hauled in slowly from the sea by the help of a steam-winch, the ship going slowly back the way she has come as the cable comes on board. This goes on until the fault is reached and cut out. If the fault should be proved to be twenty or more miles away, the end of the cable is buoyed, and the ship proceeds backward to the locality of the fault. Here she grapples for the cable, hooks it, and draws it up to the surface, where it is cut and the two parts tested separately. The flaw is then cut out of the faulty part and the cable made good. She then returns to her buoy, picks up the end there, joints on the cable on board to be paid out, and continues her voyage.

Arrived at her destination, the shore-end there is landed to its cable-hut. A test taken from there and signals exchanged between the two cable-huts proclaim the completion of her work. It only remains to test the cable daily for a specified period, generally thirty days; and if during

this trial time it remains good and sound, it passes into the hands of the Company for whose use it has been laid, and is then employed for regular traffic and public benefit. In a concluding article we will describe the *working* of submarine cables.

THE ROMANCE OF A LODGING.

IN TWO CHAPTERS.—CHAPTER II.

'WELL, Fred, what will you say to all my sermons on extravagance, when I tell you that I have actually taken the landlady's first-floor rooms for a month; and that without any view to your advantage, which has hitherto actuated my movements? You will say it is only a preliminary step to my employing the artist—who by the way is not an artist after all—to take my portrait!'

Thus did Mrs Arlington announce her plans next morning at breakfast to Fred, who offered no remonstrance. It was enough for him that she chose to do it; he was too well satisfied and accustomed to her guidance and good sense not to fall in readily with everything she did, as the best possible that could be done; and so he assented without a remark.

'You don't scold me, Fred! I expected your reproaches; but they will come later; you are too engrossed at the present moment with the prospect of the examination before you to-day; but I have no fear for you; so have none for yourself.'

'What will you do while I am away?'

'Stay where I am; study the pictures; read the backs of all the books through the glass doors of the bookcase; and think what a churl the owner is to have locked them up. And this amusement over, I shall go in search of a piano; we cannot live for a whole month without one; can we? So I shall order it to be sent on Wednesday morning to our new quarters.'

'Suppose the "gentleman" unlocks his, and sets up an opposition tune; the jumble of melodies will be the reverse of harmonious.'

'Possibly; but then, you phlegmatic youngster, you wouldn't keep me without such a resource, for fear of an occasional discord! Let us hope the gentleman in question will give place to the ladies, and be amiable enough to listen without creating a discord; or he may decamp altogether, if he does not approve of our performances.'

'But tell me what has put it into your head to stay a whole month in London? I thought you said we had only funds for a week.'

'Well, my dear boy, it is just this: I have been thinking that we may as well wait and hear the issue of the examination; as in the event of your being among the successful candidates, of which I have very little doubt, you would be ready to go to Sandhurst without having to incur the double expense of the journey home and back again. Besides, I should like to see the last of you before I sink into my future oblivion, with no further call in the world upon my time and attention beyond writing to you.'

'What nonsense you can talk, mother, when you once begin! I suppose you expect me to believe you are one of the sort that is allowed to go into oblivion. I bet you ten to one some fellow will be wanting to marry you when I am at college!'

'Hush, Fred!' she said, with a solemnity of manner she well knew how to assume, that

effectually quenched any conversation the subject of which she did not approve. 'It is time you started.'

'Forgive me; and good-bye,' he said, with a smile, as he prepared to go.

Wishing him 'God-speed,' she saw him depart, and then rung for the landlady.

'There is no difficulty, I hope, about the rooms?' she asked.

'None whatever, ma'am. I've told the lady; and they leave to-night.'

'Thank you. I wished to know positively before I ordered a piano. I suppose there is no objection to my having one, since there is another in the house?'

'None whatever, ma'am. Leastways Mr Meredith is mostly playing and singing when he isn't reading or painting, or at his meals; so that I am well accustomed, to the sound by this time. I like it when he plays lively music. But dear me, ma'am! there are times when his spirits are low, or so I take it to be, and then he plays such dreary doleful tunes, it is for all the world as bad as the Old Hundred on them barrel-organs.'

'He is not married, then?'

'O my! no; not he; nor never likely to be,' she exclaimed, repudiating the idea of losing her lucrative lodger under such unfortunate circumstances. 'His man James says as how he once painted that there lovely faced young creature to remind him that women were one and all as false as— I wouldn't like to offend your ears, ma'am, by naming the unholy gentleman as he likens them to; which I took to be no great compliment to myself, seeing I am a woman as was never false to none, which is saying a good deal, seeing how selfish and tiresome men are, as a rule, that it needs us women to be born saints and angels to put up with them.'

'I am afraid I can't quite agree with you there,' said Mrs Arlington, smiling. 'I rather think we give as much trouble as we get, and a little more sometimes.'

Wednesday morning saw her installed in the rooms above, which she busied herself in arranging tastefully, with a view to making their lengthened sojourn comfortable. Towards evening the piano came, and she was just about to try it, when an unusual bustle below-stairs announced the arrival of the gentleman, Mr Meredith. He was evidently a person of consideration in the eyes of the household; such hurrying to and fro and up and down to have everything as he would like, had not before been experienced.

'Glad to see you home, sir,' said Mrs Griffiths, courtesying, and beaming with pleasure.

'Thank you. Have the rooms been occupied?'

'Yes, sir.'

'I should say you ought rather to be sorry I have come, then.'

'Not at all, sir. I've been able to accommodate the lady up-stairs; and right glad I was that she came when she did, for she has got no troublesome hussy of a maid to come bothering about my kitchen.'

'The same old story, Mrs Griffiths!' he remarked, as he smiled pleasantly at her inability to hide her ruling mania; 'and now please let me have dinner as soon as you can, as I have an engagement this evening.'

He walked round the room, placing his desk and other articles he had brought with him in order; examined his pictures, to see that they had not undergone ruthless treatment at the hands of deputy-lodgers during his absence. After looking at them all he paused opposite the portrait of the young girl, and exclaimed mentally: 'Yes, there you are still, heartless mocker! just as you looked when you defied me and flung back my love in scorn. And yet—and yet—perhaps had I but been a little gentler, I might have softened you!' he cried in remorseful thought as he turned away; and the look of genuine regret he wore shewed how deep had been the wound that had the power still to call up a thrill of pain. 'Yes, I tried to break her proud spirit and make it subservient to mine, and I broke my heart instead! She was but young; I ought to have known better; but I was hard and determined, and could brook no opposition to my will. I had studied life, and established my views on most points, until I grew intolerant—a disease natural to culture as well as creed—and could ill bear to have my opinion questioned, especially by those who aspired to my friendship or affection: it interfered with my visions of harmony. Harmony! It was but a monotonous dreary unison I was cultivating, to foster my intense self-love. Bitter delusion! And from her, above all others, I demanded a slavish bending of her will to mine. I was jealous of her possessing an individuality or free right of being or thought apart from me. I was not content with her affection; I wanted her blind worship. No wonder her proud spirit revolted at such a prospect of bondage, and flung me and my love far from me. She was wise and right, and I was too headstrong to humble myself to sue for her forgiveness, or seek to win her by a nobler course. My heart was a flint, which it needed *her* loss to soften, for I have never seen another like my darling! Yes, my poor girl, I was unjust and cruel, and Providence was kind to you in rousing you to resist!'

In such a strain did his thoughts run, as he sat waiting for dinner, of which he partook in no very elated mood. When the spirit wanders in the sad lone land of irreparable regret, and surveys with the light of experience how different all *might* have been, had our hearts and wills been differently tuned to action, it is then our footsteps linger, painfully borne down by a weight, well nigh fatal to that courage which bids us bury our dead out of sight, and wander no more amid the graves of the past, but live afresh in the light of a new and better day, with high hope and stern resolve.

Something of this he had done, but not all, for the torment of self-reproach was at times powerful to waste his endeavours in fruitless action or torpid reverie. He was about to sink into the latter at the close of dinner, as, left alone with his coffee and cigar, he sat meditating on the past which he had invoked, when he was startled by the sound of music and the strains of a melody which seemed to float to him across the distant years, and reawaken his heart's sweetest and bitterest memories. Ah! how well he remembered it. It was one he had written and composed for *her* of whom he had been thinking; and when she sang it to him, he could scarce restrain his tears; but there came a little 'rift within the

lute' one day, that soon 'made all the music mute.' Some slight alteration that she had asked for, jarred upon his sense of its perfection—and his own—and he refused half haughtily, which she resented; words succeeded words, until that was said which could never be forgiven or undone; and then she asked to have her freedom back, and he gave it: yes, he gave it! and had never seen or heard of her after, until now—he hears the echo of the melody; but the voice—'Can that voice be hers?' he cries passionately. Starting up in his chair he listens, with every nerve vibrating to the sound, until it is finished. 'My own song!' he exclaims aloud; and then he rings the bell nervously and summons the landlady. 'Who is your new lodger?' he inquires with assumed calmness.

'Mrs Arlington, sir.'

'Arlington? Arlington?' he mutters. 'Never heard of her. What is she like?'

'A tall sweet-looking lady, sir: I was that taken with I hadn't it in my heart to turn her from the door the night she came here; so I gave her your rooms for a couple of days, for her son and herself.'

'Son! did you say? How old?'

'About sixteen, I should reckon: he has come up for his examinations.'

'No; it is not she,' he thought sadly; 'she could never have had a son so old. But it may be some friend of hers. How else came she by that song, I must find out.—Thank you, Mrs (Griffiths,' he said aloud; 'you did quite right to let the rooms; and since she is such a favourite with you, you are welcome to the newspapers for her. Perhaps you had better take them to her every day with my compliments.'

'Thank you, sir; I am sure you are most kind; and I'll tell her what you say.'

'I never will believe, ma'am, half as these good gentlemen say who profess so loud against women-kind. Here Mr Meredith down-stairs, as James says swears against a petticoat even if he sees it hanging in a shop-window, which is most unfeeling-like, to say the least of it—here's he been a begging I'll bring you the newspapers every day, with his compliments!'

'Indeed! That is very thoughtful of him,' said Mrs Arlington, smiling at her landlady's enthusiastic sense of victory. 'Pray give him my compliments, and say how very much obliged I feel. What did you tell me his name was?'

'Meredith, ma'am.'

'Of what family, do you know?'

'That's more than I can say, ma'am. Families, to my mind, is like flowers—a great lot all alike, but divided into so many branches, it were always a puzzle I stopped at. I call a pink a pink, and a carnation a carnation; though the gardener where I lived in service could tell you they were different branches of one family, with a long Latin name, as I never could see not the least bit of good to remember. So I just follow the same plan with families, call them by the names as they hold at birth and baptism; and I only know my gentleman by the label on his box: "Mr Firman Meredith." But if you were pleased to wish to know, I'll ask his man James.'

'Not on any account,' said Mrs Arlington; 'I am not in the least curious; I merely asked for

asking's sake. Give my compliments and thanks, nothing more.'

The newspapers paid their regular daily visit for a week, during which time Mrs Arlington never once touched the piano when she knew that Mr Meredith was at home; although he had purposely remained indoors, hoping he might again hear the song which so roused his memory on the evening of his arrival; but after seven nights of waiting and disappointment, and ineffectual efforts to catch a glimpse of the lady, who did not go out once during that time, he grew so restless and impatient, that in desperation he summoned the landlady once more to his assistance.

'Well, Mrs (Griffiths, is your lodger gone or dead? She is a very silent person.'

'O dear, no, sir,' said the landlady, smiling. 'She took the rooms for a month, certain; but she's been suffering from a cold; and the young gentleman has been away most days at his examinations; but he's that quiet you'd never know he was in the house but for his boots.'

'Had she any visitors the first evening I arrived?'

'None, sir. She hasn't told any of her friends, I imagine, that she is here; as it is not to be supposed as how such a well-to-do lady as she seems is without a whole score of friends, as would keep me busy at the door if they only knew where she was.'

'Do you think she objects to visitors then?'

'How can I say, sir? Were you pleased to wish to call?' she inquired somewhat sily. 'I'll speak to the lady, and find out if it would be agreeable, if you like, sir?'

'Please yourself about that,' he returned with feigned indifference. 'If I can be of any service to her or her son, beyond the newspapers, I shall be happy to call.'

'You are very good, sir, I am sure, and I'll tell her. She was most grateful for the newspapers.'

With a glow of triumph on her face, Mrs Griffiths next morning appeared before Mrs Arlington. It was now her settled conviction that her theories concerning the unreality of the enmity of certain men for women was as 'true as gospel,' to use her own phrase; and as there is nothing dearer to human nature, from the deepest philosopher even to a speculating landlady, than to feel that they have hit upon an infallible vein of truth, her rejoicing was very natural.

She had been planning all the way up the stairs how she might best introduce such a delicate topic with due acceptance, for Mrs Arlington was a lady, she felt, who was not to be taken liberties with; but impulse overruled discretion, and she burst out plumply with the question: 'Would you please to like the gentleman to call? I think, ma'am, for all he feigns to hate us, he's about dying to come up.'

Mrs Arlington fairly laughed aloud at the partnership in the compliment assumed by her good-natured landlady. 'What do you say, Fred?' she inquired, appealing to her son, as though declining the matter for herself.

'By all means have him up. We should be Goths to accept his papers, and say "No, thank you," to himself.'

'You can tell him then, Mrs Griffiths, that we shall be happy to see him this afternoon.'

'You will, you mean,' said Fred. 'You know I promised Cathcart to go out with him, at yesterday's exam., and spend the afternoon upon the Serpentine, after our week's fag.'

'Very well; then I will receive him. *Tant mieux*. I can judge if he is likely to prove a desirable friend for you, Fred.'

With the afternoon came Mr Meredith's servant with his master's card, requesting to know if Mrs Arlington could receive him.

Having granted the permission, her face betrayed unwonted agitation, which it required all her nerve to control before the door opened and he entered. He had advanced half-way up the room to where she stood waiting to receive him, when their eyes met, and flashed one mutual heart-stirring glance of recognition, which she was the bravest to bear, as he started exclaiming: 'Gertrude Bancroft!'

'Firman Meredith!' she cried, but with calmness, for she at least was in a measure the more prepared of the two. They shook hands; nay more; they met as we meet the loved and mourned, after years of parting; and then she whispered, as she held his hand: 'I am Gertrude, but not the proud, soulless, imperious girl whose portrait you have so faithfully preserved. I am now Gertrude Arlington, whose life, I hope, has not been altogether spent in vain. And yet mine was not the whole wrong; was it Firman?'

'No; my poor girl; God knows it was not. To myself alone I take all blame.'

'Nay; I cannot allow that.'

'But it is the truth all the same,' he sighed. 'Had you yielded to my will, I might have slain you with my cruel stony heart; when you resisted, as you must have done, matters might have ended I know not how. Indeed, I might have destroyed you, as surely as he who takes weapon of steel or drops of poison to rid himself of her of whom he has wearied! A merciful God saved you from such a fate, and me from the worse one of causing it.'

'You judge yourself too harshly, Firman; I have no such thought about you.'

'Not so, Gertrude, believe me. There are many gone to their rest who, if they could return, would tell you "he speaks truly:" poor souls, who have gone to their graves thanking God for their release from a life which left them nothing to hope for but death!'

'Then, Firman, there is nothing to regret between us; for across the gulf of precious years, wherein we have each learned so much, we can clasp hands faithfully as truest friends. May I tell you, it was for this I remained; for I recognised the sting I had left in your heart when I saw the pencil sketch of the portrait you had made; and I thought that if we could meet once more, and leave happier impressions than those remaining, it would be wise and right to thus overcome past evil with future good. And now once more you are my friend; are you not?'

'And nothing more! Ah, Gertrude, have you no dearer name to promise me, after all these years of sorrow and loneliness without you?' he pleaded.

'Yes; my whole life shall be yours, if you think I can make you happy,' she murmured; 'but not unless—have no misgivings, Firman.'

'Happy! That is a poor word to express the intensity of my gratitude for this meeting, and

your promise that we shall never part again. Oh! I too have a past to repair, of which I hope your future life may be the witness! You *are* my Gertrude; and yet, now I look well at you, you are not mine, for your face has altered, and wears a softened look, different from the old Gertrude.'

'Let us forget her altogether, and paint me afresh as I am—a woman, who for years has prayed for nought else but what is born of a humble, tender, loving heart. If you find I possess it, then, Firman, our long parting has not been in vain. But now we have much to tell each other of our past lives.'

'I shall feel more interested in planning our future,' he remarked, smiling.

'Ah, well, whatever we may arrange about that, I shall consider it a point of honour not to rob Mrs Griffiths of her pet lodger! It would be base of me to requite the good Samaritan by running off with the ass!' she added merrily; 'so, we must keep her rooms for the present.'

'I'll take the whole house, if that is all, and then you will be obliged to stay altogether; for where I am, there you must be also.'

'And I leave it to you to tell Fred, my boy,' she added with a pretty blush, 'for I feel a guilty cheat towards him; he has looked upon me as his mother, I may say, for so many years, I shall seem like a deserter.'

'Say rather you *have* been one, and are now returning to your colours.'

'Strange to say, Fred was struck with the portrait, but found no resemblance to the original.'

'Because you are no longer the same woman; the original has gone.'

And thus were happily reunited for life two who, though severed for a while, had been all along intended for each other—this was the Romance of the lodging.

ROUGHING IT.

THE explorer traversing a hitherto unknown country, the soldier engaged in a campaign, the hunter, the trader, and the settler in the borderlands of civilisation, have every day and sometimes every hour to supply by their own ingenuity needs which for us are satisfied by the simple expedient of sending to a well-stocked shop for what we require, or calling in a skilled workman to do a job for us. Accustomed as we have been all our lives to procuring our bread and meat from the baker and butcher, sleeping every night in comfortable bedrooms, trusting for protection to 'Police-man X' and his brethren of the blue coat and helmet, and making our journey by rail at fifty miles an hour—we can hardly realise the position of a man who is thrown on his own resources for food and shelter in a wild country, where perhaps his road lies over scorched plains or through dense forests. Yet if he only knows how to set about it, such a man can live and travel or do his work in comparative safety and comfort. Even on his own ground the uncivilised is inferior to the civilised man, for the latter has learned or can learn from the savage all that is most useful in a wild country, and can add this local knowledge to the resources which civilisation has placed at his command. His

natural physical powers are generally superior to those of an uncultured people, and he can supplement them by aids derived from art. What is the piercing sight of an Indian or an Arab scout to the power of a good field-glass or telescope? And in the chase or the fight the assegai or the flint-lock musket stand but a poor chance against the rifle. Moreover the savage knows only a few shifts or 'dodges' peculiar to his own people; but the explorer has at his command at once the arts of civilisation and those of hundreds of uncivilised tribes. He learns from the Eskimo to traverse the snow on snow-shoes, or make long journeys with the dog-sledge; he takes the canoe of the Indian, and the Malayan outrigger; he can build a half-buried hut like a Tartar, or a palm-leaf cottage like a negro; he learns from the Guacho to stop a wild-horse with the lasso; and in the pursuit of game, the traditional lore of the trappers and hunters of every land is at his service. If he is strong, active, and hardy, and can use a few tools, he can learn in this way a hundred 'shifts and expedients,' either from oral instruction, or from books such as that which lies before us: *Shifts and Expedients of Camp Life, Travel, and Exploration*. By W. B. Lord, R.A., and T. Baines, F.R.G.S. Field Office. (30s.)

We have seen other works of the same kind, but none so complete as this. To the explorer, the soldier, the settler, and the missionary, it will be invaluable; and even stay-at-home people who lead an active life in the country, will gather many valuable hints from it. To all it will be of interest, on account of its numberless anecdotes of successful struggle with difficulties of every kind, sketches of the arts and customs of uncivilised man, and notes on the topography of many lands and the natural history of their winged and four-footed inhabitants. Here we are told how to set about building a boat of wood or skin; how to make a birch-bark canoe; how to repair a broken axle or wagon-wheel; how to cross a bridgeless river; how to build a hut or pitch a tent; to picket horses and secure camels; to trap wild beasts or snare birds; to find a dinner where there are no shops, and to cook it without a kitchen. These are a few of the many subjects treated by our authors, who are themselves veteran travellers and explorers, and have learned in the field much of the knowledge which they here communicate to others.

It would seem that one of the chief difficulties in organising an exploring expedition is to decide upon the stores and provisions to be carried. If there is not enough of these, the party may be crippled far from its base of operations; if there is too much, its movements will be seriously impeded by the necessity of transport. Much depends upon the nature of the country. One of the Australian expeditions which had to traverse districts where food of all kinds was scarce, had to carry an enormous amount of stores, the first item in the list being seventeen thousand pounds of flour; but

then the party consisted of twenty-one men. Generally an explorer is in the best position who can start off with only one or two white followers, the rest of his party being hired natives, well used to the ways of the country; and we believe the most successful explorers have been those who, as far as white men are concerned, have worked alone or almost alone. Livingstone's success is a good proof of this. Mr Lord suggests that in countries where riding is practicable, explorers should make up their minds to eat horse-flesh occasionally, and start with a good train of pack-horses, each horse being shot and eaten as soon as its burden is disposed of. He does not appear to have ever tried the plan himself; and we fear that at the end of a long march the flesh of a hard-worked pack-horse would be a very poor substitute for roast-beef. It is a pity that oxen cannot be used as pack-animals. They are turned to a stranger purpose in South Africa, where the Hottentots and Kaffirs saddle and ride them; and one of the authors of this book of travel tells us that he has more than once had a very comfortable ride on one of these horned steeds.

The Tartars use dogs to carry packs; in the far north they do the chief work in pulling the sledges, though the Laplanders chiefly use the reindeer for this purpose. The Eskimo sledge-dogs are fine strong animals, nearly allied to the wolf; and Messrs Lord and Baines give some amusing hints about their management. The sledge-driver must never leave his sledge without securing it to a spear driven into the snow, or the dogs will perhaps start off of their own accord and distance all pursuit. They are very quarrelsome; but generally in every team there is one master-dog, with a very determined will and strong sharp teeth; and when he sees the others fighting, he will dash in amongst them, and vigorously assist his master in restoring order. When rough ice is to be traversed, the dogs' paws are protected by little bags or moccasins of hide. They are not fed till the day's work is over; and great care has to be taken that each gets his proper share, for 'some are so desperately artful and cunning that they do all in their power to delude their master into a belief that instead of having had their full allowance, it is yet to come.' The Lapland sled or *kerres* is different from the low flat Eskimo dog-sledge. It is shaped something like a big shoe, and is drawn by the reindeer, which is used in the same way in Siberia, and also for riding and carrying packs. In many countries summer sleds are used. One of the easiest to make is formed of a forked branch, with pieces of wood nailed across the fork, the horse or mule being harnessed to the pointed end. This is often used by the settler for dragging loads of all kinds over level ground.

These forked branches and sticks can be turned to an endless number of uses. Grindstones are mounted between them; they form yokes for hanging weights over the shoulders; hooks for suspending small objects in the hut or tent; racks for arms and harness. In many countries the native plough is formed of two forked branches tied together and dragged by one man, while another holds it down, and thus scratches a furrow in the ground. The frontier settler has sometimes to be content with a similar contrivance, made on

a larger scale, of bigger branches, and drawn by a couple of his oxen.

Some of the architectural 'shifts' are very interesting, for there is a wide field for ingenuity in the construction of hut and boat. In the tropics, huts are very easily constructed by building up a framework of poles, branches, or bamboos, the sticks being not nailed but lashed together where they cross; this rough outline of walls and roof is then filled in with mats, bundles of rushes, or the broad leaves of the fan-palm. Another method is to build the hut of slabs ingeniously formed out of a very unpromising material—long reeds. A few sticks are cut and laid parallel to each other on the ground; then across these a thick bed of reeds is carefully arranged; another stick is laid on this bed, exactly over each of the sticks below; the projecting ends of each pair of rods are then tied together; and the solid mass of reeds thus secured can be raised on its lower edge and supported by props or by other slabs meeting it at an angle, much as children build houses of cards. In this way very serviceable stables and outhouses are often made in India. Having erected his light hut or pitched his tent, the traveller, if he is making a prolonged halt, proceeds to furnish it. Planks and boxes supply seats; and if there is a pole in the centre, a serviceable table can be made by fixing a wagon-wheel on it about two and a half feet from the ground, the pole passing through the centre of the wheel, and the spokes being covered with a few small boards. A comfortable bed is easily improvised. Livingstone had a new one made every night under his own supervision. This was his plan. First, he had two straight poles cut, two or three inches in diameter, which were laid parallel to each other at a distance of two feet apart; across these poles were placed short sticks, saplings three feet long; and over these was laid a thick pile of long grass; then came the usual waterproof ground sheet and the blankets. 'Thus,' writes Stanley, 'was improvised a bed fit for a king.' The wagon used by the colonists at the Cape is very like a long hut on wheels, and forms a very comfortable sleeping-place; while a large tent can be made by halting the wagon, driving in a few poles near it, and stretching the tent canvas from these to the wagon-roof. It has been proposed too that this roof should be an inverted boat of waterproof canvas, which could be removed at pleasure and used in crossing rivers. The wagon is so large that this seems to be quite a practicable idea.

Every explorer and traveller must carry some kind of a boat or canoe with him. If he is without one, the natives will often make most extortionate demands for the hire of their own to him; but if he has one, no matter how small, he can bargain on much more equal terms. But even if no boats can be procured, the mere crossing of a river can always be effected by means of rafts. These can be made of almost anything; casks, boxes, planks, reeds, bamboos, all can be pressed into the service; but we are told, it must be borne in mind 'that the cargo a raft can carry above water is always small, and not at all like the mountain of treasure invariably represented on that of Robinson Crusoe.' These rafts are often constructed of very strange materials. On the Nile they are made of jars, which are thus brought down the river to be sold at Cairo. On many of the African rivers they are

made of bundles of sedge-grass; and lying down on these, the hippopotamus hunters approach the huge beast; the raft looking so like a natural accumulation that he does not attempt to get out of the way till it is too late. On such a raft, made on a larger scale, the Swedish naturalist Lindholm and his assistant successfully descended one of the rivers that feed Lake Ngami. The voyage was a strange one. The raft was built in a quiet nook by throwing hundreds of bundles of sedge across each other, without any other fastening than their natural cohesion and entanglement. On this huge floating mass a hut was built, and the two adventurers then poled it out into the stream, and it went down the current at the rate of about forty or fifty miles a day. Occasionally it took the ground at the bottom, but when a little of the grass tore off, it floated clear again. As the lower layers became sodden and pressed together, fresh grass had to be cut every day and laid on top, till at last there was six feet of the raft under water. Occasionally overhanging branches tore off some of the grass, and once a large projecting trunk lay so close to the water that it 'swept the decks fore and aft.' The hut was destroyed, and with much of its contents was carried away into the river; but the travellers saved themselves by climbing over the bough, and then repaired the damage and resumed their voyage. Sir Samuel Baker constructed a much more singular raft to cross the Atbara River in Equatorial Africa. A bedstead supported by eight inflated hides formed the basis of the structure; and on this was secured a large sponging bath three feet eight inches in diameter, which formed a dry receptacle for the ammunition and other baggage.

One of the most remarkable features of uncivilised life is the power savages shew of tracking men and beasts over immense distances. Many travellers have spoken of this as something almost miraculous, yet it is only the result of careful observation of certain well-known signs; and we have here before us a collection of very common-sense hints on the subject. In countries like ours every trace of foot-print or wheel-track on roads and paths is soon obliterated or hopelessly confused; but it is otherwise in the wilderness, where neither man nor beast can conceal his track. In Kaffirland, when cattle are stolen, if their foot-prints are traced to a village, the headman is held responsible for them, unless he can shew the same track going out. A wagon-track in a new country is practically indelible. 'More especially,' say our authors, 'is this the case if a fire sweeps over the plain immediately after, or if the wagon passes during or after a prairie fire. We have known a fellow-traveller recognise in this manner the tracks his wagon had made *seven years before*, the lines of charred stumps crushed short down remaining to indicate the passage of the wheels, though all other impressions had been obliterated by the rank annual growth of grass fully twelve feet high.' Sometimes the original soil being disturbed, a new vegetation will spring up along the wagon-track, and thus mark out the road for miles. Even on hard rock a man's bare foot will leave the dust caked together by perspiration, so that a practised eye will see it; and even if there is no track, a stone will be disturbed here and there, the side of the pebble which has long lain next the ground being turned up. If it is still damp, the man or beast

that turned it has passed very recently. If a shower of rain has fallen, the track will tell whether it was made before, during, or after the shower; similar indications can be obtained from the dew; and another indication of the time that has elapsed since a man passed by is furnished by the state of the crushed grass, which will be more or less withered as the time is longer or shorter. Other indications are drawn from the direction in which the grass lies; this tells how the wind was blowing at the time the grass was crushed; and by noting previous changes of the wind, one learns the time at which each part of the track was made. Much too can be learned from the form of the foot-prints. Savages generally turn their toes in, in walking; white men turn theirs out. A moccasin print with the toes turned out would indicate that a white man in Indian walking-gear had gone by; and almost every foot has a print of its own, which enables an experienced tracker to follow a single track amongst a dozen others. Similarly the character of the print will tell whether the man who made it walked freely or was led by others; whether he was in a hurry or travelling slowly; whether he carried a burden; and if he were sober or tipsy. A horse-track is equally well marked. It tells when the horse galloped, where he walked, when he stopped to feed or drink; and a scattering of sand and gravel will tell when he was startled by any strange sight. In all this two things are needed—sharp sight and careful training. The elephant often makes a very curious track as he walks; if he suspects danger, he scents the ground with the tip of his trunk, and this makes a well-marked serpentine line in the dust. Elephants have changed their tactics since rifle-pits were introduced. Formerly, when their chief danger was a pitfall, the leader of the herd felt the ground inch by inch; and if he detected the covering of a trap, tore it off and left it open. Now they rely much more on scent, and in this way, often from a great distance, detect the hunter lurking near their drinking-places. If so, they will sometimes travel fifty or a hundred miles to another stream or pool.—Such is a specimen of this generally amusing book.

FANCHETTE, THE GOAT OF BOULAINVILLIERS.

AN EPISODE OF THE SIEGE OF PARIS.

WHILE the German army inclosed in its iron grasp the most brilliant and pleasure-loving city of Europe, transforming in a moment its epicurean population into a people of heroes, the environs once so gay and so beautiful had experienced a change almost as great. Most of the detached villas were deserted, or occupied by the enemy, and the villages whose regular inhabitants had either taken refuge in Paris or fled to a distance, were repopulated by a singular assemblage of individuals belonging to all classes of society, and bound together only by the tie of a common nationality, and the necessity of finding a shelter and providing for their daily wants.

The hamlet of Boulainvilliers, which had been thus abandoned, had received an entirely new colony, and its beautiful avenue carpeted with turf of the most lovely green, had all the appearance of a camp. As long as the season would permit,

cooking was carried on in the open air, and groups were constantly to be seen surrounding the fires and exchanging accounts of their mutual misfortunes.

A painter of Fleurs, bearing the English or rather Scotch name of MacHenry, was among these refugees. He had brought with him from Colombes, where he had before resided, a remarkably beautiful white goat called Fanchette. This creature, to which her master was much attached, figures in the most of his pictures. Light and graceful as a gazelle, she is represented sometimes cropping delicately the green branches of the hedgerows and bushes, sometimes entangled in a maze of brier-roses, their pink blossoms and green leaves falling around her in elegant garlands, and contrasting well with the snowy whiteness of her skin.

Fanchette was a universal favourite; and few there were at Boulainvilliers who would not have deprived themselves of a morsel of the bread sometimes so hard to procure, that they might reserve a mouthful for the goat, which, however, the saucy thing would only accept from her particular friends.

The grace and rare intelligence of the animal frequently relieved the miseries of the siege. All were surprised at the wonderful education her master had succeeded in giving her. He had even taught her something of his art; and it was really extraordinary to see the sensible creature busily employed in arranging pebbles on the ground, so as to form a rude resemblance to a human profile, often grotesque enough, but still such as one occasionally sees on human shoulders; and looking at her work, one could not help thinking that after all the *lower animals* are perhaps not so far inferior to us as we suppose.

The art with which Fanchette selected from a bunch of flowers each one that was named to her was really marvellous. Roses, wallflowers, tulips, camellias, were promptly chosen from the number, and it was rare indeed that she made the least mistake. Two centuries ago they would have burned the poor beast for a witch.

The exercise which she preferred to all others consisted in catching on her horns a series of brass rings which her master threw up in the air. This she did with the greatest address; and when she had got a dozen or so of them encircling her brow like a diadem, she would begin jumping and galloping and shaking her head to make them jingle, till, over-excited by their rough music, she would end by dancing in the most fantastic style on her hind-feet, till tired at length with her exertions, she would bound towards her master and throw the rings at his feet.

Among those who had found refuge in the hamlet was a child of five years old, called Marie, the daughter of a peasant whose farm had been burned by the invaders. She was an object of general interest in the little colony on account of her gentle manners, and the sweet but suffering expression of her pale infantine features. A year or two previously she had been so severely bitten in the arm by a vicious dog that the limb had to be amputated, and her delicate constitution had never recovered the shock. Fanchette soon took a great fancy to the little girl; and the doctor having advised her to be fed as much as possible upon milk, MacHenry offered that of the goat. It was beautiful to see the pleasure with which the affec-

tionate creature took upon herself the office of nurse, and the avidity with which the child sucked in the grateful nourishment which was giving her new life. Fanchette became every day more and more attached to Marie. She rarely left her, except when wanted by her master for some new study; and when it was ended, and MacHenry set her at liberty, saying: 'Now be off to Marie,' with what joy the creature bounded away, and how rejoiced was the little one to have again by her side her darling Fanchette! Nestling her head under the child's hand, a world of loving things were interchanged in their mute caresses.

It once happened that a lady having in her hand a crown of artificial ivy which she had picked up somewhere, probably the *débris* of a school fête during happier times, placed it on the head of the little Marie. Fanchette, rising on her hind-legs, examined it with comical curiosity; and having made up her mind on the subject, scampered off to an old tree close by, around whose trunk the real ivy twined in thick and glossy wreaths, butted at it with her horns, twisting it round them, and tearing off long trailing garlands. She then ran back in triumph to throw her treasures at the child's feet, saying as clearly as if she had the gift of speech: 'Look! This is better than the coarse imitation they have decked you with; this is the real thing!'

Another day the child was looking at herself in a mirror, and Fanchette immediately began to do the same. The expression of sadness and wonder in her eyes seemed to say so plainly: 'Why are Marie and I so different? If I were like her I could speak to her, and then we should love each other still better!'

One evening Marie, who was sitting by her mother's side, began to fidget and complain of an uneasy sensation in her back. Her mother, busily engaged with some work, and thinking the child was only disposed to be troublesome, examined it slightly, and told her to be quiet; but the poor little thing continued to complain, when, the mother getting out of temper, gave her a sharp slap. Fanchette, who was present at this scene, presented her horns in a threatening attitude to the woman, and gently stroked the shoulders of her little friend with her foot. At the sight of the dumb animal's eloquent appeal, the woman began to relent, and calling the child to her, examined more carefully the state of things, when she found, to her horror, one of those large and poisonous caterpillars called in French '*processionnaires*,' which had painfully irritated the delicate skin of the child.

It was about this time that MacHenry, continuing his artistic labours in spite of all the difficulties of the situation, resolved on taking for the subject of a new picture his goat Fanchette nursing the little Marie. Fanchette lent herself with her usual intelligence and docility to his wishes; and Marie was represented lying among grass and flowers with her four-footed friend bending over her. This picture, which was afterwards regarded as one of MacHenry's best works, obtained the most signal success at the Paris Exhibition of Modern Art—the truthfulness of the design, the freshness of the colouring, and the grace of the composition being equally striking.

But these bright autumn days soon passed away, and many may recollect the bitter cold of the sad

Christmas of that dismal winter. Poor little Marie suffered so severely from it, that after a vain attempt to recall some warmth by lighting a fire of brushwood, the only fuel that could be procured, her mother, as a last resource, put her into her little bed, in the hope that by heaping upon her all the clothing she could procure, the child might regain a little heat; but it was in vain: no heat came, and the blood had almost ceased to circulate in her frozen limbs. At this moment Fanchette arrived, and without waiting for an invitation, sprang upon the bed. It was in vain they tried to drive her away; she only clung the closer to her nursling, and covering the child with her body, soon restored her to warmth and animation.

There was one among the temporary inhabitants of Boulainvilliers for whom Fanchette entertained an unmitigated aversion; this was a knife-grinder of the name of Massicault. His appearance was certainly not calculated to produce a favourable impression, for his features were repulsive and his expression disagreeable. A low forehead, a scowling eye, and a short thick-set figure were the principal physical traits of this personage; nor were they redeemed by those of his moral character. He had for his constant companion a large ill-favoured bull-dog with a spiked collar, who seemed to share all the evil instincts of his master. Every one wondered how the knife-grinder managed to feed this animal at a time when it was so hard to find the merest necessities of life for human beings—and that too without ever seeming to do a hand's turn of work; for all day long he was lounging about, and it was rare indeed to hear the noise of his wheel. When any one—alarmed at the threatening aspect of the brute, who never failed to growl and shew his fangs when approached—asked his master to call him off, Massicault used only to reply with an ill-natured laugh: 'He has not begun yet to eat such big morsels as you; but there's no saying what he may do one of these days!'

MacHenry was sorry that his goat partook of the general dislike to this man. He would have rather wished that she should have tried by her winning caresses to soften his rugged nature, and bring him to love the gentle creature that had gained all other hearts; but as we shall see in the sequel, things turned out very differently.

On one of the last fine days of that sad year, a crowd having gathered round her while her master was amusing himself by exhibiting her intelligence in the selection of the fruit and flowers he named, in which she acquitted herself with her usual sagacity, MacHenry bade her fetch an apple. There were some still hanging on a tree in a neighbouring garden; but instead of running off as usual to the well-known place, she went right up to the knife-grinder, and pushing aside with her paws the skirts of his coat, displayed two pockets stuffed with something, which the crowd, amid shouts of laughter, declared to be stolen apples. The artist tried to call off his goat, and the man drove her away with curses; but two vigorous peasants immediately laid hold of him, and insisted on seeing the contents of the suspicious pockets; which proved to be, as all had supposed, apples stolen from the tree in question. The discovery only increased the rage of Massicault, who swore with the most fearful oaths that he had never touched one of them, and that the

apples found in his possession had been given to him by a friend. Though none believed him, several, in order to get rid of a disagreeable affair, feigned to do so, and he was finally let off; but many thought they had thus got a clew to the authorship of several robberies recently committed to the prejudice of different members of the little community.

This misadventure excited in the knife-grinder a violent hatred against Fanchette, which was heartily shared by his worthy companion the bull-dog. The latter was an object of special terror to poor little Marie. Fanchette seemed to understand the fears of the child, and whenever the dog approached her, she would lower her horns, as if to protect her nursling and defy her enemy. These demonstrations of valour were generally successful, the dog slinking off with glaring eyes and drooping tail.

One day Fanchette nestled up close to her master, putting her foot upon his arm, and having succeeded in gaining his attention, ran off to a particular spot, where she stopped to sniff the grass, and then trotting back, she renewed several times the same manoeuvre. MacHenry, persuaded that something extraordinary must be the matter, rose and followed her. When she reached the spot, putting aside like a terrier dog the long herbage with her feet, she displayed to view a leather pocket-book, which the artist picked up and examined. An instant sufficed to shew that it belonged to the knife-grinder, and its contents proved that this man was one of the numerous spies the Germans had constantly and everywhere in their service. He found besides in this pocket-book, pushed under the covering, the picture of a child, one of those common photographs which have no other merit than a certain resemblance.

The very day that this pocket-book was found a frightful scene took place. Little Marie was sitting on a low stool eating a morsel of bread, which she was sharing with Fanchette, when the bull-dog chanced to pass. The animal stopped for a moment, and looked at her; then as if overcome by the temptation, he suddenly darted at her and snatched at the bread. He was prevented, however, by the goat, and with a toss of her horns she sent the ferocious beast sprawling to some distance; but he was only stunned, not seriously hurt; and furious at his repulse, he sprang upon the poor goat, seized her by the throat, and shook her with rage. Marie uttered piercing shrieks, and MacHenry having got hold of a stick, ran to the rescue. A sharp blow on the head caused the dog to lose his grip of poor Fanchette, and turn against his new enemy, seizing him by the shoulder; but a peasant coming to the assistance of the artist, forced the dog again to let go; and limping off and growling, he at last took refuge beside his master, who all the while had been an unmoved spectator of the scene.

Great was the general grief at the sight of poor Fanchette motionless on the grass, bleeding profusely from the wound in her throat; and strong the indignation excited by the ferocity of the dog and the conduct of its brutal master. Many were the threats muttered against both; and there is little doubt that the dog at least would soon have paid the penalty he deserved had Fanchette's wound been mortal; but on examination it was found to be less serious than it appeared, and her

master's care of her soon effected a complete cure. The inhabitants of the hamlet, however, resolved not to let slip the opportunity for getting rid of the obnoxious knife-grinder. This ill-favoured individual was received whenever he shewed himself with cries of 'Be off and quickly too, and be thankful we do not throttle your wretch of a dog first.'

Unable to resist the general storm of indignation, the man and his worthy companion were about to take their departure; but they had hardly reached the entrance of the village, when they were met by a party bringing along with them an orphan boy of about six or seven years of age, whose parents had been found murdered some days previously in one of the detached cottages of the neighbourhood, which some still ventured to inhabit. The child, at the sight of the knife-grinder and his dog, uttered a loud cry and covered his eyes with his hands.

'What is the matter, my poor little fellow?' asked one of the by-standers. At length he was able with difficulty to reply, his words interrupted with deep sobs: 'That man! that dog! It was they that killed my mother! I saw it all from behind the curtain in which I was hid.'

Every one looked in astonishment at his neighbour, not knowing whether to believe the strange assertion of the child; when MacHenry produced the pocket-book and informed those around him of its contents. The child immediately cried out that it was his mother's; and had any doubt remained it would have been dispelled by looking at the portrait that was contained in it, for its resemblance to the poor little boy was striking.

In presence of such proof, there could be no hesitation, and two men immediately set off in pursuit of the fugitive; but he had already got a considerable advance, and fear lent him wings, so that before they could reach him he had gained the protection of the German outposts. He did not succeed, however, in evading the fate he merited, for shortly after the news arrived that the wretched man had fallen into the hands of a detachment of French *francs-tireurs*, and having been convicted of being concerned in the burning of a farm, was immediately condemned and shot.

MacHenry adopted the orphan boy, and never had cause to repent of his generous action. 'I have now two children,' he used gaily to say; 'for my gentle intelligent Fanchette is almost as dear to me as if she were a human creature!'

LIME-JUICE.

SOME interesting facts have been communicated to us, arising out of the publication of our recent article on 'Lime-Juice' (March 24, 1877). It appears that some years ago Messrs Sturge of Birmingham established a Company for developing the resources of the island of Montserrat in the West Indies. Attention was directed chiefly to the production of genuine lime-juice, mainly for the extraction therefrom of citric acid, of which Messrs Sturge are extensive manufacturers in this country. With this object in view, they paid sedulous attention to the maintenance of extensive lime-tree plantations. All the ripe sound fresh fruit is selected first, for the production of lime-juice, while the remainder becomes available for citric acid. The juice is bottled

immediately on its arrival in this country. In 1874 the Company were the owners of no less than five hundred lime-trees in full bearing in the little island of Montserrat; and the number has since been increased by the conversion of unprofitable sugar-plantations into profitable lime-tree plantations. The collection and manipulation of the ripe limes give healthy employment to large numbers of women and young persons.

When Dr Leach, medical officer on board the *Dreadnought*, called public attention in 1866 to the recent appearance of scurvy in merchant-ships, he induced the Board of Trade to take up the matter seriously. This led to the passing of an Act in 1867, ordering the provision of lime-juice or lemon-juice in every merchant and passenger ship, and its use every day by every person on board. It is, however, known that lemon-juice is not so effective as lime-juice as an anti-scorbutic; and that, moreover, the best lime-juice does not require to be 'fortified' with ten or fifteen per cent. of alcohol to preserve it, which appears to be necessary for lemon-juice and inferior lime-juice. In the navy more strictness is observed. Lime-juice only is permitted; it must be prepared from ripe sound fruit, gathered in particular months of the year; and must bear analytical tests touching its citricity, flavour, and condition. As a consequence, scurvy is now almost unknown in the royal navy, except in the case of the recent Arctic Expedition, the particulars of which will no doubt be fully investigated and set forth by the Admiralty Committee duly appointed for that purpose. The navy is, we believe, supplied invariably with the best lime-juice only, to the exclusion of lemon-juice, and also to the exclusion of such juice of the real lime as requires, on account of its poorness of quality, to be fortified or 'doctored' with strong crude spirit. Very likely, in this as in so many other instances, cheapness is at the bottom of the whole affair: mercantile lemon-juice (even if called by the name of the lime) being cheaper than navy lime-juice. If so, it affords a sad instance of the misuse of the good word economy; for it certainly is not economical to imperil the health of the crews in trading-ships, and of passengers in emigrant-ships, by the use of that which is 'cheap and nasty.' Something there is in the common juice which renders it very unpalatable to the men, who often shirk their prescribed dose unless strictly watched. Let us hope that the Report of the Arctic Committee will strengthen the hands of the Board of Trade to deal with this matter.

AFFECTION IN BIRD-LIFE.

A CORRESPONDENT having read our recent article on Bird-affection, kindly sends us the following singular instance of intelligence and affection on the part of a duck. 'We have,' he tells us, 'two white ducks; the one designated Mr Yellow-bill being wonderfully intelligent, yet fond of fun. My little son and he have great games together. The lad throws out an india-rubber ball a longer or shorter distance, leaving it for the bird to decide whether it shall be pursued with a flying or a running movement. In either case, the ball is swiftly seized by duckie, and returned to the thrower, who keeps up the game until both have had enough of it. Another peculiarity of Mr Yel-

lowbill may be mentioned. At the splashing of water from an adjacent well he is aroused, and will instantly fly towards the scene of action, plunge in, bathe, jump out, flap his wings joyfully, and "like a bird," take himself off again. But the story of affection for his kind must now be told. The other day, when swinging on a gate, my little boy felt something tugging at his trousers, and on looking round discovered the duck, who, he supposed, invited him to a game at ball. So down he got, and caressed his feathered friend as the preliminary. The duck, however, continued pulling away in so unusual and persistent a manner that the lad decided to go whither he was led; and lo! at the corner of an outbuilding was found poor Mrs Yellowbill, lame of a leg and quite unable to waddle along. Meanwhile her husband continued to manifest the greatest concern about her, yet did not forget his manners and grateful acknowledgments, but bowed and better bowed to those around who had now come to the rescue; shewing that even a duck may act and feel as a gentleman. The cause of hurt referred to has not been ascertained; but happily Mrs Yellowbill is now quite well, and her husband is as lively as ever.'

LENACHLUTEN,

A WATERFALL IN ARGYLESHIRE.

'Mong crags where the purple heather grows,
'Mid rocks where blooms the mountain rose,
Onward the river calmly flows
To Lenachluten.

The waters dash on the rocks beneath,
In a mad wild rush, they surge and seethe,
While dancing spray with a snowy wreath
Crowns Lenachluten.

Thus ever the stream of life flows on,
With faces happy and faces wan,
A moment here on this earth, then gone,
Like Lenachluten.

Some lives pass on like a peaceful dream;
Untouched by sorrow or care, they seem
To glide as the river whose waters stream
Towards Lenachluten.

Others career on their restless way;
Whate'er betide, they are ever gay,
As gleams the sparkling sunlit spray
On Lenachluten.

Some lives with folly and sin are fraught;
They dim earth's beauty with stain and spot,
As surges the scum, an ugly blot
On Lenachluten.

And now and again a genius bright
Dazzles the earth with his spirit's flight,
As shimmers the rainbow's tinted light
O'er Lenachluten.

A HOLIDAY IN THE LAKE-COUNTRY.

LET those who have not as yet made up their minds how or where to spend their summer holiday, turn their steps towards Lakeland. There, beauty ever changing and ever charming in all her multiform varieties, lies in wait for them at every turn. Life too among the hills has a free hearty zest, born of the invigorating mountain breezes, which you search for in vain elsewhere. The wind, as it sweeps along the hill-side, recalls, as it fans the weary brow, the quick glad feeling of existence, the exuberance of gay animal spirits, which were natural and unprized in careless boyhood, but which are too often extinguished by the cares assumed with advancing years.

The steep roads, the green hill-slopes, the peaceful mossy boulders, the picturesque nooks, in which nestle quaint little homesteads, and the broad calm lake stretching out like a great embossed silver shield at your feet, with the deep shadows of the hills shading into purple gloom in its shining ripples—who that has once seen such a picture, particularly in sunshine, can ever forget it!

In winter evenings, when the curtains are snugly drawn, and the howling storm shut out, and the firelight tinges all around with its warm ruddy glow, pleasant visions of the breezy fells, and the great hills with their changeful lights and shadows, and the leafy copses running down to the edge of the water, recur to the memory. You are again in the swiftly gliding boat; you lean over to gather the water-lilies, or to gaze into the clear pebbly-bottomed abysses of that softly yielding flood. Again you see mirrored in its crystal depths the straggling rifts of vapour, or the long rippling beaches of cloud. The sweet do-nothingness of the hour, its gay insouciance, or its vanished romance, are with you once more, and charm you as of old. It is with a feeling of half-sad tenderness that you turn away from the mental photograph, and leaving it safe in memory's keeping, go back to your busy commonplace world.

Mr Payn, in his beautiful volume entitled *The Lakes in Sunshine* (Windermere: J. Garnett), gives

us a sparkling description of Lakeland. He begins with Windermere, because, as he says, 'the scenery of the northern lakes is unquestionably grander and wilder, and they should therefore be seen after their southern sisters.' Almost every one has seen Windermere, the queen of English lakes. Many have seen it as Mr Payn says it is best seen—by a

Fair couple linked in happy nuptial league
Alone.

To such, a magic charm clings ever afterwards to each tree and shrub, investing those never-to-be-forgotten days of delicious idling on its pleasant shores with a glory peculiarly their own.

Among the distinguished people who have done Windermere and climbed Orrest Head, to gaze from thence upon the panorama of lake and mountain and wooded hill and sea which stretch around, was Beau Brummel, who was, however, much too fine a gentleman to get up any unfashionable enthusiasm upon the subject. 'Charles,' he would draw out to his valet, when he was asked which of the lakes was his favourite—'Charles, which lake was it we liked best?'

Immediately beneath the tourist, as he stands on Orrest Head, is Elleray, where 'Christopher North' spent so much of his time. He loved the mountains around, and might be met upon them in all weathers, in shine or shower; the shower of course, as is the case all throughout Lakeland, predominating greatly. As a rule the weather is moist and often wet, although the dalesmen do not like to have it called so, or to have any exceptions taken to the lack of sunshine. They are as irritable upon the subject as a certain Parsee grandee was, who when his venerable ecclesiastical host, finding a dearth of topics of conversation, fell back upon that standing British theme the weather, and blandly observed: 'We have not seen the sun, Sir Jamsetjee, for many a day,' shut him up abruptly with a stern: 'And what is that to you, sir? The sun is my god.'

In like manner mist and rain, the tutelary genii of Lakeland, are under the special protection of the aborigines. There are a number of pretty

'Yes, dear, he is good;' beginning at last to find it pleasant to talk about him.

'The idea of your having such a lover hidden up in your thoughts all the time we were worrying your life out with our troubles! How could you have so much patience and sympathy with us—with me?'

'Perhaps, Lillian, for the very reason that he was hidden up in my thoughts.'

'Well, perhaps it was: yes; I can understand that, Mary;' adding with a little sigh, 'and I think I can guess now why you did not like talking about your happiness to me, dear kind sister that you are!'

'I am glad that you like Philip, Lillian.'

'Like him! Of course I do; though there is not much credit in liking one so nice as he is, I suppose. He knows how to pay compliments too. Do you know he paid me such a nice one, Mary? He said that I reminded him of you, and that he could trace the influence of your mind upon mine. I stupidly all the while never guessing the truth! The idea of your having been engaged for ten years, and once so nearly married, without your sister knowing anything about it!'

Afterwards there were dear old Mrs Tipper's congratulations to listen to. But although she was quite as ready as Lillian to say kind things, and evidently wished to make me understand that she was pleased for my sake, there was the shadow of a regret in her eyes, and I thought I knew the reason why.

Pleasant as it all was, it was even pleasanter to be once more alone with my thoughts. I sat by the open window half through the summer night, my elbows on the sill and my chin in my hands, trying to get used to my happiness. 'Tired nature sunk into repose, scarce told of life;' but a light breath of sound—the faint twitter of a bird—the whispering of the air amongst the roses clustering round the window—or the soft rustle of a leaf, seemed to hint that it was dreaming musically, as befitted a world watched over by the 'silent sentinels of the night.' It was early dawn before I was sufficiently sobered to betake myself to bed and attempt to sleep.

When at length sleep came, it was no love-vision which visited me, only a miserable distortion of what had taken place, as though some evil spirit were mocking my hopes. I rose pale and unrefreshed. The blooming process had certainly not commenced yet, I jestingly informed myself, as I tried to smile at the heavy lack-lustre eyes and white face which my glass reflected. I could afford no more star-gazing; requiring all the proverbial beauty-sleep I was able to compass. But I made the best of myself; and in my pretty fresh morning-dress was, I flattered myself, somewhat brighter and pleasanter to look upon than I had been the night before. Lillian came in before I had quite finished, to 'see after me,' she said, with a tender greeting.

'To begin with: I will not have that beautiful throat so muffled up; and I will have a bow in your hair and this flower in your dress. Now don't be obstreperous. Where is the use of being a sister, if I may not have such little privileges as this, I should like to know!' busily putting a little touch here and a little touch there to my toilet.

'Yes; that is certainly better—now you look

kissable, my dear;' with a gay little laugh at my consciousness. 'It shews beautifully now!'

'What shews, goosy?'

'The love and happiness, and all the rest of it, child. Only look like that when he comes in, and I shall be quite satisfied. And remember, Mary, not that mean old bonnet again—not for the world! Did you order a new and fashionable one as I bade you, madam?'

I murmured something about a new bonnet being on its way, but could not speak positively as to its pleasing her.

'If you have ordered another old-fashioned-looking thing, it will have to be taken back to the place from whence it came; that's all, my dear. And until it comes, you must wear your garden-hat; it is twenty times more becoming than that old dowdy thing of a bonnet; and I have been up since five o'clock, if you please, making it pretty with new ribbon and a few poppies.'

'Dear Lillian—sister!'

'Tears! Good gracious, Mary, what are you thinking of? Pray, consider your nose; pray, do not spoil the effect! Yes; that's better; that will do, my dear;' with a grave little nod of approval, as I broke into a smile again.

It certainly was rather amusing. To judge by her tone, and without looking at her, she might have been supposed to be an elder sister admonishing and encouraging a shy young girl. Ah me! the diffidence I felt arose from a very different cause, and was of a very different kind from the diffidence of a young girl. It was nevertheless very delightful to have her hovering about me thus; her love so palpable in every word, and look, and tone. It was doubly precious to me just now; and perhaps she guessed that it was. By the time we were summoned to breakfast, she had succeeded in chasing away some of my morbid fancies; and she did not allow me to fall back again, keeping up a constant patter of merry speeches; at which her aunt and I were forced to smile.

Whether Lillian was beginning to see deeper into my mind than she had heretofore done, I know not; but one thing was evident: she could see the kind of treatment I required, and talked no sentiment. Mrs Tipper looked a little surprised at her unwonted gaiety, but very agreeably surprised. Lillian never appeared to greater advantage than in these playful moods.

'Of course you and I must be considerate when Mr Dallas is here, aunty; in the way of finding our presence required elsewhere, and making occasional discreet little disappearances, you know.'

'Nonsense! as though I would allow such a thing!' I replied laughingly.

'And as though such an experienced person as I did not know the right and proper thing to do!'

She could even jest about her experience. 'Then I mean to shew you that the most experienced people may sometimes err in their notions as to what is right and proper,' I rejoined lightly.

But when, just as we had finished breakfast, Lillian desisted Philip coming down the lane, she ran off with a gay look over her shoulder at me. Mrs Tipper was already in the kitchen, in solemn consultation with Becky over the contents of the larder, intent upon making Philip an honoured guest. Of course I very quickly had

Lilian in with us, and allowed no more discreet disappearances. Indeed in the first moments of my happiness it was sufficient to me to feel that Philip was present. There was even a kind of relief in having Lilian with us; and he soon found that anything which interested him and me might be freely discussed in her presence.

It was a glorious morning, and we betook ourselves to the 'drawing-room.' The windows were flung wide; and it was delightful to look from the cool shaded room to the lovely scene beyond, bathed in sunshine, the shadows of the light fleecy clouds sailing in the bright blue sky chasing each other up the hillside; whilst an occasional sound, the few-and-far-between strokes of the blacksmith's hammer, or the laugh of a child at play, floated lazily towards us from the village; even the proverbially busy bee seemed to hum drowsily in the perfume-laden air.

We agreed that it was a morning expressly intended to be spent in the half-idle wholly enjoyable way we spent it: renewing acquaintance with bits from our favourite authors, trying scraps of songs, &c., Lilian now accompanying him, and now me. Then there were our sketches to be examined and criticised—have I said Philip was no mean artist?—and our studies to be talked over, which brought us to Robert Wentworth.

I had already made Philip acquainted with him, so far as it could be done by letter, and unfortunately, as I now felt it to be, I had given more than one hint of my hopes and expectations respecting Lilian and Robert Wentworth. It was therefore natural enough that Philip should watch her a little curiously when the other's name was mentioned.

'He must be a fine fellow!' heartily said Philip, when Lilian quoted some remark of Robert Wentworth's.

'He is good,' simply replied Lilian. 'Not very fine, but good.'

'If you interpret what I say so very literally as all that, I shall have to be very careful in the choice of my words, Miss Maitland,' laughed Philip.

'I do not want you to be disappointed in him, even at first; and he is plain, and rather old.'

Plain, and rather old! That was *not* Robert Wentworth to me; but I recollected that I was not a girl between seventeen and eighteen, and made no comment.

Lilian looked flushed and nervous as she slipped her hand into mine, and went on in a low grave voice to him: 'Could not Mary's sister be—Lilian?'

He bowed low, with a murmured word or two about his appreciation of the privilege; and seeing that her face was still shadowed by the recollection which his use of her mother's name had called up, he presently contrived to lead to less embarrassing subjects.

After early dinner—Philip had begged that no difference should be made in the hour on his account—we went into the woods, to pass the afternoon under the grand old trees; taking with us books, needlework, sketching materials, and what not, with the persuasion that we did not mean to be wholly idle. Philip said that it was done for the purpose of impressing him with due reverence for our talents; but declared that it was only idle people who could not enjoy being idle.

He spread all the aids and appliances picturesquely about us.

'There; that ought to do, I think. The most conscientious of workers ought to be satisfied with that—no one would venture to call you idle now!' he ejaculated, throwing himself on to the turf beside us, his hands clasped at the back of his head and his gray eyes full of fun and mischief.

'The idea of your thinking you will have nothing to do but watch us!' said Lilian. 'We shall want lots of help; shall we not, Mary? water fetched, and pencils cut, and'—

'No, no; I am sure you are above that sort of thing. Isn't it becoming the fashion for ladies to be independent?'—persuasively.

'We are old-fashioned, and like to be waited upon.'

He laughed. 'I should like to be useful, of course. But wouldn't you find me useful to point a moral? Suppose you were to illustrate the evils of laziness, for instance, and make me the example; eh, Mary?'—tossing a bit of twig on to my work.

'As though I would encourage you that way!'

'Shew that dimple again, if you please, Miss Haddon!'

'You absurd person!'

'Thank you.'

'I feel an inclination to be discreet coming on,' whispered Lilian.

'Repress it at once,' I replied very decidedly.

Ah, what pleasant nonsense it was! The woods rang out with many a merry laugh at our quips and cranks and gay *badinage* that afternoon. Philip affirmed that our lives had been too sombre and severe, and that he had only arrived just in time to rescue us from becoming 'superior' women. The brightening-up process devolved upon him. We could not deny that he had the power. Lilian altogether got rid of her shyness, and was almost as frank and outspoken with him as with me. She gaily claimed to be considered his sister by-and-by; and drew an amusing picture of herself in the future as a model old maid. 'Not prim and proper, you know—no, indeed; I intend to be a nice little round woman, to go about loving and comforting people.'

Philip confessed that he did not greatly affect old maids, but gravely opined that being round might make a difference.

I defended them as a 'worshipful body,' round or square; though I did not believe that Lilian would be allowed to be of the guild.

Lilian thought she would use her own judgment about it; but I recommended her asking Mr Wyatt's advice. At which I was pelted with bits of grass.

And so passed the hours away until Becky came to summon us to tea. She gazed so long and so curiously at Philip, who happened to be talking to Lilian whilst she gave Mrs Tipper's message, that I touched his arm and explained in a little aside that this was the Becky I had told him about, and that Becky's good opinion was worth something.

O yes; he had not forgotten; she was my protégée, he replied; going on to address himself to her, asking her whether she approved of his coming to take me away by-and-by.

Perhaps it was his jesting manner which she could not understand; perhaps it was some defect in herself—whatever might be the cause, I saw that Becky was not so much impressed in his

favour as the others had been. Her quiet decided 'No, sir!' highly amused him.

'Not if Miss Haddon wishes to be taken away, Becky?'

But he could not get her to say any more. When he asked for reasons, she only shook her head, turning her eyes from him to me.

He tried banter. 'I understood that Miss Haddon was a favourite of yours, Becky.'

She did not appear to be at all anxious to defend herself to him, and she knew that it was not necessary to me. She stood aside for us to pass without a word; though I saw she eyed him steadily the while. Moreover, I found Becky a little cross-grained, when later I made occasion to ask what she thought of Mr Dallas. 'He is not so nice-looking as Mr Wentworth, Miss, to my mind,' was all she would say; and as I knew that those whom Becky liked were always good-looking, and those whom she did not affect were plain, I could draw my own conclusions. I was foolish enough to be a little annoyed, replying somewhat sharply: 'If you do not like Mr Dallas, you yourself, and not he, will be to blame for it, Becky.'

'Very well, Miss.'

Something in the expression of her eyes as she turned away made me add: 'Do not you think you ought to be inclined a little favourably towards the gentleman I am going to marry, Becky?'

'Yes, Miss; I know I ought;' in a low faltering voice. And that was all I got out of Becky.

RUSSIA AND HER PEOPLE

A SKETCH.

THE outbreak of war in the east of Europe has directed the attention of the English people to Russia, with a pretty generally expressed desire to become more acquainted with a country which may be destined in the future to play a greater part than it has yet done in the history of the world. This desire is a commendable one, for when two nations shew a mutual longing to become better known to each other, the risk of quarrelling is eventually reduced to a minimum, and as in the case of England and France, a free, hearty, and unchecked intercourse removes in a wonderfully short time whole ages of prejudice and ill-will.

Russia is, however, a difficult country to become acquainted with, for the traveller finds himself in an unfamiliar land, peopled by a race of whose thoughts and feelings he knows as little as he does of their language; and the information he receives from the persons he questions is either meagre or untrustworthy.

Her police regulations are vexatious; and on entering an hotel the traveller is bound, under awkward penalties, to give an exhaustive account of himself in a book kept for the purpose, and not only to enter into intimate relations with the authorities, but to have his mind made up as to his plans, and to purchase a *permis de séjour* or *de voyage* for a certain number of days; and this leave must not be exceeded without an authoritative extension of it.

The travelling arrangements for those who

choose to use rail or steamer are pleasant, if one does not object to a rather oppressive atmosphere in the carriages, for during the greater part of the year the Russian's chief idea is to protect himself against the inclement climate; and as he keeps the windows and doors of the public conveyances hermetically closed, involuntary contact with him becomes anything but agreeable. But if the traveller wishes to gain an intimate acquaintance with Russia, and to see what is the real life of the people apart from towns and highways, he must be prepared to take many a long and tedious journey in a kind of lumbering cradle on wheels, or peasant's springless cart; for in some vehicle of this kind he will have to be bumped and jolted the livelong day, plagued with dust and heat in the summer, and in winter liable to frost-bite and snow-blindness; while he will probably be unable to get any food beyond what he carries with him except black bread, pickled cucumbers, and sometimes eggs. He will also have to sleep at night in fusty rooms, which are often without beds, and are almost invariably teeming with insects.

The northern portion of Russia consists chiefly of forest-land and morass, plentifully supplied with water, and broken up by numerous patches of cultivation; and the villages are generally composed of gray huts built on each side of a straight road which at times becomes a river of mud.

The big white church with its fine pear-shaped cupolas rising out of a bright green roof; the meadow in the foreground, through which meanders a sluggish stream; the whitewashed manor-house, with a verandah in front, standing on a bit of rising ground, and half concealed by a cluster of old rich-coloured pines: none of these details are beautiful in themselves, but all combine to form a very pleasant picture when seen from a distance, especially in the soft evening twilight. Every little household in these villages is a kind of primitive labour association, the members of which have all things in common, and submit to the arbitrary will of the Khosain or head of the family; while the wife of the Russian peasant is a very unromantic style of female, with very little sentiment in her otherwise kindly nature; but she manages to bring up her children on what is the veriest pittance of a wage, in a manner that would do credit to many better situated English peasant-women. In the north-eastern provinces of Russia the peasant has an extremely hard fight to maintain against the hostile forces of Nature, his field-labour sometimes resulting in no gain at all. He makes a living in various ways; and for whole days he wanders through the trackless forests in search of game; or he spends a month away from his home, fishing in some distant lake; or else devotes the summer to deep-sea fishing, bringing home, if he is lucky and frugal, enough money to tide him and his family over the winter.

In the excellent work, '*Russia*,' by D. Mackenzie Wallace, M.A., 1877, from which we derive many of our facts, the author presents us with a 'family budget,' which will give a good idea of the expenditure of a peasant household in the far north. Its income during a tolerably prosperous year was L.12, 5s., chiefly obtained from the sale of game and fish. The expenditure was L.7, spent on ryemeal (2240 pounds), to supply the deficit of the harvest; L.3 on clothes, tackle, and ammunition; and L.2, 6s. paid in taxes.

As the peasant family of the old type is a kind of primitive association in which the members have their goods in common, so the village may be described as a primitive association on a larger scale. It has an administrator at its head, whose power is limited by the will of the heads of households themselves, forming a kind of village parliament, which is directly responsible to the state for the due and timely payment of all tithes and taxes. Various are the matters with which this village parliament has to deal, from the election of office-holders and the periodical collection of the taxes up to the redistribution of communal land—a subject which is often the occasion of lively scenes. But when once a decision is given, it is respected as scrupulously as any of the 'Acts' of our own House of Commons.

Thus we see in Russia the 'commune,' or 'mir' as it is called there, in full working order; and in a country ruled over by a despotic monarch it is perhaps the nearest approach to municipal or constitutional institutions that can with safety be attempted. The mir was instituted by the present Emperor or Czar, when he carried out that wise and humane act which will for ever be associated with his name—namely the emancipation of the serfs; and it has scarcely been long enough in existence yet to predict what form it may ultimately assume.

The Russian peasantry are, for the most part, grossly superstitious, and this may be owing in no small degree to the very inferior religious teaching to which they are accustomed; for we are told that they have not the faintest conception of anything like an inner religious life, but are the slaves of mere rites and ceremonies. For example, though a robber will kill a peasant on the highway, such are his religious scruples, that he will not eat a piece of cooked meat which he may find in his victim's cart, because perhaps it is a fast-day; and an artisan when about to break into the house of an Austrian attaché in St Petersburg, first entered a church and commended his undertaking to the protection of the saints, then killed the attaché in question. It is a species of grim fanaticism which binds the masses in Russia. The shrines in the public places are crowded with worshippers, who cover with their kisses the gilded pictures, while showers of small coins or copper money rattle into the boxes, which the priests hold in their hands. From these and other circumstances, we are warranted in saying that the Russo-Greek Church is about the most debased form of Christianity.

Not very high above the working classes of the towns in the matter of intellectual culture, come the traders. Many of them are very rich, but exceedingly ignorant, and do not bear a high character for honesty; but like every other class in Russia, this one also is being affected by the great changes which are taking place, and by which the old spirit of caste is dying out; while a number of nobles are infusing new ideas into mercantile circles.

Far above the trading classes stand the members of the official circles, who spend their days at their desks, and while away their evenings at card-playing, which is carried on to an extent unsurpassed in any country in Europe. This is doubtless owing to the eternal dullness which pervades Russian towns, but which one of their poets has declared to

be the essential characteristic of Russian provincial life.

We come now to the *nobles* of Russia, of whom there is a very considerable number; but very small value is attached to a mere title, and there are hundreds of princes and princesses who have not the right to appear at court, and who would not be admitted into what is called in St Petersburg *La Société*, or for the matter of that, into refined society in any country. For instance, not long ago a certain Prince Krapotkin gained his living as a cabman in the Russian capital. The only genuine Russian title is *Knyaz*, which is commonly translated 'Prince.' The bearers of this title are the descendants of Rurik, of the Lithuanian Ghedimin, of the Tartar chiefs who were officially recognised by the czars, and of fourteen families who adopted it by imperial command during the last two centuries. Peter the Great introduced the foreign titles of Count and Baron, he and his successors conferring the title of count on sixty-seven families, and of baron on ten. Of the noble families, very few are rich, and none of them possess a shadow of political influence.

There are more than a hundred thousand landed proprietors in Russia, but it must not be inferred from this that they are equal in point of wealth to our landed gentry at home. Such is very far from being the case, for many of them are in a state of poverty, the wealthy ones not exceeding four thousand in number. This latter class includes two distinct schools of landowners, so to speak; those of the old school being described as 'contented, good-natured, hospitable, but indolent, apathetic, and dull;' while those of the later are a roystering boisterous set, fond of drinking and dissipation, and possessing a morbid passion for sport of all kinds, however demoralising or degrading it may be.

All travellers in Russia, from Dr Clarke downwards, have been astonished, and not a little disgusted with the depravity of official life. The taking of bribes by persons in authority seems to be universal, and has been represented as arising in some measure from the inadequacy of salaries. From whatever cause, this forms a blot on Russian society, and which we hope may disappear with the progress of education and intelligence.

In Russia, it is somewhat satisfactory to learn, Mohammedans and Christians get on very well together, and not only help each other, but take it in turns to be at the head of their several communes. This shews that under a tolerably good government the two races may enjoy a great amount of good-fellowship and freedom, without any reference whatever to religious differences.

All are loyal subjects of the Czar, to whom all Russians, of whatever rank or religion, yield an unhesitating and child-like obedience. But even this great measure of loyalty does not prevent them from occasionally resisting his authority when great interests are at stake, as is proved by the existence through many centuries of a secret society called the 'Raskol,' which all the power of the Russian emperors has failed to dissolve. So long as the Czar, however, identifies himself with the enthusiasm of his subjects, and especially the religious portion of them, his authority within his dominions is irresistible; but should his policy ever come into collision with the teachings of the clergy and the feelings of their flocks, the rever-

ence paid to his sovereignty might be rudely shaken.

The saddest sight in Russia to a traveller is the manner in which civil prisoners are treated. It is a common spectacle to see three or four hundred poor wretches on their way to Siberia under a military escort; for most of them are chained together in couples, while the women and children who have elected to share their bread-winners' lot have also to submit to be treated as criminals. Poorly clad, and apparently half-starved, the wonder is that any of the party should ever survive the dreadful journey. A Russian criminal condemned to exile is sent away with very little ceremony; but when an officer of the army or other person of note has been sentenced to banishment for life, he is dressed in full uniform, and led to a scaffold in some public place. In the presence of the crowd he is made to kneel while his epaulets and decorations are torn from his coat and his sword broken over his head. He is declared legally dead; his estates are confiscated, and his wife can consider herself a widow if she so chooses. From the scaffold he starts on his journey for Siberia. His wife and children, sisters or mother, can follow or accompany him if they choose, but only on condition that they share his exile.

Mr Arnold in his book entitled *Through Persia by Caravan*, relates how, when passing through Russia, he saw a party of prisoners embarked on board a steamer on the river Volga. They were positively caged amid-ships, so that every part of the interior could be seen, just as in the lion-houses of the Zoological Gardens, with this difference—that in the case of the prisoners there was no overhanging roof to prevent rain or sunshine from pouring in upon their wretchedness. At the back of the cage there was a *lair* common to all, without distinction of sex or age. And when all were secured, including the guiltless women and children, fights occurred for the places least exposed to the east wind. This is a system which must surely fade away beneath that public opinion which is fast becoming too strong for even autocratic monarchs to despise; for we are told that the emancipation of the Russian serfs has made a vast legal, social, and material improvement in the lower orders of the people; and it is to the people that the world will look for that much-needed reform, which will enable Russia, perhaps at no distant day, to take an honourable place amongst civilised nations.

An anecdote is related by Mr Wallace, who, upon one occasion when travelling on the great plain which stretches from the Sea of Azov to the Caspian, observed on the map the name *Shottland-skaya Koloniya* (Scotch colony). Being curious to ascertain why a village was so called, he made a pilgrimage thither and made inquiry. No one could tell him; but at last he was advised to ask an old Circassian, who was supposed to be learned in local antiquities. To this man he put a question in the Russian tongue, explaining that he was a Scotchman, and hoped to be able to find a fellow-countryman in the village; whereupon the old Circassian replied in broad Scotch: 'Why, man, I'm a Scotchman too!' He explained, however, that he was only a 'Circassian Scotchman,' being a native of the Caucasus; and as a child, had been purchased and brought up by the Scotch missionaries, who were then patronised by

Alexander I., but were suppressed in the year 1835 by Nicholas.

Those of our readers who may wish for detailed information as to the general condition of Russia and her people, may safely be referred to Mr Wallace's interesting work.

THE DUKE'S PIPER:

A STORY OF THE WEST HIGHLANDS.

IN FOUR CHAPTERS.—CHAPTER I.

It was an unfortunate business—most unfortunate; for the Duke's piper and the Duke's game-keeper were the best of friends; they never met at the Glengolly clachan but they had their 'glass' together; nay, when friends met, such as they—and it was astonishing how often accident led the steps of both men to the smoky chimney-cheek of Betty MacDonald's clachan—the glass had to pass to and fro pretty often before the men parted. And as Betty knew full well that John Cameron the piper, and Donald MacTavish the game-keeper, her best customers all the year round, were critics upon whom no adulterated or diluted fluid could impose, Betty was careful that to them at least nothing but the best of whisky and stoup-measures—erring, if they erred at all, on the roomy side—should be served. The natural result of such companionship and mutual consumption of frequent gills was that John loved Donald 'like a vera brither;' while Donald frequently assured John, as they stumbled over the moor together in the gloaming, or more often when the horned moon was high, that not one of his own eight brothers was to be mentioned in the same breath with John—as regarded his, the game-keeper's, emotions towards him.

What then were Betty's feelings, late one unlucky autumn evening on her return from the byre, where she had gone to milk her solitary cow, to find the two friends in the midst of a hot argument, loud-mouthed both, and looking at each other across the table, on which stood the almost empty measure and glasses, with expressions on their honest gnarled faces that could hardly by any interpretation be termed mild? And this before a third guest too, a hairy-visaged gentleman whom Betty reckoned half-daft, seeing that he had spent the last three weeks 'splashin' a bit o' auld canvas wi' paint, and ca'd it Ben Sluaigh,' but to whom it nevertheless beloved her to be polite, taking into account the liberal rent he paid for her best room. The gentleman sat in his chair with a tumbler of whisky-and-water before him, taking little part in the discussion, but smoking diligently with a broad grin, as Betty noted indignantly as she went 'ben' with her knitting, sorry to hear the voices of the disputants waxing louder and louder. Betty had a feminine dislike of argument; arguments in the clachan were generally the prelude to blows. Her idea of a 'good crack' admitted only of varying shades, not differences of opinion, softened by frequent application to the bottle—a good story being not one whit the less welcome because oft-told. But here were John and Donald glaring at each other with knit brows, and John, who could never brook contradiction, bringing his massive fist down on the table so that the stoup-measure and glasses swayed.

'Ye're wrang, Tonald, I tell ye again ye're wrang—it *wass* biled !'

The game-keeper thus addressed, only shook his bald head slowly from side to side, remarking after a pause, with a smile of superior knowledge that seemed to fan the flame of his friend's anger: 'Na, John, na: it iss nefer biled.'

'But it *iss* biled, and *iss* aye biled, I'm telling ye, and biled in sweet milk too.—I'm not like some folk, sir,' said the piper, turning to address the stranger in the arm-chair, 'that talk a lot o' nonsense apoot what they ken naething apoot.'

'Whether his oil-cake was boiled or not boiled,' said the stranger, 'the bull is as fine an animal as I have seen in the Highlands; though I was not sorry, as I sketched him, to have the stream and a good steep bank between us.'

'Noo, John, you are trying to impose on the ignorance o' the shentleman; that iss what ye are trying to do, John, and that iss no like ye. It iss verra pad to let the English shentleman go away, and it iss savages that he'll pe thinkin' we are in the Hielants, to pe feeding oor young bulls' (pronounced bills) 'wi biled oil-cake, as if oor young bulls needet oil-cake when they hef cood green grass and plenty; or alloo'in they do need it, to hef it biled, and them wi' teeth that if they wanted wad crack whinstanes. Oh, but it iss a fine joke to hear ye talk o' biled oil-cake, John Cameron !'

'I'm telling ye, ye're wrang,' said the piper hotly; 'and it iss nonsense ye're talking apoot, Tonald MacTavish !—Though, sir,' again appealing to the stranger's intelligence, 'it iss not muckle that a game-keeper can ken apoot the rearing o' young bulls; they can tell a grouse from a part-ridge in a stubble-field on a dark nicht, I'll alloo that,' in a tone implying that he conceded the utmost; 'but the rearing o' young bulls iss oot o' their line; and for a man that has nefer peen oot o' his ain county from the tay he wass born till the tay o' his death, to teach anither man wha has peen round the whole world moreofer wi' his Grace the Teuk—to tell *him* apoot savages'—

'I alloo,' interrupted Donald with a friendly wave of the hand, having filled and emptied a glass while John was speaking—'I alloo that there iss no petter piper in the county—no, nor in the whole Hielants moreofer, than yoursel', John Cameron; and it iss the Teuk himself I hef heard say as muckle many's the time that; and prood I hef peen to hear it; and I hope it iss to this shentleman and me that ye will pe giving a tune afore we pairt the nicht; but I canna alloo that ye are petter acquaint wi' the subject on hand. And ye can ask Sandy the Deuk's grieve yoursel' apoot it, and he wass in the byre when the bull wass calfed, and he will'—

'Teffle a tune ye'll get from me this nicht; and it iss a obstinate mule ye are, Tonald MacTavish, and always wass; and as for Sandy MacIntyre, the Teuk's grieve, it iss all the parish that kens him for a foolish ignorant liar !'

The two men pushed their respective chairs a foot or so farther apart, and looked at each other in no amiable mood. John the piper was a tall thin Celt with fiery eyes, that flamed out from a mass of tangled hair as brown as heather, covering a low square brow; he was of a much more inflammable temperament than his friend, whose high cheek-bones, wide surly mouth, and cheeks

that seemed to have gathered black forests of hair at the expense of his crown, which was of the shiny bald order, indicated a vein of Saxon blood in some progenitor, although his accent and fluency in Gaelic proved that he was a native of the west. Under the chair of the piper, Fingal the piper's collie, almost as excitable as his master, lay asleep; and in a corner by the game-keeper's gun, Jet, Donald's placid pointer, lay stretched at full length. Betty laid down her knitting in some trepidation when the argument reached this point, and came in to see if she could not pour oil on the troubled waters. She found the piper on his feet with his bagpipes under his arm, evidently much offended, looking about in the dark for his bonnet.

'It iss anither gless o' whusky ye'll pe taking now, Mr Cameron, pefore ye tak' the road this could nicht?'

'And it iss verra pad whusky ye hef peen giving us the nicht, Mrs MacDonald, eneuch to tak' the temper away from any man,' said the piper in his severest tones.

'And ye are quite richt there, Mr Cameron,' said Betty timidly, willing to appease her guest at the expense of her own reputation; 'and it iss myself that iss glad ye mentioned it; for I had to offer ye some o' the Cawn'lton-still the nicht, cass the gentry when they wass on the moor yesterday shooting took every drop o' the rale heather-watter away in their flasks, and left no a drop wi' me. But I'm sure, Mr Cameron, ye'll no pe so angry wi' me as that comes to as to go away angry like that.'

'The whusky iss cood eneuch, if taken wi' a thankful spirit, Mrs MacDonald,' said Mr MacTavish. 'But when a man iss prood and stuck-up cass he has travellet at the heels o' his betters—but the Teuk's dog has done as muckle—while his own neibors have bided at home, he thinks maype that naepody kens the tifference atween a reel and a hornpipe but himself! Gif me another gless, Mrs MacDonald.—Cood-nicht, John; I drink to your petter manners.'

John was at the door, having found his bonnet, but came back to say, shaking his fist in Donald's face: 'It iss an ignorant prute ye are, Tonald MacTavish, and I scorn to pit my fingers upon ye; but nae doot ye'll want me to bring my pipes to the clachan anither nicht; and nae doot your son Angus will pe wanting me to learn him to play the pipes too; and nae doot, when he comes for that purpose, he will look to have his crack wi' Maggie! Ye will live, Tonald, my man, to ken it wass an ill nicht when ye thoct fit to drink to *my* petter manners!'

With which flourish, wound up by an emphatic and defiant snap of the piper's fore-finger and thumb in close proximity to the nose of the calmer game-keeper, the piper marched with what dignity he could muster, seeing that he carried half a pint of fierce whisky beneath his belt, from the clachan to the pathway across the moor, homewards; and so absorbed was he in cherishing his anger, that he would not indulge himself on his solitary way with one of his favourite Jacobite lilt, lest the sound of the pipes might charm away his wrath. And his collie Fingal followed sadly at his heels.

The game-keeper sat for only a short time after his friend was gone; he gave utterance to a low hard

laugh as the piper disappeared, and then relapsed into sulky silence. Presently he said, rising to leave: 'I'd petter pay ye for my share o' the whusky, Mrs MacTonalld.'

'Na; that can remain. Ye will pe here the day after to-morrow or so, I daresay, to make it up.'

'Take the money,' said Mr MacTavish firmly; 'he will peg my pardon pefore I drink another drop in his company.'

'A bad job!' said poor Betty, with tears in her eyes, as she slowly counted out to him the change.

On the afternoon of the same day, Maggie Cameron the piper's daughter was in her father's dairy busily at work. The piper's cottage and small farm-steading stood white and solitary at the mouth of Glen Heath, barely half a mile from Inversnow. The score of sheep that strayed about the glen with the red mark J. C. branded on their woolly sides belonged to the piper; so also did the three or four cows that stood cooling their feet in the heat of the day, in the peat-brown burn that coursed through the heart of the glen past the piper's fields and garden, to the loch. He was in a moderate way a prosperous man, and after the manner of men conscious of a bigger balance than their neighbours at the local bank, he thought he had a right to dogmatise on occasions. Folks who knew the piper knew that whoever ultimately was lucky enough to win the hand of his only daughter Maggie, would not take her dowerless; and that the dower would be something by no means to be sneezed at, was evident when the Inversnow intellect began to reckon on its finger-ends the various sources of the piper's income. There was first and foremost the farm; the piper's crops were ever the earliest and the heaviest; his mutton was always prime, and the piper knew well when and to what market to send. Nor on the Duke's whole estate were better turnips grown. Then what milk was to be compared to that which came from the piper's byre; and as for the piper's butter—churned by Maggie's own pretty hands—why, better butter was not to be had in or out of the parish for love or money. Besides which, the piper's white cottage, built on the slope facing the loch on one side and looking towards the glen on the other, within a few minutes' walk of the best scenery, the best shooting, and the best fishing in South-western Scotland, fetched—well, Inversnow did not know how much per month. Let to the 'gentry' during spring, summer, and autumn of every year, it was in itself another tap of gold flowing into the piper's pockets.

For several months in each year the Duke entertained guests at Inversnow Castle; and it was the piper's duty, as it was his pleasure, to march daily (Sundays excepted, and he grudged Sundays) for two hours to and fro in the hall of the castle while the Duke and his guests dined, the sonorous bagpipes discoursing appetising and digestatory music; and he was indeed a mean or thoughtless guest who departed without remembering the piper in some shape tangible to the piper. Dearly he loved his money. Nor was he a man likely to let money readily slip from his grasp when he once fingered it, and no man in Inversnow was more fertile in resources for adding to his store. But dearly as he loved gold, dearly as he loved his sheep, his cattle, and horses, his dram and his bagpipes, his

one primary treasure was his winsome daughter Maggie. Rough he might be, but beneath the hard shell was a true human heart that beat warmly and tenderly towards her.

Maggie stood, as has been said, busily at work on the clean paved floor of the dairy, her burnished milk-pans full of creamy richness, arranged on shelves along the walls. The dairy was cool and shady, and the sweet fragrance of the fresh milk mingled sweetly with odour of late honeysuckles and fuchsias clambering in at the window. Between the leaves of honeysuckle there was to be seen from the window, far off across the sloping fields, a peep of the loch, the blue sky, and the heather-clad hills in the distance. The door was open, and the afternoon light fell upon no more pleasant sight than the bright shapely Highland lassie, whose sleeves were tucked up to the elbow, her dress pinned behind, while her hands were deftly shaping butter with the aid of a pair of wooden 'clatters' into tempting rounded pats, each pat being dropped, by a quick graceful turn of her skilful hands, into a dish of clear spring-water beside her. Maggie hummed in a sweet low treble as she worked, an old Gaelic air that had a touch of melancholy in it, her sole audience the piper's monstrous bull-dog, that lay all her length in the sunshine asleep on the threshold. Presently the formidable-looking animal raised her head, pricked her ears and growled; then, at the sound of footsteps, rose and bounded down the path; and Maggie, as she paused in singing, heard a well-known voice cry: 'Down, Diana; down, I tell ye; keep down!' The Highland girl went on with her work, with perhaps a tinge of crimson shewing through the sun-browned face, while a man's voice rang out 'Maggie!' from the kitchen door, and then the steps turned to the open dairy door.

'Well, Angus,' Maggie said in a tone of surprise that was hardly meant to be taken as real; 'and iss it you again? I thought you said yesterday that the yacht was going to meet some of the castle-folks at Sheepfell?'

'The Teuk changed his mind, or had a telegram or something. But are ye not glad to see me, Maggie, that ye won't shake hands wi' a body?'

'Deed and I am fery glad to see yourself, Angus, and well ye ken that; but my hands are wet wi' the watter and the butter; and indeed ye must excuse me.'

'But it iss a cold greeting to gif a body, that iss what it iss, no to shake a hand, Maggie,' said Angus; 'or maybe,' plucking up courage from the laughter in Maggie's eyes and the pose of Maggie's cheek, 'maybe that iss what you wanted!' And Angus boldly bestowed a kiss upon the girl's cheek.

'Oh, Angus MacTavish, and how could ye do the like o' that, when ye see I could not protect myself wi' my hands among the butter?'

'Then gif it to me back again, as the song says,' said Angus, taking his own again, before Maggie could make any show of resistance.

'But it iss a wild fellow ye are, and no deserving this drink o' new-drawn warm milk I am going to give ye!'

Maggie wiped her hands in the long white apron she wore, and turned to fill a tumbler full of milk from one of the pans.

'Well, Maggie Cameron, it iss maybe more than

I deserve,' said Angus, as he took the tumbler from her hand and raised it to his mouth; 'but here iss to your ferry good-health, Maggie!'

'I believe ye would rather it had been a dram,' said the girl, as she watched the milk swiftly disappear down the young sailor's throat. But Angus declared that in saying so she libelled him.

'And now, Maggie, ye must put on your hat and come with me,' said Angus seriously, when he had emptied the tumbler.

'Go with you, Angus! You're joking. Wass it not for your lesson on the pipes ye came? But dad iss not at home this afternoon—he went the clachan-way with your father—but he will be disappointed to hef missed you.'

'I want you to come to the shore with me, Maggie; I have something to shew you, and I will take no denial for this once.'

'To shew me, Angus? But dad might not be pleased, if he came home when I wass out, to find I wass away trifling with you on the shore.'

'I will answer for that, Maggie Cameron.'

'Well, it iss true my churning is over, and the baking o' the scones can be done when I get back, but'—The maiden hesitated.

'But there'—and Angus lifted the dish of butter-pats and marched off with them, followed by Maggie, to the kitchen. 'Now put on your hat and come with me.'

While Maggie went to her room, Angus turned the key in the dairy-door, and hung it on a nail in the kitchen; and leaving Janet the maid to bring in the cattle and milk them, the couple started on their expedition with light hearts.

They were a winsome couple, and Janet—a goodly lass herself—stood admiring them from the door-step, not without certain longings on her own account, as they walked along the pathway that skirted the meadow, to the bridge at the gate; and from thence over the stile and across a field, towards the loch. Margaret Cameron was a tall well-built girl, yet her head was just on a level with her companion's shoulder. Her face was fresh and sunny, light and shadow playing on it in quick responsive movement to the mental mood that happened to rule her. She was young, not yet out of her teens, full of youthful impulse, that expressed itself in frequent peals of merry laughter easily roused; with a tender heart too, as the sweet blue eyes told, by the quick rush of tears when she was moved by any tale of woe, or touched by the chill finger of disappointment. Angus was a broad-shouldered six-foot sailor, stooping slightly as he walked, with a bronzed cheery face, and the kindest of honest eyes, that looked you straight in the face fearlessly. He had been for many years one of the most trustworthy 'hands' on board the Duke's yacht, *The Curlew*, and was looked up to by the fishing-folks of Inversnow with all the respect due to a favourite of the Chief's, and to one whose ideas had been expanded by frequent visits to the Mediterranean.

'Where are ye going?' asked the girl by-and-by, as Angus struck into a road leading to the town. 'It iss nefer into Inversnow we are going like this together!'

'And are ye ashamed to be seen walking with me, Maggie Cameron?'

'Ashamed? No! But it iss not well to be having folk talking idle gossip apout us in the daytime, when maybe I ought to be at home

working.' Maggie was made the more jealous of her reputation as a good housekeeper, by receiving a surprised nod at that moment from Mr M'Alister the grocer, who stood lazily on the door-step of his shop.

'Nefer mind what folk say, Maggie. This iss the way;' and Angus turned off the main street to the pier.

'Eh, Angus, what a pretty little poat—what a fery pretty poat!' said Maggie as they reached the end of the pier and looked down on a tiny boat resting placidly on the loch.

'And ye think her a pretty poat now, do ye, Maggie?' looking proudly from his achievement to his companion's interested face.

'I nefer saw anything prettier. She sits on the water like a sea-gull,' replied the girl warmly.

'And you can read her name on the stern now, can't you, Maggie—eh?'

The maid looked down fixedly and, as she looked, changed colour. Angus was watching her with beaming eyes. Painted in distinct blue letters on an oak ground were the words, 'MAGGIE CAMERON —INVERSNOW.'

RAILWAY ACCIDENTS.

THE fact that during last year (1876) no fewer than 1215 persons were killed and 4724 injured upon the various railways of Great Britain, is sufficiently startling; for these numbers, we need hardly remind our readers, exceed those of the killed and wounded in many a great battle. The average number killed per annum during the last five years has been 1295, and of those injured 4333.

Fortunately, however, for the peace of mind of the average British passenger, these numbers are not quite so alarming as they at first sight appear. That this is so, we shall shew by an analysis of the causes which led last year to the above-mentioned losses. Of those killed, no fewer than 305 were trespassers upon railway lines; and between thirty and forty of these were trespassers with the deliberate intention of committing suicide. Again, more than one half of the total number of persons killed were railway servants; and the same class furnished no fewer than 2600 of the 4724 cases of injury recorded in the returns. From their own misconduct or want of caution, 101 passengers lost their lives, and 604 sustained injuries. Level crossings are each year a very fertile cause of accidents, and to them no fewer than fifty-nine of the deaths of 1876 must be apportioned. We come now, however, to that which is undoubtedly a fact of the utmost gravity, namely, that thirty-eight passengers were killed and 1279 injured from causes over which they had no control, upon the railways of Great Britain.

In 1874, a Royal Commission was issued at the request of parliament to inquire into the causes and cure of railway accidents in Great Britain. For two years and a half the Commissioners pursued their labours; and their Report now lies before us. From it we gather that the Commissioners examined several hundreds of witnesses,

including officers of the Board of Trade, general managers of railway companies, traffic managers, superintendents and assistant-superintendents of railways, inspectors and sub-inspectors of various classes, foremen of shunters, station-masters, engine-drivers, guards, brakemen, shunters, plate-layers, signalmen, pointsmen, boilermasters, porters, and clerks. The Commissioners likewise arranged for a most valuable series of practical experiments upon the merits of the various systems of applying brake-power to trains, to be performed before them upon a portion of the Midland Company's railway near Newark. Of the important results disclosed by the elaborate system of experiments thus performed we shall have something to say presently. In addition to all this, the Commissioners personally inspected railway premises and works in various places throughout the kingdom, and investigated upon their own behalf certain 'typical cases' of railway accidents. Whatever conclusions, therefore, they may have arrived at claim at least the respectful consideration of all interested—and who is not?—in the prevention of railway accidents.

Regret has, we observe, been freely expressed in certain quarters that the Commissioners have not seen fit to advise the establishment of a government department which should exercise a general control over the practical administration of British railways. To have done so would, however, the Commissioners say, not have been in their opinion 'either prudent or desirable.' A government authority placed in such a position would, they remark, 'be exposed to the danger either of appearing indirectly to guarantee work, appliances, and arrangements which might practically prove faulty or insufficient, or else of interfering with railway management to an extent which would soon alienate from it public sympathy and confidence, and thus destroy its moral influence, and with its capacity for usefulness.' Whilst, however, the Commissioners are thus strongly of opinion that any change which would relieve the railway companies from the responsibility which now rests upon them to provide for the safety of their traffic would be undesirable, they are nevertheless disposed to believe that legislation—by which the adoption of certain recognised improvements, and the construction of certain necessary works for the greater safety of the traffic, should be made compulsory upon the railway companies—would be a public gain. Amongst these improvements and necessary works are included by the Commissioners the compulsory adoption of the block and interlocking systems. The object of the block-system, we may here remark, is to preserve an arbitrary interval of space between all trains which are moving in the same direction upon the same line of rails. This is accomplished by dividing the line into sections; and not until a telegraphic message has been received announcing that a train has passed out of one section, is another permitted to enter that section. If properly carried out, this

would prevent the possibility of one train running into another from behind, which as we all know has been a frequent cause of accidents.

We are not quite certain whether the Commissioners have done well in advising that 'increased facilities be afforded to the public to obtain redress by cheap and summary process when trains are late.' In the first place the Commissioners have not attempted to define when a train shall be held to be unpunctual; that is, whether one or five or fifteen or fifty minutes is to be held to constitute unpunctuality; and also whether the distance which the train has run is, or is not, to be taken into account. If every passenger by the Flying Scotchman from Edinburgh to London is to have a right to an action against the railway companies, in the event of that train being, say five minutes late upon its long journey of four hundred miles, the prospect of litigation thereby opened is sufficient to appal the hearts of shareholders in the North British, North-Eastern, and Great Northern Railways, and to make glad those of lawyers. Moreover, the Commissioners do not attempt to define what they mean by 'a cheap and summary process' being afforded to passengers of bringing actions against railway companies. At present such actions are occasionally brought in the County Courts, and it would be difficult, we think, to imagine 'a cheaper or more summary process' than they already afford.

At present, as most of our readers are aware, every passenger train which runs a distance of twenty miles without stopping is bound to carry with it some means whereby passengers can communicate with the guard or engine-driver of the train. The Royal Commissioners, however, have resolved to recommend that every train which runs for even eight miles without stopping is to be provided with a means of communication between the passengers and the servants of the company. Why this limit of eight miles has been arbitrarily fixed upon can only be left to conjecture. If some simple method could be devised whereby a passenger could instantaneously communicate with the servants of the train, an important benefit would be secured; but so long as the railway companies continue to call a small cord hidden away somewhere or other *outside* of the carriages, 'a means of communication between passengers and the servants of the company,' we confess that we do not attach much practical importance to this last recommendation of the Royal Commissioners.

We have already mentioned that the Royal Commissioners caused an extensive series of experiments to be performed in their presence upon a portion of the Midland Company's system near Newark, in order to test the various methods which have been invented for applying continuous brake-power to trains. Before, however, the trials of the various continuous 'brakes' were made, trials of the amount of brake-power *usually* supplied to the trains of some of the chief railway companies in Great Britain were made. From

these experiments it appeared that with the amount of hand brake-power usually supplied, a train going at between forty-five and fifty miles an hour could not as a rule be brought to a full stop in much less than half a mile. During the trials at Newark, the merits of eight different kinds of 'continuous brakes' were tried; and 'amply proved the necessity for some greater control over fast passenger-trains than that hitherto provided in this country.' Speaking approximately indeed, it was shewn conclusively at these trials that a good continuous brake will reduce the stopping distances of fast trains to one-third of the distance within which they can be stopped by the present ordinary means. With regard to the effect upon passengers of any sudden stoppages by means of these continuous brakes, it is satisfactory to know that 'by none of the systems used in the trials could the brakes be applied too powerfully or too suddenly for the safety of the passengers.'

As the result of these Newark trials, the Royal Commissioners recommend that it should be made obligatory upon railway companies to provide every train with sufficient brake-power to bring it, at the highest speed at which it may be travelling and upon any gradients, to an absolute stop within five hundred yards. They also advise that a large proportion of the brake-power should be in the hands of the engine-driver. He is usually the man who first espies danger; and as when a train is travelling at the rate of sixty miles an hour, it passes over eighty-eight feet per second, it will easily be seen, that however slight may be the interval necessary for the driver to attract the attention of the guard, and for that official to apply his brakes, it may be sufficiently long to cause a serious accident.

Every newspaper reader must have remarked the frequent accidents which occur through passengers (whilst entering or leaving railway carriages) falling between the steps and the platform. This being so, it is satisfactory to remark that the Royal Commissioners have resolved to recommend that the adoption by railway companies of continuous foot-boards of sufficient width should be made compulsory wherever, in the opinion of the officials of the Board of Trade, 'the circumstances of the traffic are such as to render them necessary for the safety of passengers.'

As regards the important subject of the compensation which the railway companies are at present obliged to make whenever a passenger is—through no fault of his own—killed or injured whilst travelling upon their lines, the Royal Commissioners have not thought it necessary to make any special recommendations. They appear indeed to think that the principle of self-interest will be sufficient to make the companies introduce all reasonable improvements and take all possible means to secure the safety of their passengers. Mr Galt, however, one of the Royal Commissioners, dissents from this view of his colleagues, and we think with reason. He asks in connection with this subject the following very pertinent question: 'Does the sum paid in compensation by the companies exceed the expenditure that would necessarily be incurred for the avoidance of preventable accidents?' This question Mr Galt proceeds to regard from two points of view. First, the effect of accidents on the market value of railway shares; and second, the cost which the com-

panies would have to incur in order to introduce various well-known means for the prevention of accidents, which have often been pressed upon their attention by Captain Tyler and other officials of the Board of Trade. The effect of an accident upon the market value of railway shares, even when it is one of exceptional severity, Mr Galt shews is only temporarily and never permanently to lower the value of the shares in the particular railway company upon whose system it occurred. The first cost, moreover, of introducing improvements upon their lines, Mr Galt points out, is felt very severely by railway companies; whereas the compensation which they pay for personal injuries does not at present amount to one per cent. of their total expenditure. Mr Galt indeed asserts that the saving which the companies would effect by the use of every available means for the prevention of accidents would 'scarcely amount to a shilling in the hundred pounds.' Hence he arrives at the very disagreeable conclusion, that so far as the *pecuniary* principle—apart from all higher considerations—is concerned, the railway companies' interests and those of the general public are diametrically opposed to each other!

We shall conclude this article by giving a brief epitome of the principal points upon which the Royal Commissioners have made formal 'recommendations' either for the consideration of parliament or of the railway companies. 1. They have recommended that discretionary powers should be conferred upon the Board of Trade to enforce the extension of stations and sidings wherever the accommodation provided for the traffic is so inadequate as to endanger safety. 2. To enforce the adoption of the block and interlocking systems on all lines or portions of lines where the introduction of these improvements is necessary for the safety of the traffic. 3. To restrict the speed of trains upon any line or section of a line which is in a condition to render a high rate of speed unsafe. 4. To require companies to provide their passenger carriages with continuous foot-boards. 5. To impose conditions upon companies in certain cases in sanctioning the opening of new lines. 6. To require companies to provide foot-bridges or subways at stations where the absence of such accommodation is proved to be a source of danger. 7. To require a lodge to be maintained at public crossings for foot-passengers wherever circumstances render it necessary for safety. 8. That railway companies shall be required by law, under adequate penalties, to supply all trains with sufficient brake-power to stop them within five hundred yards under all circumstances. 9. That in order to produce greater punctuality in the conduct of the traffic on railways, additional facilities be afforded to the public for obtaining compensation when trains are late. 10. That the 31st and 32d Vict. c. 119, s. 22, relating to intercommunication in trains, be amended in the manner which we have indicated above. 11. That the civil liability of railway companies for accidents to their servants, and of the criminal liability of persons in railway employment for acts of negligence endangering life, be extended.

Some at least of these proposals of the Royal Commissioners will doubtless be adopted by Her Majesty's government, and will be proposed to parliament, with all the weight of their authority, during the next (1878) session of parliament.

That the government measure which will embody these 'selected' recommendations of the Royal Commissioners will satisfy all parties—directors of railways, railway servants, and the general public alike—would of course be too much to hope. But this may at least be confidently predicted—that if the chief recommendations of the Royal Commissioners be adopted by parliament, and be loyally carried out in practice by the railway companies, they will tend in no inconsiderable degree to render railway travelling in Great Britain in the future both much safer and much pleasanter than it has been in the past.

DROLLERIES OF THE AMERICAN BENCH.

DROLL things are reported of the bench and bar in the United States. Perhaps all that is said of them in the newspapers may have a tinge of exaggeration; but we do not doubt that there is a considerable substructure of truth. What, indeed, but odd sayings and doings can be expected from judges who are appointed by universal suffrage, and may in many cases be little better than the boon-companions of the culprits who are apt to come judicially before them. We call a few drolleries of the American bench for the amusement of our readers.

Wearied beyond endurance by the tediousness of a long-winded pleader, a Kentuckian judge put himself out of his misery and his tormentor out of countenance by suddenly exclaiming: 'If the court is right, and she thinks she air, why then you are wrong, and she knows you is. Shut up!' Almost as rude in speech was Judge Dowling, who after serving as fireman and police-officer, became by election one of the magistrates of the Empire City. 'What are you reading from, sir?' asked he of a counsel.

'From the statute of 1876, your Honour,' was the reply.

'Well,' said Dowling, 'you needn't read any more; I'm judge in this court, and my statutes are good enough law for anybody!'

This worshipful gentleman plumed himself upon deciding 'according to the equities of the case,' law and precedent to the contrary notwithstanding; they went for nothing with him.

They did not go for much more with the western administrator of the law, Judge Alec Smith. A divorce case being called on, he, addressing the plaintiff's representative, said: 'I don't think people ought to be compelled to live together when they don't want to do so. I will decree a divorce in this case;' and the parties concerned were thereupon declared to be no longer man and wife. Presently the defendant's lawyer appeared, and was not a little surprised to find all was settled, that the judge had decided without hearing one side, much less both. He protested against such over-hasty proceedings, and appealed to the court to redress the wrong it had committed. The court not being inclined to own itself in fault, he was informed it was too late to raise objections;

the decree had been pronounced; but if he wanted to argue the case 'right bad,' the court would marry the parties again, and let him have a crack for it.

When Miss Amelia Donnerschley claimed two hundred dollars from faithless Augustus Berker for breach of promise, the gentleman justified his conduct on the plea that after dwelling under the same roof with the young lady and her mamma for eight months, he found it so impossible to live comfortably with the one, that he was compelled to cry off with the other. The judge inquired if the mother purposed living with her daughter after marriage, and receiving an affirmative answer, asked the defendant whether he would rather live with his mother-in-law or pay two hundred dollars.

'Pay two hundred dollars,' was the prompt reply.

Said the judge: 'Young man, let me shake hands with you. There was a time in my life when I was in the same situation as you are in now. Had I possessed your firmness, I should have been spared twenty-five years of trouble. I had the alternative of marrying or paying a hundred and twenty-five dollars. Being poor, I married; and for twenty-five years have I regretted it. I am happy to meet with a man of your stamp. The plaintiff must pay ten dollars and costs for having thought of putting a gentleman under the dominion of a mother-in-law.'

The much-married dignitary was not so susceptible to the charms of the sex as his brother of Iowa, who refused to fine a man for kissing a girl against her will, because the complainant was so temptingly pretty that nothing but an overwhelming sense of its dignity prevented the court kissing her itself.

It is lucky for an offender when his judge puts himself in his place; justice is sure then to be tempered with mercy, as in the case of the snatcher of spoons brought before a Georgian court many years ago. Bela Brown, who then went the circuit as judge, was an able man, in equal repute as a lawyer and as a boon-companion. The night before the court was to open at Dayton, his Honour went to a tavern kept by Sterrit, and had such a good time of it with his legal friends that by midnight he was not quite so sober as a judge should be. Somebody cleared the table of all its spoons, and put them into the unconscious gentleman's pocket. He was greatly perturbed at finding them there next morning. They were Sterrit's spoons without doubt, for they bore the landlord's initials.

'Polly,' said the judge to his wife, 'was I tipsy when I came home?'

'Yes,' said she. 'You know your habits when you get among those lawyers.'

Much relieved in his mind, the judge declared he could understand how the spoons came into his possession. 'That fellow keeps the meanest liquor in the States; but I never supposed it would make a man steal.'

A day or two afterwards, a man was arraigned for larceny; he pleaded guilty, but urged he was intoxicated when he committed the offence.

'What's the nature of the charge?' inquired Judge Brown.

'Stealing money from the till at Sterrit's tavern,' replied the clerk.

'Young man,' said the judge solemnly, 'are you sure you were tipsy when you took this money?'

'Yes, your Honour; when I went outdoors the ground kept coming up and hitting me on the head.'

'That will do. Did you get all your liquor at Sterrit's?'

'Every drop, sir.'

Turning to the prosecuting attorney, the judge said: 'You will do me the favour of entering a *nolle prosequi*; that liquor of Sterrit's I have reason to know is enough to make a man do anything dirty. I got tipsy on it myself the other night, and stole all his spoons. If Sterrit will sell such abominable stuff he ought not to have the protection of this court.—Mr Sheriff, you may release the prisoner.'

Like the sailor who objected to his captain preaching and flogging too, offenders generally do not appreciate being suitably admonished as well as punished; and no doubt the Californian felt annoyed when, through incautiously demurring to the magistrate reproaching him with having no ambition, he found himself put to the question with: 'Where is it, sir? Where is it? Did you ever hear of Cicero taking free lunches? Did you ever hear that Plato gambled through the alleys of Athens? Did you ever hear Demosthenes accused of sleeping under a coal-shed? If you would be a Plato, there would be a fire in your eye; your hair would have an intellectual cut; you'd step into a clean shirt; and you'd hire a mowing-machine to pare those finger-nails. You have got to go up for four months!'

The Honourable Kiah Rodgers, commonly called Old Kye, presiding in a Louisiana court, thus spoke his mind to a delinquent named Kettles: 'Prisoner, stand up! Mr Kettles, this court is under the painful necessity of passing sentence of the law upon you. This court has no doubt, Mr Kettles, but what you were brought into this scrape by the use of intoxicating liquors. The friends of this court all know that if there is any vice this court abhors it is intoxication. When this court was a young man, Mr Kettles, it was considerably inclined to drink, and the friends of this court know "at this court has naterally a very high te"; and if this court had not stopped short of, I have no doubt, sir, but what this court, sir, would have been in the Penitentiary or in its grave.'

Still more communicative was Judge Kye respecting his young days when summing up in an action brought by an overseer for wrongful dismissal from his situation.

'The jury,' said his Honour, 'will take notice that this court is well acquainted with the nature of the case. When this court first started in the world it followed the business of overseeing, and if there is any business which this court understands, it's hosses, mules, and niggers; though this court never overseed in its life for less than eight hundred dollars. And this court in hoss-racing was always naterally gifted; and this court in running a quarter race whar the hosses was turned, could allers turn a hoss so as to gain fifteen feet in a race; and on a certain occasion it was one of the conditions of the race that Kye Rodgers shouldn't turn narry of the hosses.' Surely it must have been Old Kye who upon taking his

official seat for the first time, said: 'If this court know her duty, and she thinks she do, Justice will walk over this track with her head and tail up.'

Prone as he might be to discursiveness, we fancy the Louisiana judge would have laid down the law a little more lucidly than the worthy to whom a Minnesota jurymen appealed for aid, when his ideas as to what constituted murder had been confused by the arguments of counsel.

'Gentlemen of the jury,' said this legal luminary, 'murder is where a man is murderously killed. The killer in such a case is a murderer. Now murder by poison is just as much murder as murder with a gun, pistol, or knife. It is the simple act of murdering that constitutes murder in the eye of the law. Don't let the ideas of murder and manslaughter confound you. Murder is one thing, manslaughter is quite another. Consequently, if there has been a murder, and it is not manslaughter, then it must be murder. Don't let this point escape you. Self-murder has nothing to do with this case. According to Blackstone and all the best living writers, one man cannot commit *felo de se* upon another; and that is clearly my view. Gentlemen, murder is murder. The murder of a brother is called fratricide; the murder of a father is called parricide, but that don't enter into this case. This case is murder, and as I said before, murder is most emphatically murder. You will take the case, gentlemen, and make up your minds according to the law and the evidence, not forgetting the explanation I have given you.'

When an English judge has passed sentence upon a criminal, he has done with him. It would never enter his head to visit a man he had condemned to death. Judge Smith of Cincinnati had different notions of judicial etiquette. One Samuel Covert, about to be executed at Lebanon, had just taken his last meal, when the judge looked in, inquired how he felt, and asked for his autograph. Having obtained the autograph, and learned that Covert was pretty well, considering circumstances, the judge shook his hand warmly, saying: 'Good-bye, Mr Covert; I shall not see you again.'

'Good-bye, Mr Smith,' was the reply. 'Remember my last words to you: you have passed sentence of death upon an innocent man.'

'That is so, is it, Sam?' queried the visitor.

'Yes, sir.'

'If that be true, you've nothing against me; have you, Sam?'

'No, sir; you did your duty under the evidence.'

'Well, Sam, if you are an innocent man, it is a great calamity.'

'I am innocent,' repeated Covert.

The judge then departed, and Covert was marched to the scaffold.

Judge Smith hardly felt so easy in his mind as a Californian sheriff did after being interviewed by a self-confessed murderer, who desired to be sent to New York to answer for the crime he had committed in that city.

'So your conscience ain't easy, and you want to be hanged?' said the sheriff. 'Well, my friend, the county treasury ain't well fixed at present, and I don't want to take any risks, in case you're not the man, and are just fishing for a free ride. Besides, those New York courts can't be trusted to hang a man. As you say, you deserve to be killed, and your conscience won't be easy till you are killed, and as it can't make any differ-

ence to you or to society *how* you are killed, I guess I'll do the job myself!' and his hand moved to his pocket; but before he could pull out the revolver and level it at the murderer, that conscience-stricken individual was down the road and out of killing distance.

When lawyers behave in such a free-and-easy way, it is not surprising that a prisoner presumes to enter into familiar conversation with the bench. 'An old tippler,' asked by a Nevadan court whether he was rightly or wrongly charged with being intoxicated, pleaded, 'Not guilty, your Honour. Sunstroke!'

'Sunstroke?' queried Judge Cox.

'Yes, sir; the regular New York variety.'

'You've had sunstroke a good deal in your time, I believe?'

'Yes, your Honour; but this last attack was most severe.'

'Does sunstroke make you rush through the streets offering to fight the town?'

'That's the effect precisely.'

'And makes you throw brickbats at people?'

'That's it, judge. I see you understand the symptoms; and agree with the best recognised authorities, who hold it inflames the organs of combativeness and destructiveness. When a man of my temperament gets a good square sunstroke he's liable to do almost anything.'

'Yes; you are quite right—liable to go to jail for fifteen days. You'll go down with the policeman at once.' With that observation the conversation naturally closed, and the victim of so-called sunstroke 'went down.'

The bench does not always come off so victoriously. A prisoner before the court of Keatingville, Montana, neglecting to remove his hat, the sheriff was directed to do it for him, and obeyed instructions by knocking the offending head-gear off with his rifle. The owner picked it up, and as he clapped it on his head again shouted: 'I am bald, judge!' A repetition of the performance followed; at which, waxing indignant, his Honour rose and said: 'I fine you five dollars for contempt of court—to be committed until the fine is paid!'

The offender walked up to the judge, and laying down half a dollar, remarked: 'Your sentence, judge, is most ungentlemanly; but the law is imperative, and I will have to stand it; so here is half a dollar; and the four dollars and a half you owed me when we stopped playing poker this morning, makes us square!'

The card-playing administrator of justice must have felt as small as his brother-judge when he priced the cow. Being at Little Rock, Arkansas, on business, that judge strolled into the market, and seeing a farmer with a cow, stepped up to him and asked what he wanted for her. 'Thirty dollars,' said the farmer. 'She'll give you five quarts of milk if you feed her well.'

'Why,' quoth the judge, 'I have cows on my farm, not much more than half as big as yours, which give twenty quarts a day.'

The cow-owner eyed his new acquaintance very hard, as if trying to remember if he had seen him before, and then inquired where he lived. 'My home is in Iowa,' was the reply.

'Yes, stranger,' said the farmer, 'I don't dispute it. There were heaps of soldiers from Iowa down here during the war, and they were the worst liars

in the whole Yankee army. Maybe you may have been an officer in some of them regiments?'

Without satisfying his interlocutor's curiosity on that point, the judge, we are told, 'slid for the court-house.'

THE FAIRIES.

WHERE are the wonderful elves, and the fairy creatures bright?

Where are the tiny things that danced in the pale moonlight?

Danced in a magic ring, and fluttered in robes of white,
Like notes in the sunbeam whirled, like leaves in the forest hoar.

Hark to the sound of the sea, and the cry of the waves on the shore.

Where are the dusky gnomes who toiled in the golden ground?

So that the miners trembled hearing their hammers' sound,

Hearing them tapping, tapping, delving in darkness bound,

A thousand tapping hammers, beneath them hammering.

Hark to the muttered thunder, the voice of the hidden spring.

Where are the forest fairies, the elves in Lincoln green,
Deep in the forest hidden, and never in cities seen,
Sought for by timid maidens, on sainted Hallowe'en,
The joy of all true lovers, a merry band were they!

Hark to the hum of the bee, in the scented blooms of May.

Where are the household fairies, who loved the embers' glow,

Who played at games with the shadows flickering to and fro,

But left no track on the sandal floor, no trace on the fallen snow,

And filled up the little slippers the children left behind,
Hark to the howl of the tempest, the moan of the stormy wind.

The elves are waiting, waiting, for the golden days to come,

When grief shall be known no longer, nor faithful love be dumb;

Till the figures all are added up, and finished the mighty sum.

Ah yes, they are waiting, waiting, till grief shall be no more.

Hark to the rustle of raindrops, that kiss the deserted shore.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.

3d. Manuscripts should bear the author's full CHRISTIAN name, surname, and address, legibly written.

4th. MS. should be written on one side of the leaf only.

5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

SEVENTY YEARS SINCE.

THE last representatives of our grandfather's generation having passed away, there is no reason why the following true stories of an old Scotch house should not be made public, for the entertainment of others besides those members of the family to whom only they have hitherto been known. I have slightly changed the names of persons and places, but not a detail of the stories has otherwise been altered from the first-hand accounts given us by those who were themselves their heroes and heroines.

On a winter's afternoon in the year 1816 three young officers were riding 'within a mile of Edinboro' town;' they were pushing on in advance of their regiment, which was that day marching into new quarters, hoping to reach the city in time to choose lodgings for themselves, to whom rooms in barracks had not been allotted. Suddenly a gaunt gipsy woman of the Meg Merrilies type darted out upon them, and laid her detaining hand upon the bridle of Lieutenant T—— (my grandfather). He tried to shake his rein free, but without effect, and the little cavalcade was brought to a halt by her persistence; then addressing the gentlemen collectively, but keeping her eyes upon my grandfather, she offered to tell their fortunes. The young men laughed at the suggestion, and the gipsy wife waxed angry. 'Ye'll do little good in Edinboro' or elsewhere,' she retorted roughly to the two captains who had declined her services. 'But for ye' (speaking only to Lieutenant T——), 'there's a bonnie bride waiting in the first house ye enter!'

My grandfather threw her a shilling and galloped on with his companions, enduring for some time their good-natured raillery about the spae-wife's prediction; but when they reached the city they were too much engaged in observing the outsides of the houses which might afford them the desired lodgings, to think further of the prophecy. In the dim light, one large house with closed shutters looked as if it were untenanted and likely to suit their requirements; while a light from a lower

kitchen window shewed that some one was left in charge who could attend to Lieutenant T——'s loud summons at the knocker. But the young man, accounted a gallant soldier enough, who had seen some service in the late wars, was entirely routed and discomfited by the furious reception his modest inquiry after lodgings met with from the stalwart maid-servant who answered the door. 'Lodgings! What was the world coming to when a daft young fool asked if her mistress let lodgings? The family was away in the north, and this would be a pretty tale to tell them on their return,' stormed the cross maid; and my grandfather, leaving a torrent of rough language behind him, made his escape down the steps of the house over whose threshold he had so mistakenly intruded. He remounted his horse amid the jeers of his two friends, who reminded him of his fate predicted by the gipsy, and begged him, if this were a sample of the 'bonnie bride's' usual temper, to exchange into another regiment as soon as he married. Eventually the young men found rooms to suit them, and in a few days became quite at home in the pleasant capital of the north, which was just beginning its gay winter season.

About a week after their arrival the officers were present at an Assembly ball, and Lieutenant T—— lost his heart at first sight to a lovely young *débutante* of fifteen, with whom he danced the whole evening. At the close of the ball he was introduced to a grand turbaned lady, his partner's mother; and on seeing the ladies to their carriage he asked leave to do himself the honour of calling for them next day. This permission and their address were given him, and the latter noted in his pocket-book. The next morning he eagerly sought out their house, which he did not recognise as the scene of his first adventure till Ailie, the same stalwart maid, opened the door, and this time admitted him graciously.

This visit was followed by many others; and before a year had passed my grandfather won the 'bonnie bride' of the spae-wife's prediction from the very house across whose threshold he had first set foot on entering Edinburgh. They were a very

young pair; he only twenty-one and my grandmother just sixteen at their marriage; and how their housekeeping might have prospered or the reverse I do not know, had not Ailie decided to take service with the young couple, and maintained their interests during the wanderings of the next thirty years as faithfully as she had previously guarded the honour of her mistress's house. She was one of the now extinct race of family servants, a sort of factotum in the house, where she did her own work and a good part of every one else's in a wonderfully indefatigable fashion, only reserving to herself the privilege of keeping every one in order, from the master and mistress down to the kitchen wench.

To three out of the four generations of our family whom she served, she was 'old Ailie'; and her flowered chintz bedgown and mob-cap survived unaltered far into the era of crinoline and chignon. What stories she had to tell of Madam our great-grandmother, a very grand dame indeed, and well-known card-player; and of a certain Mistress Jean, her favourite heroine, whom some of us recollect as Aunt Moir, a little soft-faced, pink-and-white lady, not so imposing to look upon as the miniature of her powdered mamma, but a beauty nevertheless in her day. She lived at a time when it was the acknowledged fate of all Edinburgh belles to fall a prey to dyspeptic old East Indians, who having been drafted off as raw lads to India, were heard of no more till they returned as nabobs half a century later, to take their pick of the blooming lassies for whom the Scottish capital has ever been justly celebrated.

Aunt Moir would describe how she and her mother went every Sabbath morning to 'sit under' Dr M——; and how, as they mounted the high steps to the entrance of the place of worship, the beaus young and old—some in blue swallow-tailed coats buttoned tight across the chest, and frilled *jabots* like protruding fins; others with military pig-tails and riding-boots—stood on each side of the door and criticised their figures (a lady's face in those days being pretty well hidden by her telescopic bonnet), and more particularly their feet and ankles, incased in sandalled shoes and silk stockings. Aunt Moir admitted that her feet passed their examination creditably enough, though the criticism was sometimes more severe than gallant; and one of her young-lady friends went by the name of 'Flat-foot Meg.' But Aunt Jean's were evidently of a different order, and were swift and light enough to do even more than please the fastidious taste of the Edinburgh bucks. 'Some years after her marriage with an old and invalid husband, who had carried her away from Edinburgh to a country home, Mistress Moir, little more than a girl still, one day going over her domains started a hare from a barley-stook, and throwing all her matronly dignity to the winds, she pursued Puss through a couple of meadows, and eventually captured and brought him struggling to the house. Whether she kept

maukin as a pet and proof of her agility, or converted him into the excellent soup for which she has left us her recipe, labelled in a pointed Italian hand-writing 'Mistress Moir's Hare Broth,' history does not relate. Let us hope the former fate was his, for the recipe says in conclusion, 'Without the meat of two hares is the broth poor and meagre.'

Aunt Moir had no children of her own; but her heart and home were always open to the numerous members of the T—— family, her nephews and nieces. She found queer old ornaments, Indian beads and tartan scarfs, in her store-boxes for the girls; and the town-bred boys found rare opportunities for healthful delightful mischief when the High School released them for their holidays at Moir. One species of entertainment was specially sacred to Aunt Jean's kail-yard: to mount astride upon tall, well-grown, firm-hearted cabbages, and rock gently to and fro, with short leather-breeched, gray-stockinged legs sticking out straight like a cavalry officer's, until a warning crack in the stalk, or the sudden appearance of Aunt Jean's Tam rushing round some unexpected corner, with his climax of threats: 'I'll tell Mistress Alice,' drove the boys from their position.

A gray-headed, cross-grained old fellow was Tam, affecting to disapprove highly of the annual summer incursion of boys and girls into the Moir fruit-gardens, trampling among his strawberries that were destined for Mistress Jean's preserves, and rifling his bushes for 'honeyblobs.' But he had a soft spot in his heart for my mother, Anna T——, who reminded him, he fancied, of his little daughter Kirsty, dead thirty years before; and many a Sunday afternoon did Tam give mother a helping hand through her portion of the Shorter Catechism, imposed as a becoming exercise for the mind by Aunt Moir on each of the children. Tam was a rigid Sabbatarian of course, and even his favourite Anna was not exempted from blame when one Sabbath evening the whole young party were discovered in pursuit of a marauding rabbit who had for days past ravaged their gardens. Ananias and Sapphira, Korah, Dathan, and Abiram were somewhat irrelevantly cited as cases in point, or at least as fellow-sinners; but he ended by muttering to himself, as he left the abashed T—— children to meditate over his sermon: 'An' the Lord spare me till the morn's morn, I'll shoot that deil mysel.'

Tam had been with Aunt Moir's parents at Port-corry before they migrated southwards to Edinburgh, to settle the boys in life and the girls in marriage. She had a queer story to tell us of her childhood connected with Tam's wife Kirsty, who lived as nursery-maid in her father's house, and had somewhat indifferently, and in the spirit of the lass who sang,

If it's ordained I maun tak him,
Wha will I get but Tam Glen?

married Tam the 'gairdner lad,' and retired with

him to the lodge. When her little Kirsty was born, however, she gladly accepted the post of wet-nurse to the contemporaneous baby just arrived at the house, and returned to her old position in the nursery, bringing all her newly awakened maternal love, as well as her boundless devotion and respect for 'the family,' to lavish upon little weakly Uncle Donald. Baby Kirsty at the lodge flourished upon oatmeal porridge administered by Tam's clumsy hands, and was soon 'creeping' about everywhere with the big collie dog as her sole attendant; while up at the house Master Donald took all the devotion of two mothers to rear him, and was all-sufficient to Mrs Kirsty, who forgot husband, child, and home in her tendance of her foster-son.

At last, almost a year afterwards, the boy being weaned and fairly strong, it was thought time to dismiss the foster-mother to her home duties; and accordingly, after a violent and distressing parting, she tore herself away from the child and returned to the lodge for good. That same night Aunt Jean, a child of nine, who slept in the same room occupied by the head-nurse and the baby brother, woke suddenly without any particular reason, and saw by the dim light of the nursery lamp, Kirsty's well-known figure walking to and fro through the room with the little white bundle of a Donald in her arms. Presently she laid the quieted child down in his cot again; and then catching the wide-open eyes in the next bed, she made a sign to be silent, turning her head in the direction of the sleeping head-nurse. Aunt Jean, well aware of various little nursery jealousies between Mrs Macnab and Mrs Kirsty, gave a nod of acquiescence, and lay quite still, watching Kirsty as she softly bent over the little boy, settled him comfortably, and kissed him again and again. She was still there hovering round the cot with noiseless footsteps when the little girl fell asleep again.

Next morning, the first news that came to the house was that poor Mistress Kirsty had died suddenly in the night in her own bed of a sudden attack of heart complaint; brought on, the doctor said, by the excessive grief to which she gave way on parting from her adopted son. Tam and little Kirsty did not miss her much, I believe; nor, sad to say, did the little lad for whom she had spent her strength so willingly; but Aunt Jean held persistently to her story of the 'vision'; and the tale of 'faithful Kirsty' is still a beloved tradition in our nursery. Thanks to her care, Uncle Donald grew up a strapping lad, and when only fifteen served at the battle of Waterloo, and was present at the entry of the allied powers into Paris. There is still extant a funny etching, executed by some wit of the regiment, in which Ensign Donald is represented 'looting' a confectioner's shop, with drawn sword in one hand and immense half-demolished *brûlée* in the other; the young ladies of the counter, attired in the classical costumes of the First Empire, flying every way from the onslaught of this hero from the Land o' Cakes.

They were a kindly race these Scotch relations of ours; less extravagant in their habits, customs, and ways of thought than their descendants of the present generation; handsomer and healthier too, perhaps, if we judge from the bright eyes and rosy smiling faces of the portraits they have left us; though even in these degenerate days, a return to the early hours, simple habits, and oatmeal por-

ridge of the last century might yet make our lads and lassies, who inherit the friendly Scottish nature, as handsome, healthy, and happy as their grandfathers and grandmothers were seventy years since.

THE LAST OF THE HADDONS.

CHAPTER XXIX.—PHILIP AND ROBERT.

WE found Robert Wentworth with Mrs Tipper, and he too, I saw, very curiously examined Philip as they were introduced to each other. Each eyed the other curiously and critically for a moment or two, as they uttered the first few words; and I think each was as favourably impressed towards the other as I could desire them to be. They were kindred spirits, and soon recognised that they were, making acquaintance in easy, undemonstrative, manly fashion.

Robert Wentworth was like an elder brother of Philip's, and there was just sufficient difference between their minds to give a zest to their companionship. Philip's was a more mercurial temperament; whilst there was a vein of satire in the other, lacking in him. Lilian thought that Robert Wentworth had not the same poetical perception which Philip possessed; but that did not I, for whom the former had unfolded the hidden meaning, the subtle essence of some of the poet's most delicate imagery. Of course I could not suppose Robert Wentworth to be Philip's superior; but neither would I do him the injustice of calling him inferior. They were different.

One thing puzzled me not a little as time went on. Whether it was that my love for Philip made me shyer and more reticent with him, or whether he did not look for certain things in me, I know not; but one part of my mind, which was as an open book to Robert Wentworth, remained undiscovered and even unsuspected by my lover. Once when Philip made a little jest about Lilian's romance and enthusiasm, Robert Wentworth smilingly opined that there were graver offenders in that way than Lilian; but I knew that I was the only one to perceive his meaning. If Philip had any suspicion that the allusion was intended for me, he did not perceive its application. Would it have made any difference if I had been able to let my thoughts flow into words when alone with him? When I was his wife—when this foolish shyness, reticence, or whatever it might be, was once overcome—I knew that he would find me a much more attractive companion than now. But while I longed to give more expression to my feelings, I nervously shrank from doing so. I almost wished that he would *force* me to shew my thoughts, as Robert Wentworth used to take so much delight in doing.

What girl could love as I did? What love could be deeper and more intense than mine? Yet the consciousness that I was *not* a girl kept me silent whilst my soul vibrated to every look and word of his. Ah me—ah Philip! would it have been wiser to let you see? That night when we stood together in the moonlight—when you good-naturedly jested me about my matter-of-fact way of regarding things—would it have been better to let you see the volcano hidden beneath the snow? Ah Philip, when you feared I had caught a chill, and wrapped my shawl closer about me, would it have

been wiser to let you know *why* I was trembling beneath your touch?

I have learned to say: 'No; better as it was.'

But I have been anticipating. This first evening of the meeting between Robert Wentworth and Philip, all was *couleur de rose*, and my mind was at rest. I sat more silent than usual, congratulating myself upon the prospect of the great desire of my heart being gratified. They two would be friends, even according to my somewhat *exigeante* notion of what friendship should be. Then it was pleasant to listen to Robert Wentworth's few words respecting his appreciation of Philip, so honestly and heartily spoken.

'You must not forget that it is a brother's right to give you away, when the time for giving away comes, Mary,' he said gently, as he and I stood together by the open window a few minutes, whilst Philip was turning over the music for Lillian, who was singing some of his favourite airs for him.

'Will you? It is kind to wish it,' I murmured, feeling that it was a great deal more than kind.

'Mr Dallas is, I believe, worthy of any man's sister, Mary.'

'I am glad you think so'—I paused a moment, then, as a sister should, added—'Robert.'

He smiled, and talked pleasantly on, contriving to set me quite at ease respecting the state of his own mind. I was now able to persuade myself that he had been deceived, and that his friendship for me had never really developed into a stronger feeling. Presently he said in his abrupt friendly fashion: 'Why do you not sing, Mary?'

'Oh, Lillian sings that so much better than I; and it is a favourite of Philip's.'

'Well, come now and enchant our ears,' going towards the piano as Lillian ceased, and looking out a song which he always said I sang well. 'Now, do your best.'

But although Philip and Lillian were more than satisfied, Robert was not. He and I knew that it was not my best, their kind speeches notwithstanding. He seemed to have quite changed his tactics with regard to me—doing everything in his power to make me appear to advantage in Philip's eyes. But he unconsciously deprived me of the pleasant termination of the day, which I had been looking forward to. Philip and he set forth together to walk to the railway station, and of course there was no moonlight walk for me that night.

But there was the morrow—many a happy morrow to come, now, I told myself, looking after them as they went down the lane together. The more they saw of each other, the sooner they would become friends. Lillian, who stood beside me at the gate, slipped her arm round my waist, and laid her head against my shoulder in eloquent silence.

It was fortunate that the day had come round for paying my promised visit to Nancy Dean. I felt that I needed some kind of reminder that I did not live in a world all flowers and sunshine. I set forth the next morning alone, thinking that Nancy might possibly feel less under constraint than if Lillian were present during our interview. Philip had some banking business to transact which would prevent his getting down to us until late in the afternoon; and I had therefore ample time for my errand before his arrival.

—This time I found no difficulty in obtaining

admittance; and was informed that the rules allowed me to remain an hour, if I chose so to do, with my friend Nancy Dean. That hour we were at liberty to spend in either the dining-hall or exercise-ground, as we chose. We gazed earnestly and curiously at each other as we shook hands; and I hope she was as pleased with me by daylight as I was with her.

Without being handsome or even pretty, Nancy Dean's was a face which pleased me much. If expressing a shade too much self-will and the firmness which, untrained, is so apt to degenerate into obstinacy, there was no trace of meanness, deceit, or dishonesty.

'You expected me to-day of course, Nancy?'

'I shouldn't be here if I hadn't, Miss,' she returned with a grave smile. We had elected to spend the hour in the open air; and with my arm linked in hers, we paced slowly up and down part of the old court-yard, or exercise-ground as it was called.

'In that case, I ought to be thankful that no accident occurred to prevent my coming. It might have, you know, and then poor I should have had to bear the blame for anything which followed.'

'How could you have been to blame if an accident had happened, Miss?'

'My dear Nancy, if you had fallen back, *some one* would have been in fault, since we could hardly throw the blame upon an accident.'

'You mean I should have been to blame, if I had gone wrong again because you did not come?'

I smiled. 'I am not altogether sure which of us would have been *most* in fault, Nancy.'

'But how could you?—'

'One thing is clear. I did not succeed in giving you faith in me, although I had faith in you.'

She looked dubiously at me a moment, then her eyes slowly filled with tears. 'Perhaps I haven't been ready enough to believe in people. Till now, nobody ever seemed to believe in *me*.'

'It is not for me to judge, Nancy. I can only say I am pleased that you had the strength and courage to return here and remain, under the circumstances.'

'You seem to know exactly the best thing to say to encourage me, Miss!' ejaculated Nancy. 'And even when you hit hard, as you sometimes do, I don't seem to mind it so much from you as I do from other people—it's different, somehow! You don't seem to enjoy thinking about my wickedness.'

'If I thought you wicked, I certainly should not enjoy thinking so; and if you were, you would not have come back here. Poor Nancy, I am afraid it has been rather hard for you!'

'If you could only know *how* hard it has been!' she murmured. 'Think of never being spoken to by any of the others for a week; kept in silence and solitude, and looked upon as the *worst* creature that ever breathed!'

'All the more credit to you for bearing it. But we will not talk about that. Let us rather think about the future. I told you I am going to be married shortly—in a month or two probably—and then we are going abroad for a time.'

'Shall I have to stay here till you come back, Miss?' she asked anxiously, her face falling at the thought.

'No; I do not wish it; that would be too much to expect. I am sure I shall be able to make some arrangement for you; possibly I may

arrange for you to stay with a dear old friend of mine, who has only one young servant, until my return; but I promise you shall not remain here much longer.'

This was better; she brightened up wonderfully again, and we spent the rest of the allotted time very cheerfully. What was perhaps most cheering of all to poor Nancy was my little speech about hoping by-and-by to set things right with her relations.

'It's too late for that, Miss,' she replied sadly; 'they know I've been in prison, and poor mother's gone.'

'Too late, indeed! Why, there is almost a lifetime before you in which to prove your innocence! Besides, after you have lived with me long enough to enable me to speak from experience, I will take the matter in hand, and write to your father and sister. In the meantime, we must seek for the poor creature for whom you suffered, and if we can, get her to give evidence that she put the ring into your box.'

She threw up her head and faced the sky. 'Thank God!'

'You see now where thanks are due, Nancy,' I said softly.

'Yes,' drawing a deep breath.

When a loud clanging bell warned us that the time for my leaving her had come, I was more demonstrative in my manner than is customary with me. Several of the other inmates and their visitors were congregated in the yard, and I chose them to see that Nancy Dean had at any rate one friend who believed in her. The sudden flush which covered her face, the expression of the eyes turned towards the other women, as though to say 'You see!' sufficiently thanked me. It was a very pleasant walk home.

I was not a little surprised as well as disappointed to find that Philip did not take kindly to the idea of my last protégée. He came down with Robert Wentworth towards the evening, and Lilian mentioned my afternoon's errand to the Home to the latter, who had been extremely interested in Nancy's case.

Philip asked several questions about it; but I could not get him to shew any interest in Nancy, if he felt any. Indeed I could not help seeing that the idea of my visiting the Home was distasteful to him. It was all the more noticeable because Robert Wentworth had entered so warmly into the subject, taking my proceedings quite for granted.

'What led you to go there, Mary?'

What led me to go there?—what but the happiness his own letter had brought me. But that was not a question to be replied to just then, if ever; so I murmured something about having met Nancy in a state of desperation, and persuaded her to return to the Home, &c.

He said very little; his disapproval was more expressed in his manner than anything else. Seeing that he objected, and did not care to give his reasons for so doing, I did not attempt to discuss the point with him. I must trust to Nancy. If by-and-by she proved to be a success, it would be a better argument in my favour than any I could advance. Besides, I was too happy to allow a slight divergence of opinion between us to disturb me. Of course he knew that he would find me ready enough to yield whenever he

shewed me a reason for so doing; he would find too, that in my heart of hearts I preferred his gaining the victory when it came to reasoning, though it must be a fair field and no favour between us.

But if Philip did not very favourably regard my visits to Nancy, he entered warmly enough into our scheme for improving the cottage homes. He not only approved but helped us in workmanlike fashion with a little carpentering and what not, which we had been unable to compass, beginning with a bracket and shelves, and launching out into more ambitious attempts. We began to contemplate improving the architectural effect with porches to the doors, over which climbing plants were to be trained, placing a seat at the side, and so forth; and if it was not all of the very highest art as to shape and make, it would be, we flattered ourselves, picturesque and comfortable-looking. If the porch proved as attractive as the village ale-house to sit and smoke in, in the summer evenings, it would be something gained.

With regard to the interior arrangements, we were altogether satisfied. Our protégés were beginning to take some little pride in their homes, and to brighten up such parts of them as did not match well with our efforts. We still always took care to leave some part of the room as we found it, to serve as a contrast; and the challenge was now more generally accepted than at first. It must, however, be acknowledged that we still met with occasional opposition. When Jemmy Rodgers, for instance, found that his tobacco jar was not refilled after being suggestively placed in our way, he began to shew his independence again; taking to his old ways and using the table for a kettle-stand. But we looked upon ourselves as successful enough to be as independent as he was now, and we took no further trouble about him or his table. At which Sally Dent informed us he gave it as his opinion that we had more 'grit' in us than he had given us credit for having; and that he wasn't sure he should not give in and clean the table himself. To his astonishment a clean table did not open our hearts; the tobacco jar remained unfilled.

In all our other schemes Philip joined heartily with purse and hand, and yet he so markedly stopped short when Nancy and the Home were in question. How was it? Was his remark about 'the impossibility of a woman retaining the delicate grace and refinement of thought—the, so to speak, bloom of her nature—which is her greatest charm, if she became too familiar with scenes of misery and sin,' intended as a gentle warning to me?

For whomsoever it was intended, she found a ready and able advocate in Robert Wentworth. He very decidedly gave it as his opinion that the delicate grace and bloom and all the rest of it could not be got rid of too quickly, if they were to prevent a woman holding out her hand to any of her own sex who needed help. 'But fortunately, or unfortunately, since there are not too many possessed of it, it is just the delicate grace of a refined woman which is required in such cases.'

'All very well in theory, Wentworth; but if it came to practice? I am sure you would be as desirous as I should be to guard a wife or sister from contact with the degraded?'

'My dear fellow, not I; unless I feared the possibility of some of her virtues being rubbed off by

the contact; in that case she would of course require very careful guarding. But I should be very proud of a sister who could go *safely* amongst those who needed her, be they whom they might.

Philip waived further discussion with a 'By-and-by, Wentworth.' I believe he thought that it was not complimentary to Lilian and me to carry on the conversation in our presence.

I could not but be grateful for the chivalrous respect which both shewed towards women, though I could not help contrasting their very opposite ways of shewing it. One seemed to represent the chivalry of the past, and the other that of the present. I could appreciate both: the poetry and romance of the old chivalry, and the reason and respect in the new; and I did not ask myself which was most really complimentary to women, or whether each was not a little the worse for being so discovered from the other. It might be that in my heart I should have preferred Philip representing the present rather than the past; but I did not acknowledge so much to myself.

But all this was only a faint ripple on our stream, not sufficient to prevent the current from running smooth.

GOOD MANNERS

ARE nothing less than little morals. They are the shadows of virtues, if not virtues themselves. 'A beautiful behaviour is better than a beautiful form; it gives a higher pleasure than statues and pictures; it is the finest of the fine arts.' How well it is then that no one class has a monopoly in this 'finest of fine arts;' that while favourable circumstances undoubtedly do render good manners more common among persons moving in higher rather than in lower spheres, there should nevertheless be no positive hindrance to the poorest classes practising good manners towards each other. For what is a good manner? It is the art of putting our associates at their ease. Whoever makes the fewest persons uncomfortable, is the best-mannered man in a room.

Vanity, ill-nature, want of sympathy, want of sense—these are the chief sources from which bad manners spring. Nor can we imagine an incident in which a man could be at a loss as to what to say or do in company, if he were always considerate for the feelings of others, forgot himself, and did not lose his head or leave his common-sense at home. Such a one may not have studied etiquette, he may be chaotic rather than be in 'good form,' as the slang expression is; and yet because his head and heart are sound, he will speak and act as becomes a gentleman. On the other hand, a very pedant in form and bigot in ceremonies may be nothing better than the 'mildest-mannered man that ever cut a throat.' As we can be wise without learning, so it is quite possible to be well-mannered with little or no knowledge of those rules and forms which are at best only a substitute for common-sense, and which cannot be considered essential to good manners, inasmuch as they vary in every country, and even in the same country change about with the weather-cock of

fashion. Vanity renders people too self-conscious to have good manners, for if we are always thinking of the impression we are making, we cannot give enough attention to the feelings and conversation of others. Without *trying* to be natural—an effort that would make us most artificial—we must be natural by forgetting self in the desire to please others. Elderly unmarried ladies, students, and those who lead lonely lives generally, not unfrequently acquire awkward manners, the result of self-conscious sensitiveness.

Shyness was a source of misery to the late Archbishop Whately. When at Oxford, his white rough coat and white hat obtained for him the sobriquet of 'The White Bear;' and his manners, according to his own account of himself, corresponded with the appellation. He was directed, by way of remedy, to copy the example of the best-mannered men he met in society; but the attempt to do this only increased his shyness. He found that he was all the while thinking of himself rather than of others; whereas thinking of others rather than of one's self is the essence of politeness. Finding that he was making no progress, he said to himself: 'I have tried my very utmost, and find that I must be as awkward as a bear all my life, in spite of it. I will endeavour to think about it as little as a bear, and make up my mind to endure what can't be cured.' In thus endeavouring to shake off all consciousness as to manner, he says: 'I succeeded beyond my expectations; for I not only got rid of the personal suffering of shyness, but also of most of those faults of manner which consciousness produces; and acquired at once an easy and natural manner—careless indeed in the extreme, from its originating in a stern defiance of opinion, which I had convinced myself must be ever against me; rough and awkward, for smoothness and grace are quite out of my way, and of course tutorially pedantic; but unconscious, and therefore giving expression to that good-will towards men which I really feel; and these I believe are the main points.'

Vanity again is the source of that boasting self-assertion which is the bane of manners. He is an ill-mannered man who is always loud in the praises of himself and of his children; who boasting of his rank, of his business, of achievements in his calling, looks down upon lower orders of people; who cannot refrain from having his joke at the expense of another's character, whose smart thing must come out because he has not the gentlemanly feeling that suggests to us

Never to blend our pleasure or our pride
With sorrow to the meanest thing that lives.

The habit of saying rude things, of running people down, springs not so much from ill-nature as from that vanity that would rather lose a friend than a joke. On this point Dr Johnson once remarked: 'Sir, a man has no more right to say an uncivil thing than to act one—no more right to say a rude thing to another than to knock him down.' The vain egotism that disregards others is shewn in various unpolite ways; as, for instance, by neglect of propriety in dress, by the absence of cleanliness, or by indulging in repulsive habits. Some think themselves so well-born, so clever, or so rich, as to be above caring what others say and think of them. It is said that the ancient kings of Egypt used to commence

speeches to their subjects with the formula, 'By the head of Pharaoh, ye are all swine!' We need not wonder that those who take this swine-theory view of their neighbours should be careless of setting their tastes and feelings at defiance. Contrast such puppyism with the conduct of David Ancillon, a famous Huguenot preacher, one of whose motives for studying his sermons with the greatest care was 'that it was shewing too little esteem for the public to take no pains in preparation, and that a man who should appear on a ceremonial day in his night-cap and dressing-gown could not commit a greater breach of civility.'

'Spite and ill-nature,' it has been said, 'are among the most expensive luxuries of life;' and this is true, for none of us can afford to surround himself with the host of enemies we are sure to make if, when young, we allow ill-nature to produce in us unmannerly habits. Good manners, like good words, cost nothing, and are worth everything. What advantage, for instance, did the bookseller on whom Dr Johnson once called to solicit employment get from his brutal reply: 'Go buy a porter's knot and carry trunks?' The surly natures of such men prevent them from ever entertaining angels unawares.

It is want of sympathy, however, much more than a bad nature that produces the ill-mannered hardness of character so well described by Sydney Smith: 'Hardness is a want of minute attention to the feelings of others. It does not proceed from malignity or carelessness of inflicting pain, but from a want of delicate perception of those little things by which pleasure is conferred or pain excited. A hard person thinks he has done enough if he does not speak ill of your relations, your children, or your country; and then, with the greatest good-humour and volubility, and with a total inattention to your individual state and position, gallops over a thousand fine feelings, and leaves in every step the mark of his hoofs upon your heart. Analyse the conversation of a well-bred man who is clear of the besetting sin of hardness; it is a perpetual homage of polite good-nature. In the meantime the gentleman on the other side of you (a highly moral and respectable man) has been crushing little sensibilities, and violating little proprieties, and overlooking little discriminations; and without violating anything which can be called a *rule*, or committing what can be denominated a *fault*, has displeased and dispirited you, from wanting that fine vision which sees little things, and that delicate touch which handles them, and that fine sympathy which this superior moral organisation always bestows.'

Of course we must not judge people too much by external manner; for many a man has nothing of the bear about him but his skin. Nevertheless as we cannot expect people in general to take time to see whether we are what we seem to be, it is foolish to roll ourselves into a prickly ball on the approach of strangers. If we do so, we cannot wonder at their exclaiming: 'A rough Christian!' as the dog said of the hedgehog.

It is difficult to see how the 'natural-born fool'—to use an American expression—can ever hope to become well-mannered, for without good sense, or rather tact, a man must continually make a fool of himself in society. Why are women as a rule better-mannered than men? Because their greater

sympathy and power of quicker intuition give to them finer tact. Nor is talent which knows what to do of much use, if the tact be wanting which should enable us to see how to do it. He who has talent without tact is like the millionaire who never has a penny of ready-money about him. Mr Smiles illustrates the difference between a man of quick tact and of no tact whatever by an interview which he says once took place between Lord Palmerston and Mr Behnes the sculptor. At the last sitting which Lord Palmerston gave him, Behnes opened the conversation with: 'Any news, my lord, from France? How do we stand with Louis Napoleon?' The Foreign Secretary raised his eyebrows for an instant, and quietly replied: 'Really, Mr Behnes, I don't know; I have not seen the newspapers!' Behnes, with much talent, was one of the many men who entirely missed their way in life through want of tact.

Nowhere is there room for the display of good manners so much as in conversation. Well-mannered people do not talk too much. Remembering that the first syllable of the word conversation is *con* (with), that it means talking with another, they abstain from lecturing, and are as ready to listen as to be heard. They are neither impatient to interrupt others nor uneasy when interrupted themselves. Knowing that their anecdote or sharp reply will keep, or need not find utterance at all, they give full attention to their companion, and do not by their looks vote him a bore, or at least an interruption to their own much better remarks. But beside the rule, that we should not be impatient to get in our word, that a few brilliant flashes of *silence* should occur in our conversation, another rule is, not to take for our theme—ourselves. We must remember that, as a rule, we and our concerns can be of no more importance to other men than they and their concerns are to us. Why then should we go over the annals of our lives generally and of our diseases in particular to comparative strangers; why review the hardships we have suffered in money matters, in love, at law, in our profession, or loudly boast of successes in each of these departments? Why, lastly, should the pride that apes humility induce us to fish for compliments by talking *ad nauseam* of our faults? We need not say that low gossip or scandal-bearing is quite incompatible with good manners. 'The occasions of silence,' says Bishop Butler, 'are obvious—namely when a man has nothing to say, or nothing but what is better unsaid; better either in regard to some particular persons he is present with, or from its being an interruption to conversation of a more agreeable kind; or better, lastly, with regard to himself.'

A well-mannered man is courteous to all sorts and conditions of men. He is respectful to his inferiors as well as to his equals and superiors. Honouring the image of God in every man, his good manners are not reserved for the few who can pay for them, or who make themselves feared. Like the gentle summer air, his civility plays round all alike. 'The love and admiration,' says Canon Kingsley, 'which that truly brave and loving man Sir Sidney Smith won from every one, rich and poor, with whom he came in contact, seems to have arisen from the one fact, that without, perhaps, having any such conscious intention, he treated rich and poor, his own servants, and the noblemen his guests, alike, and alike courteously, consider-

ately, cheerfully, affectionately—so leaving a blessing and reaping a blessing wherever he went.' Certainly the working-classes of England, however respectful they may be to those whom—often for interested reasons—they call 'their betters,' are far from being sufficiently polite to each other. Why should not British labourers when they meet take off their hats to each other, and courteously ask after Mrs Hardwork and family? There is not a moment of their lives the enjoyment of which might not be enhanced by kindness of this sort—in the workshop, in the street, or at home.

We know that extremes meet, and there is an over-civility that becomes less than civil, because it forces people to act contrary to their inclinations. Well-mannered people consult the wishes of others rather than their own. They do not proceed in a tyrannical manner to prescribe what their friends shall eat and drink, nor do they put them in the awkward position of having to answer a thousand apologies for their entertainment. When guests refuse an offered civility, we ought not to press it. When they desire to leave our house, it is really bad manners to lock the stable-door, hide their hats, and have recourse to similar artifices to prevent their doing so. As, however, this zeal of hospitality without knowledge is a good fault, and one not too common, there is perhaps no need to say more about it. It leans to virtue's side.

We must not confound etiquette with good manners, for the arbitrary rules of the former are very often absurd, and differ in various ages and countries; whereas good manners, founded as they are on common-sense, are always and everywhere the same. It would be invidious to illustrate this assertion from the society of our own country, so we shall import a *reductio ad absurdum* of etiquette from Japan. In *The Gentle Life*, the following account is given by a resident at the Japanese court. 'When one courtier was insulted by another, he who bore the insult turned round to the insulter, and quietly uncovering the stomach, ripped himself open. The aggressor, by an inexorable law of etiquette, was bound to follow the lead, and so the two die. The most heart-rending look ever witnessed was one given by a Japanese, who, having been insulted by an American, carried out the rule, expecting his opponent to follow suit. But the Yankee would do nothing of the sort; and the Japanese expired in agonies—not from the torture of his wound, but from being a sacrifice to so foolish and underbred a fellow—whilst the American looked at him in a maze of wonder.' If it were not so sad, we might laugh at such accounts of self-torture, as well as at people of our own acquaintance who, worshipping conventionality, are ever on the rack about 'the right thing to do,' about 'good form.'

But this sort of folly should not blind us to the value of good manners as distinguished from etiquette.

Manners are not idle, but the fruit
Of noble nature and of loyal mind.

Were it not for the oil of civility, how could the wheels of society continue to work? Money, talent, rank, these are keys that turn some locks; but kindness or a sympathetic manner is a master-key that can open all. If 'virtue itself offends when coupled with a forbidding manner,' how

great must be the power of winning manners, such as steer between bluntness and plain-dealing, between giving merited praise and flattery.

Men succeed in their professions quite as much by complaisance and kindness of manner as by talent. Demosthenes, in giving his well-known advice to an orator—that eloquence consisted in three things, the first 'action,' the second 'action,' and the third 'action'—is supposed to have intended manner only. A telling preacher in his opening remarks gains the good-will of his hearers, and makes them feel both that he has something to say and that he can say it—by his manner. The successful medical man on entering a sick-room inspires into his patients belief in himself, and that hope which is so favourable to longevity—by his manner. Considering that jurymen are scarcely personifications of pure reason unmixed with passion or prejudice, a barrister cannot afford to neglect manner if he would bring twelve men one after another to his way of thinking. Again, has the business man any stock-in-trade that pays him better than a good address? And as regards the 'survival of the fittest' in tournaments for a lady's hand, is it not a 'natural selection' when the old motto 'Manners makyth man' decides the contest? At least Wilkes, the best-mannered but ugliest man of his day, thought so. 'I am,' he said, 'the ugliest man in the three kingdoms; but if you give me a quarter of an hour's start, I will gain the love of any woman before the handsomest.'

If kindness of disposition be the essence of good manners, our subject is seen at once to shade off into the great one of Christianity itself. It is the heart that makes both the true gentleman and the great theologian. The apostle Paul (see speech delivered on Mars' Hill) always endeavoured to conciliate his audience when he commenced addressing them. And his letters, as well as those of his fellow-apostles, are full of sympathy and consideration for every one's feelings, because he had learned from Him whose sympathy extended to even the greatest of sinners.

THE DUKE'S PIPER.

A STORY OF THE WEST HIGHLANDS.

IN FOUR CHAPTERS.—CHAPTER II.

'Oh, Angus!' Maggie held out her hand to him on the pier, and he held it as in a vice. 'It iss your own poat, then, Angus?'

'No; she iss not,' said Angus.

'No?'

'No! She iss yours, Maggie! I built her for ye—every inch of her grew under my own hand—and she's no a pad poat at all, though it iss me that says it!—'

'Well, Angus?—'

'Don't say another word, but go abcard,' said Angus, proceeding down the steep slippery steps to the loch, leading Maggie gallantly by the hand. Speedily the rope was unloosed, the white sail spread to the breeze, and the boat moved gracefully and rapidly, under a glorious sunset sky, out into the loch. Maggie sat holding the tiller silently while Angus adjusted the ropes. The loch was radiant from shore to shore in the rich evening light; quickly the white houses of the town were left in the distance; and hardly a movement but the delicious ripple of water cleft by the

boat's bow, or the cry of a sea-gull sailing lazily overhead, disturbed the stillness. Here and there in the pools among the boulders in lonely parts of the shore, a heron stood silent as its own shadow and solitary as a hermit; from the grassy hollows by the beach a thin white mist rose, softening the green wooded slopes, and adding a sense of distance to the heathery ridges in the background, glorified by the red autumn sunset. Maggie was supremely happy. When the sail was fairly set, Angus came and stretched himself by her side.

'And ye think she iss a nice poat, and ye like her?' he said, looking into Maggie's face.

'It wass fery kind of ye to think of giving me such a present as this, Angus; but I cannot possibly take it.'

'Maggie,' said Angus, taking her disengaged hand in his, 'I hef long wanted to tell you something—indeed I hef, Maggie—not that I'm a goot hand at telling anything I want, but—all the time I wass building her, and that wass longer than ye might think, Maggie—I hef looked to this moment as a reward—when I would see you sitting there, looking that happy and that peantiful—yes, Maggie, peantiful, and pleased with my work—and proud am I to see ye so pleased wi' a trifle'—

'But it iss *not* a trifle,' said the maiden interrupting him; 'it wass a great undertaking! I nefer saw anything I liked half so much.'

'But it iss nothing, I tell you, Maggie, to what I would gif you if you would be willing to take it—nothing! I would like you, Maggie, to take all I hef—and myself too. It iss true I am only a common sailor, but Maggie, my heart iss fery warm to you. Many's the time, when I wass a hundred and maybe thousands of miles away from here, I wad pe thinking of you—many a time in the middle of the night, when I wass on the deck alone, watching and looking at the stars under a foreign sky, I would single out a particular star and call it Maggie's eye, and watch it lovingly, cass I thoctt you might pe looking at it too, even if you wass not thinking of me thousands of miles off; and it makes me fery unhappy when I'm a long way off, to think that maybe I am forgotten, and some other man iss trying to get your love, and maybe I losing my chance of happiness for life, cass, like a fool, I held my peace, when by speaking a word my happiness and yours might pe secure.'

Angus's arm had stolen round the girl's waist as he proceeded in the speech that was a direct out-flow from his heart. She did not try to speak for a little. Angus saw that her eyes were filled with tears.

'It wass wrong of ye, Angus, efer to think I would forget ye,' she said.

'Then ye do think sometimes apoot me when I am not near you?'

'Angus, how can you pe speaking nonsense like that!'

'But it iss not nonsense to me, Maggie,' said her lover seriously; 'I love you, Maggie, as I love no woman in the world; and Maggie, if you were to—to—it wad break my'—

It wass the old story. Two human souls meeting under the light of heaven, each recognising in the other that which each yearned for, to give completeness to life; the spoken word being the

outward force impelling them towards each other, as two dewdrops merge into one by a movement external to both. The Highland girl had no desire to break her lover's heart; nay, she was ready to give her own in exchange for his love with all the impulsiveness of a simple and true nature. As the boat sped on they noted not that twilight was deepening into evening, that the stars were myriad-eyed above them, and the crescent moon glimmered over the hills and shone in quivering tracks along the loch. So it came about that at the same moment of time when the piper in the clachan was apostrophising Angus's father in the words already recorded—'Nae doot your son Angus will pe wanting me to learn him to play the pipes too; and nae doot, when he comes for that purpose, he will look to have his crack wi' Maggie,' &c.—his daughter's arms were being thrown impulsively about Angus's neck, and Angus himself was the happiest man in the Western Highlands.

Maggie reached Glen Heath with a joyous heart. She was there before the piper. She speedily girt on her apron, and with tucked-up sleeves proceeded to the more prosaic duty of baking 'scones' that might be warm and palatable for the piper's supper; and as she rolled out the dough, and patted and rolled and kneaded it, and turned it before the fire until an appetising browniness covered each surface, she sung merrily one of the merriest of the sad Gaelic melodies.

But the piper was late. The white cloth was spread, and the scones had time to cool, before Diana leaping to her feet, stretched herself, yawned, and went to the door sniffing. Maggie opened the door immediately; the piper swung along the path unsteadily. The dog went to meet him without enthusiasm, half-doubtful of her reception, and only narrowly escaped the kick which the piper aimed at her.

'Get out, ye prute!' he said, as he came in; and when the animal still came fawning towards him, he hurled his bagpipes with great force at her head, only with the result, however, of breaking the pipe's moutpiece. 'O the prute!' he cried when he saw what had happened; 'she has proken my favourite shanter—the shanter that I've played wi' for fifteen years. O the prute! I'll cut her throat, to teach her to keep oot o' my way. My best shanter too!'

'Come, dad, you are late,' said Maggie cheerily, going to meet him; 'you hef had a long walk. I hef boiled some eggs for ye, and baked some scones; come, hef some supper before ye go to bed.'

'Ay, ay, ye are a praw lass, Maggie, one o' the right sort,' the piper said. 'But to think my poor shanter's broken. I will nefer see her like again whatefer!'

The piper sat down to supper with an enormous appetite, and Maggie waited upon him devotedly, uncertain whether she should reveal her secret or not in the present dubious state of her father's temper.

'Anypody peen here for me the day?' he asked between mouthfuls.

'Yes, Angus MacTavish wass here in the afternoon; and he'—

The piper laid down his knife, looked straight in his daughter's face with a fierceness that startled her, saying: 'Hang Angus MacTavish and efery man i' their black clan! A MacTavish nefer

darkens my threshold again! If Angus MacTavish efer comes to my house he will live to rue it. I hate efery living MacTavish!

Maggie looked in her father's face amazed. To violent language she was well accustomed; but sober or otherwise, she had never heard him utter a word against the MacTavishes until now.

'Come, dad,' she said after a short silence, during which time she decided it would be better to say nothing of what was uppermost in her mind until morning—'come, dad; something has vexed you to-night. You will be petter in the morning. Angus iss the best friend either you or I hef in the wide world.'

'I tell you,' burst out the piper, 'I will not hef his name mentioned in my hoose, not by you or any other! And if you go apoot with him, Meg, as I hef seen ye do lately, I'll—I'll maybe pack you out of doors too!'

The tears were in poor Maggie's eyes, but she comforted herself as she put up the bolt in the door for the night, by assuring herself, as she heard the piper stumbling up-stairs to his room: 'Poor dad, he iss worse than usual to-night.' And when she slept, she dreamed of Angus.

CHAPTER III.

The piper's anger seemed to be modified on the following morning; but he still growled when his daughter introduced the name MacTavish as he sat before a steaming bowl of porridge and a basin of milk, which he attacked with a large horn spoon and an appetite comparable only to the giant's who fell a victim to the adroitness of Jack the celebrated Giant-killer. Maggie's enthusiastic account of Angus's gift of the boat was received with a critical coldness that made her heart sink within her.

'O ay, Maggie; it iss no doot a peautiful poat—she wass sure to pe that if Angus built her; but it iss fery easy to see what Angus MacTavish iss driving at. Maybe he'll find he has been counting without his host mifer, if he thinks he iss going to get you for his wife by gifting you a fishing-poat; what wass a fishing-poat to a lass like you!—as if ye wass a poor lass! Ye're no to pe fashing your head apoot Angus MacTavish, lass—no; he iss no doot a cood lad, but no for the like o' you! There iss Sandy Buchanan noo, the lawyer's clerk mifer, a far more likely lad to make ye a cood man, and willing?'

'O dad, and how can ye pe saying such things to me on the happiest day o' my life, for Angus asked me yesterday to be his wife; and I—I!'

'Ye what?' said the piper, laying down his spoon and eyeing his daughter sternly.

'Weel, dad, I—I—didn't say No.'

'Then I'm thinking ye'll hef to go this fery day whatefer and say "No," my lass, for I'm telling ye I won't hef it!'

Maggie was not generally one of the tearful sort, but the sudden emphasis of her father's words filled her eyes with tears and drove her to silence. She did not trust herself to speak, but lifted her pail hurriedly with a flushed face, and went sorrowfully to milk the 'kye,' whose deep impatient lowing from the byre was urgently demanding attention. When she was half across the courtyard she heard her father calling her back. She turned and went to him.

'Maggie,' he said, drawing her to his knee and holding her brown face between his rough hands tenderly, 'it iss not crying ye are, my bonny lass? No; I wad not hef my lass crying for any MacTavish that efer drank a dram! Not that Angus iss a pad lad—no, I will not say he iss that—he plays the pipes petter than any lad of his years I efer saw—but the MacTavishes— Ah weel, they're no jist the clan that the Camerons should marry into. Noo, dry your eyes, lass, and pe off to your milking mifer—Crumple iss moaning as if her udder wass going to crack.'

The maiden said nothing; she kissed him, but the smile was all vanished from her face as she stooped to relieve Crumple of her milky burden.

The piper went to the stable, and the sound of his whistling rang over the place as he brushed down his horses and gave them their morning feed.

Maggie was in strong hopes, as the morning advanced, that before nightfall, when she expected Angus to come, the tempest would be over, and Angus hailed by her father in his old manner. This hope was dispelled, and poor Maggie made miserable beyond bearing when her father returned to his mid-day meal. The piper had early in the forenoon taken his fishing-rod and gone to a favourite spot of his known as 'the Black Hole,' on the stream, where he had wiled away many an hour and tempted to the bank many a fat spotted trout. When he returned to dinner, his daughter saw with surprise that he brought no fish with him, and that his fishing-rod was broken into half-a-dozen pieces; and moreover, that he was white with anger. Fingal his collie was following with dejected tail and a torn ear, apparently in as bad a temper as his master, judging from the snarling greeting he gave Diana who went to meet them.

'Py the powers, but I'll put the law on him; I'll hef him put in the jail,' cried the piper, as he went into his kitchen and tossed the fragments of his fishing-rod into a corner. 'The planguard, to break my fishing-rod and steal my fish mifer; but I'll hef the law on him! He shall go pefore the shuirra as sure as my name iss John Cameron!'

Maggie did not know that Mr MacTavish was at the same moment on his way home with a swollen black eye, carrying with him a goodly fish that ought to have been in the piper's basket, 'Jet' limping behind his master very much bruised indeed.

'And it iss the Teuk that wull pe told all apoot it; the prood telfe, poaching the salmon like a common thief, and knocking a man apoot as if he wass a lower animal,' said the game-keeper, recording his grievance indignantly to his buxom wife, in answer to sympathetic ejaculations as to the state of his eye, when he returned to his dinner.

True to his word, the piper sent the herd-boy to the lawyer's office to tell Sandy Buchanan, with the piper's compliments, &c., that Mr Cameron desired to see him at Glen Heath on important business.

'Well, dad,' Maggie had said impetuously when she heard this message given to 'Geordy,' as they sat at dinner, hardly understanding from what motive her father sought the presence of the detested Sandy Buchanan, 'I can only say that I

shall not bide in the hoose if that red-headed, ill-looking man comes to the hoose; I won't inteed!' 'Ye are red-headed yourself!' said the piper abruptly.

'No; I'm not.'

'Yes, ye are. The man canna help himself if the Almighty gef him a red head. The best o' folks iss red-headed. I'm red-headed; and ye are red as a fox or a squirrel yourself, I tell ye'—

'Well, well, dad, we'll no quarrel apoot that; maybe I am; but'—

'I tell ye what it iss, Maggie, ye will bide at home when Mr Buchanan comes, and ye'll pehave yourself civilly, or maybe it may pe worse for ye. Angus MacTavish hass turned your head; but he'll get a bit o' my mind maybe yet, as his father hass pefore him mifer, and that pefore the set o' sun too!'

'O dad, dad! ye'll break my heart, so ye will, inteed and inteed ye will, dad, if it iss in that way ye speak o' Angus.'

'I'll not hef him come apoot my hoose longer! He iss a wanderin' rake; efery sailor iss that, and no fit to make a cood huspand to the like o' you.'

'He iss not a rake! Ye are no speaking the words of truth, father!' exclaimed the girl passionately.

'Efery sailor iss a rake, Maggie; eferybody knows that; and I daresay he iss none better than his neighbors.'

Stung by the cruel words, Maggie ran to the dairy, where she shut herself in and burst into a flood of tears. The Highland maid had few hatreds; she had the impulsive almost passionate temperament of every true Celt, but her impulsiveness ran in loving channels. But if she did hate, she hated warmly—also after the Celtic manner. And the one living object for whom she felt undying scorn was this Sandy Buchanan, who knew more of her father's affairs than any man in Inversnow; and whose studied civility to her on all occasions, and attentions more or less marked, were resented by her as she would have resented another man's insults. Perhaps he was all the more despised because he kept at a respectful distance when Angus was at home; a peculiarity that Maggie attributed to a certain dread of physical consequences, that was not to be wondered at in a weak-legged milkop fellow like him. But whenever the Duke's yacht was away, Mr Sandy danced attendance upon her assiduously, insisting upon seeing her safely home from the kirk on Sunday evenings, and otherwise thrusting his obnoxious presence upon her in ways which she considered offensive.

And sure enough, just as the sun was veering round to the west, the piper was seated at the table of his best parlour with a bottle of whisky and glasses, and a plate of Maggie's crisp oatmeal bannocks between him and the detested Sandy Buchanan, whose breath blew forth gales of peppermint—an odour that Maggie always associated with him, and put the worst construction upon—as he listened patiently to the rather confused statement of the piper's grievance. Sandy tried honestly to look at the case from the piper's stand-point; but put in any form, it appeared that if any legal action was to be taken the decision could hardly take the only form which would satisfy the irate piper—namely the immediate arrest, trial, conviction, and imprisonment of Mr MacTavish for

an undefined number of months in the county jail. Sandy gathered that the piper had succeeded in hooking a 'cood seven-pound grilse'; that while he was landing the same, Mr MacTavish appeared on the scene threatening to report him to the Duke for poaching; words passed between them, not of a complimentary nature, ending ultimately in one of two catastrophes—the piper could not clearly remember which—either the game-keeper had seized the piper's rod with result of breaking it to pieces, or the piper had broken his fishing-rod over the game-keeper's back; and then a struggle had ensued, the upshot of which was that the latter walked off with the 'grilse' and a black eye, while the former did the like with his shattered fishing-rod and empty basket, each vowing to lay the matter before 'the shirra.'

The Sheriff, as represented by Sandy Buchanan the fiscal's clerk, thought, much to the delight of the piper, that he had good ground for an action for assault against Mr MacTavish; and presently father and daughter (poor Maggie was compelled to remain in the room to hear the brutal manner in which he, a Cameron, had been treated by a MacTavish) were thrown into a state of mental confusion by the adroit manner in which Sandy now addressing the piper as 'our client,' now as 'the plaintiff,' both of which phrases the piper received and acknowledged in the light of a personal compliment, and also by liberal but not very coherent allusion to Act of Queen Victoria this, and chapter of Act Queen Victoria that; all tending to prove the piper the most abused and injured of men.

In the midst of the conference Angus MacTavish appeared at the door. He indiscreetly opened it and looked in without knocking. The piper, who was feeling at the moment keenly alive to his own importance, with the delightful sense that he had matter to bring before the 'shirra' (as he called the Sheriff), looked up and frowned, fingering his glass of whisky the while.

'What idiot iss it that walks into a shentleman's hoose without knocking at the door, and without waiting to be asked to come in?'

'Come, piper,' said Angus, walking boldly into the room, somewhat surprised to see Buchanan there, but holding an outstretched hand to the piper; 'it iss not the first, nor the second, nor maybe the twentieth time I hef hed your hospitality, and I am thinking it will not pe the last time—and that without claiming it.'

'My name is Maister Cameron—Maister Cameron of Glen Heath, Maister Angus MacTavish! And apoot its peing the last time or not depends upon more considerations than one!' The piper spoke with a sternness and pomposity of manner that made his visitor allow his hand to drop quickly to his side, and brought an indignant flush to the young face.

'What does it all mean?' said Angus in a bewildered way, turning to Maggie.

Maggie stood behind her father's chair the personification of misery. The man of law sat looking stolidly before him with the most wooden of expressions on his pale face.

'It means,' said the piper in the same harsh sharp key, 'that *that* is the door, that yonder is the road, that *the* quicker ye are there the petter it will pe for you, and the petter pleased too will all in this room pe.'

'Iss that it?' said Angus slowly, looking still at Maggie, and turning again towards the door.

'No, Angus, no! It iss not true that all in this room will pe petter pleased that ye should go. It iss not true!' burst out the girl in the fullness of her heart.

'But it *shall* pe true!' shouted the piper, bringing his hand firmly down upon the table. Angus did not stay to argue the matter, but sorrowfully went his way.

'Stop that whining, Maggie—stop that foolish whining; I will not hef it!' said the piper, turning upon his daughter fiercely, who tried in vain to repress a sob as Angus disappeared.

'O Sandy Buchanan, it iss muckle that ye'll hef to answer for, if ye'll make me that I'll hate my own father too,' said the poor girl, storming out into open mutiny.

'Leave the room, Maggie!' cried the piper, waving his hand. The maiden gladly availed herself of her dismissal, and fled to the solitude of her own room. 'Cott has not gifen to women the brains to understand business,' he continued, generalising apologetically to his guest.

A week passed, and the piper's wrath against the clan MacTavish endured. The feud was not one-sided. Mr MacTavish replied to a letter full of nothing, expressed in the bitterest legal phraseology, written by Sandy Buchanan on the piper's behalf, by a document of elaborate counter-charges, written by the banker-lawyer of the town, breathing threatenings and lawsuits. And the case promised to be profitable to both of these astute gentlemen, as such cases generally manage to be.

HINTS TO SICK-NURSES.

TRYING as are many, indeed we may truly say most of the duties of the sick-room, nothing renders them so much so as the fact that the disease under which the patient is suffering is of an infectious, or of a contagious nature.

There is a great deal to be said on the head of avoidance of infection or contagion, while nursing a sufferer through disease of either one nature or the other. In this as in all other matters connected with sick-nursing, heroic, would-be-martyr-like conduct is absurd and blamable, for prudence goes for a great deal, and indiscretion brings trouble and suffering on others as well as yourself. 'I don't mind *what* risk I run; I am too anxious to think about myself!' always seems to us a feeble and (to use a strong northern word) a very feckless sort of remark, only made, in nine cases out of ten, to exact the tribute of a surprised or admiring look. On the contrary, the aim and end of every sick-nurse should be to do as much good and be as much comfort as possible *with the least possible risk*. To achieve this, the smallest and most apparently trivial precautions are worth taking, in order to prevent the friends and relatives about you having the additional trouble and anxiety of nursing you as a second invalid, just when 'number one' is recovering.

'I am so anxious I can't eat! I haven't touched a morsel to-day!' are by no means uncommon

remarks to hear from the lips of some one who is nursing, or assisting to nurse a case of infectious disease. Yet this abstinence is just the very worst thing you can possibly do under such circumstances, and the most calculated to render yourself an easy prey to that unseen influence pervading the air, and like the seeds of some poisonous plant, ready to take root if soil be found favourable to its growth. Feebleness, over-weariness, exhaustion, want of sufficient nourishment—all these things aid in preparing this suitable soil, and woo the disease genus that are floating about in the air to take root and bring forth bitter fruit. A vigorous cheerful person, capable of strong self-control, often seems able to defy the closest contact with disease; and even if some *malaise* (often closely allied to the disease of the patient) knocks over the willing nurse for a time, the elastic constitution of body and mind seems to throw off the poison, and no serious illness results. Nothing is more common than the occurrence of these spurious attacks of illness, allied to that from which the person nursed is suffering, and the following case is an example.

A lady nursing a friend in small-pox, after lengthened attendance in the sick-room, was attacked by faintness, shivering, a sensation of nausea, and violent headache. Both the nurse and her friends concluded that a seizure of the loathsome disease from which the patient was suffering was inevitable. However, the following day several large blotches appeared on various parts of the body; all unpleasant symptoms gradually disappeared; and in a day or two—without the original sufferer having had any idea that her nurse was kept away by anything more serious than need of rest—she was able to return to her duties, and never suffered any further deterioration of health. In the same way we have known those who were nursing cases of fever to be suddenly attacked by sore throat, headache, and vertigo, these symptoms passing off after twenty-four or forty-eight hours, and no further evil resulting. A vigorous constitution, care while nurse-tending as to diet and exercise, joined to a mind calm and equable, and ready to face all possibilities without flurry, feverish excitement, or fear, will in many cases enable the sick-nurse to throw off the seeds of disease. But a malignant influence which floats in the atmosphere of the sick-room, pervading the breath of the sick person, and hanging like a bad odour about the bed-clothes, carpets, and even the wall-paper of the room, is necessarily a difficult enemy to evade—and such is infection. And any one who has a timorous dread of it is far better away from the sick-room.

This is, we think, a matter that cannot be too strongly insisted upon. To watch for symptoms is often to develop them; and constant dwelling upon the condition of any one organ of the body, and apprehension as to disease in that organ, will often produce at all events functional derangement

if no greater evil. By this we do not mean that neglect of one's self is ever justifiable, but only that fearful and timorous apprehension is deleterious.

So strongly has this fact impressed itself upon us with regard to infection, that we even think it would be well to strain a point, and encourage a person to absent herself from the sick-room, rather than run the risk of leaving a nurse of this temperament near a patient suffering from disease of a catching nature. In sickness the perceptions are often rendered painfully acute, and the mind naturally much concentrated on itself, is therefore ready to take offence or be troubled by trifles. We have seen a patient shrink from the ministrations of a person whom he felt to be in a state of fear.

Just in the same way, if the duties of the sick-room are (as they often must be) unpleasant, a look of aversion or disgust is enough to wound the sufferer beyond the power of caress or words to heal! A woman who turns sick, or is obliged to put a handkerchief to her nose at a foul smell—who shudders at the sight of blood, ought never to be in a sick-room. The same may be said of one who is always feeling her own pulse, or (as we once saw) looking at her own tongue in the glass (by no means a graceful proceeding), to see if symptoms are 'declaring themselves.' All or much of this sort of nervousness may be affectation; but at the same time we must not judge unkindly of those who from natural temperament dread infection, and are therefore likely to fall a prey to it.

And now, taking it for granted that we have a tolerably sensible woman to deal with, and that she is called upon to nurse a case of fever, small-pox, diphtheria, or any such-like unpleasant ailment, what precautions are best calculated to reduce the risk of infection to a minimum?—a risk which we cannot do away with, but are certainly called upon to guard against to the utmost in our power. Attention to diet, so as to ward off great exhaustion at any time, and taking at least half an hour's exercise in the open air, are excellent rules to observe. Never go into the sick-room *fasting*. And here we must strongly urge upon every sick-nurse the value of coffee as a restorative. In times of cholera epidemics among our soldiers, the first precaution the authorities invariably take is to order a cup of strong coffee to be served out to each man the first thing in the morning. The effects of this plan are known to be admirable.

Take a brisk walk shortly after your breakfast; order a cup of hot strong coffee to be ready when you come in, and take it *before going into the patient's room*. Nothing helps to throw off the weariness of a night's watching like this turn in the fresh air (even if taken of necessity under an umbrella), and the coffee braces the nerves and invigorates the system.

To speak of the avoidance of alcoholic stimulants is to enter upon delicate ground; though we are of opinion that in *serious* cases the nurse should seldom touch anything stronger than coffee throughout the whole time. This abstaining gives a power of recovering with great promptitude from the effects of long-continued watching and heavy duties in the sick-room. Depend upon it that the

recurring glass of sherry, the oft-repeated 'nip' of brandy-and-water, do a world of harm both in the sick-room and out of it.

That wine and brandy are valuable restoratives in weakness, cannot be denied; and it is certain that there are many constitutions which need a moderate amount of stimulant; but that stimulants are taken to a perfectly needless and most pernicious extent, even by those who by no means come under the term 'drunkard,' and that among these are numbered women as well as men, is a stubborn and unhappy fact. One of the many evils resulting from this over-use of stimulants is this: when severe illness and prostration call for wine or brandy, the system is so used to their action that but little benefit accrues; at all events, little when compared to that prompt answer the constitution gives to even small doses, when that constitution has either made very sparing use, or no use at all, of such whips and spurs to the energies of life.

The proper ventilation of a sick-room is a most important means of lessening the danger of infection; and this more particularly in such diseases as fever, small-pox, or diphtheria—that is, diseases coming distinctly under the head infectious. In those which are contagious, ventilation is of course also important, but not equally so. And this leads us on to speak of the difference between infection and contagion. Infection is subtly diffused through the atmosphere, the patient's breath, the clothes, hangings, walls, &c. Contagion consists in the disease being propagated by the emanations of the sick person. It is therefore obvious that the latter (contagion) is more easily guarded against by a prudent person than the former (infection). The plentiful use of disinfectants seems to be one of the best preventives against contagion; but of course all such details are generally regulated by the medical man in attendance, and no better advice can be given to the amateur sick-nurse than to follow his directions *implicitly*.

We will, before leaving this subject, quote one passage from Dr Aitken's excellent work, *The Science and Practice of Medicine*. In volume one, page 222, he says: 'Ill-health of any kind therefore favours the action of epidemic influences.' Thus then, we see how one of our highest medical authorities bears out the truth of what we have said—namely that for the sick-nurse to neglect her own health—to go without sufficient and regular food—in a word, to lower by any means whatever the standard of her own physical condition, is to intensify the risk of infection or contagion for herself, and trouble and anxiety for those belonging to her.

We have no belief in the disinfecting of clothes that have been worn during attendance on cases of an infectious nature. It is far better to wear an old dress, wrapper, shawl, &c., and when the illness is over *have them burned*. The same thing applies to clothing worn by the patient.

We remember one most lamentable case where (as was supposed) everything was disinfected, washed, and exposed to the air; yet the gift of a night-dress to a poor woman resulted in virulent small-pox, and the sufferer, a young married woman, was cruelly disfigured in spite of the best care and nursing an hospital could give.

It comes then to this: infection cannot be

evaded; but risk may be reduced to a minimum by an observance of the precautions we have noted, by the exercise of plain common-sense, and by the *reality*—not romance—of devotion to the work undertaken by the sick-nurse.

INDIAN MILITARY SPORTS.

FOR the following amusing account of some of the more popular of Eastern regimental sports we are indebted to an officer in India. He proceeds as follows:

The sports of the native Indian cavalry, commonly called *Nesi Basi*, are much encouraged by the authorities, as to excel in them requires steady nerve and good riding. I believe it is the custom in most regiments to devote one morning a week to these essentially military games. They are most popular with the men, it is easy to see, for besides the hundred or so who generally turn out to compete, the greater part of the regiment is present on foot as spectators.

The proceedings generally commence with tent-pegging pure and simple. A short peg is driven into the ground, while some two hundred yards distant the competitors are drawn up in line, each on his own horse; for the native *sowar*, like the vassal of our own past times, comes mounted and armed to his regiment. While off duty the native soldier can dress as he pleases, so on occasions like the present, individual taste breaks forth in showy waistcoat or gorgeous coloured turban. Each man carries a bamboo spear in his hand. At a signal given by the *wordi major* or native adjutant, the first man, his spear held across his body, starts at a canter; his wiry little country-bred knows as well as he does what is in hand, and as the speed quickens to a gallop, the pace is regular and measured, enabling his rider to sit as steady as a rock. When about fifty yards from the object the *sowar* turns his spear-point downward, bends well over the saddle till his hand is below the girth, and then, when you almost think he has gone past, an imperceptible turn of the wrist and—swish—the spear is brandished round his head, with the peg transfixed on its point. Another is quickly driven into the ground, and the next man comes up; he too hits the peg, but perhaps fails to carry it away to the required distance, for it drops from his spear-point as he is in the act of whirling it round his head. This does not count, and he retires discomfited. The third misses entirely; the fourth strikes but does not remove the peg from the ground; while after them in quick succession come two or three who carry it off triumphantly. With varying fortune the whole squad goes by; and it is interesting to note the style of each horseman as he passes, some sitting rigid till within a few yards of the mark; others bending over and taking aim while still at a distance; some silent, others shouting and gesticulating; while one no sooner has his steed in motion than he gives vent to a certain *tremolo* sound, kept up like the rattle of a steam-engine, till close upon the peg, which having skill-

fully transfixed, he at the same time throws his voice up an octave or two, in triumph I suppose, as he gallops round and joins his comrades. Two or three men now bring up their horses with neither saddle nor bridle, and with consummate skill, guiding them by leg-pressure alone, carry off the peg triumphantly, amid well-deserved cries of '*Shabash!*' from the spectators.

The next part of the programme is 'lime-cutting.' Three lemons are put up on sticks about twenty yards apart; and as the *sowar* gallops past, tulwar in hand, he has successively to cut them in two without touching the sticks—a by no means easy feat. Then three handkerchiefs are placed on the ground; and a horseman, riding barebacked a good-looking bay, flies past in a very cloud of dust, and on his way stoops, picks up, and throws over his shoulder each handkerchief as he comes to it.

And now we come to the most difficult feat of all. A piece of wood a little larger than a tent-peg is driven into the ground, and a notch having been made in the top, a rupee is therein placed so as to be half hidden from view. The feat is to ride at this, lance in hand, and to knock out the rupee without touching the wood—a performance requiring rare skill and dexterity; yet it is generally accomplished successfully, once or twice, by the best hands of the regiment.

Perhaps the proceedings may close with something of a comic nature, one man coming past hanging by his heels from the saddle, shouting and gesticulating; others facing their horses' tails, firing pistols at a supposed enemy, with more antics of a like nature, often ending in an ignominious cropper, though the nimble *fareem* generally succeeds in landing on his feet.

The sports of the infantry are of a totally different nature. The last time I had an opportunity of being present at a *tamasha* of this kind was a pleasant breezy day on the banks of the Ganges. A space about twelve yards by fifteen was prepared by picking up and softening the ground till it presented the appearance of a minute portion of Rotten Row. One side of this space was reserved for the European officers and their friends; while round the other three stood or squatted the *sepoys* and any of their acquaintances from the neighbouring villages whom they chose to invite. In the rear were booths, whose owners were doing a brisk trade in native sweetmeats, while some twenty tom-toms kept up a discordant and never-ending din. Every native present, from *havildar* to *sepo*y, was clothed only in the *langoti* or loin-cloth, to give free play to the muscles of the limbs and chest. At each corner of the arena stood a man in authority, like a Master of the Ceremonies, to see that the sports were carried on in a proper manner and that nobody allowed his temper to get the better of him. One of these was a remarkably fine-looking man, who, had he been of somewhat lighter hue and clothed in the garments of civilisation, might have passed as an English aristocrat of the first-water; while another, of powerful build and with mutton-chop whiskers, was the very image of an eminent City man of my acquaintance.

We arrived on the scene a little late, but were

immediately shewn to a seat, one of the native officers coming up to hand us a plateful of cut-up almonds and cocoa-nut, with raisins and spices intermixed. Of course we took some, as this was the native welcome. We were hardly seated when two wiry-looking young men stepped into the arena. First, they each bent down and raised to the forehead a little earth in the right hand. This was *ponjah*, or a request for help from their deity in the approaching struggle; though I suspect in most cases it was a meaningless performance; for I saw a little Christian boy who played first-cornet in the band, go through the same manoeuvre. The two wrestlers then went to opposite corners, and began some of the queerest antics I ever saw, slapping their chests, thighs, and arms; first hopping on the left, then on the right foot; bending over and jumping back, and recalling in some degree the movements of the ballet; and then, after a few feints, they clutched each other by the arms close to the shoulder, while their two bullet-heads met together and acted as battering-rams. This went on till one man presented a chance by incautiously lifting his foot, when down he went in a trice, his adversary falling on him. This, however, was not a 'fall.' While on the ground, they turned and twisted and writhed like snakes, their lean legs curling round each other in a manner marvellous to behold, their efforts being greeted every now and then by applause, led by the Masters of the Ceremonies aforesaid, given in a sing-song way, and always ending in a long-drawn 'Tee' (Victory). It was almost wearisome to watch them, until at length the bout was brought to an end by one man being fairly thrown on his back, his adversary keeping clear. This was a true 'fall.'

Couple after couple set to in the same way, sometimes a raw youth requiring the friendly admonition of the watchful M. C. to make him keep his temper, though I must say the friendly way in which these exceedingly rough sports were carried on was deserving of the highest praise.

I could hardly believe my eyes when I saw the aristocrat and the nuttun-chop whiskers man, throwing aside their dignity, enter the arena and go through the same antics, the latter's pirouettes and *pas de Zéphir* resembling the gambols of a young elephant; but nevertheless they went through the affair as their predecessors had done.

Between times the little boys from the neighbouring villages would rush in as they saw their opportunity, and seizing a long sword with a handle that covered the arm to the elbow make cuts and points innumerable at a supposed enemy, dancing the while, and never leaving the spot where they commenced. The meaning of this I could not divine, but it pleased the spectators, for they did not withhold their applause, the aristocrat himself on one occasion prolonging the usual 'Tee' in a sonorous voice after every one else had finished.

I was told that this sort of thing went on from early morning till sunset; but though interesting for an hour, it soon begins to pall on the ordinary European; so, after seeing a little single-stick and club practice, excellent of their kind, we took our departure.

I think nothing can speak better for the class of men we have in our native army than the genuine interest they take in these thoroughly manly sports. While engaged in them, the habitual mark

of deference worn by the native soldier in the presence of his officer drops from his face, and we can see him as he is, with all his keen appreciation of fun and skill, in which he is not one whit behind his white comrade in the regular army.

A PROMISING FIELD FOR EMIGRANTS.

AMONG the colonial papers just laid before parliament will be found an account, by the governor of Tasmania, of a tour recently made by him, in company with the Minister of Lands and Works, through the north-eastern and eastern districts of that very fine island, worthy to be called the England of the southern hemisphere, which seem to us to meet the requirements of the class of emigrants alluded to; and it is to these localities that the following brief notes refer.

The north-eastern districts of Tasmania are only now attracting general attention, owing to the recent discoveries of tin; and Mr Weld undertook his long journey on horseback because he was desirous of seeing for himself enough to enable him to judge of their capabilities both as mining and agricultural districts. The result, as will be seen, sufficed to convince him that the future of Tasmania will be materially affected by the development of these regions. The north-eastern corner of the island is chiefly hilly, and even mountainous; but it contains large tracts estimated at fully seventy thousand acres of undulating and almost level land of very superior quality, and the soil of a great part of the hills themselves is exceedingly rich. Mr Weld describes the country as being almost entirely clothed with the most luxuriant vegetation. The Eucalypti on the flats and rich hill-sides attain a great size; and the valuable blackwood, the native beech or myrtle, the silver wattle (*Acacia dealbata*), the sassafras, and the tree-ferns and climbers, add beauty to the forest. The tree-ferns are most remarkable for the great profusion and luxuriance with which they grow, reaching occasionally a height of thirty feet, and being thickly spread over the whole district.

The region, Governor Weld says, may be described from a settler's point of view as a 'poor man's country;' that is, it is best adapted for settlement by men who will labour with their own hands, and who have sons and daughters to work with them. The following anecdote is suggestive, and is worthy of reproduction in its entirety: 'In the heart of the district I remained a day at the comfortable homestead of a most respectable settler, a native of Somersetshire, named Fry, who, with the assistance of his wife, four sons, and five daughters, had in eight years cleared and laid down in grass about two hundred and fifty acres of the three hundred acres he owns, milks fifty cows, and lately obtained a prize for cheese at the Melbourne Exhibition. I could not but be struck at the indomitable energy of this family, which had penetrated alone into a then pathless forest, and attacked its huge trees

with such determination, doing everything for themselves, working hard all day, and at night taught lessons, prayers, and even music by the father.' Capitalists, Mr Weld adds, would find such a country too expensive to clear; but the man who can always be cutting down or ringing a tree himself, by degrees sees the light of day break largely into the forest, and though he will not make a fortune, he will make a home and an independence, and all his simple wants will be supplied.

The district alluded to is capable of keeping thousands of such families in health and plenty. Surely then we are right in looking upon this as a promising field for the class of emigrants of which we have spoken. In addition too to its capabilities from an agricultural point of view, the country is not without mineral wealth; and a region roughly estimated at some fifteen hundred square miles, and but partially prospected, has been found to contain tin in such quantities as to warrant its being called 'a rich tin-bearing country.' Fair profits are being made in working this mineral; some of the claims are worked by men on their own account, others in part by working proprietors and in part by men employed by them on wages; and again there are two or three companies of capitalists employing managers and labourers. Labour is scarce and dear, and labourers are being imported from Melbourne; wages range from fifty shillings a week for the best labourers downwards; and on farms men get twenty shillings a week and rations. The great difficulty the north-eastern districts labour under is want of roads; the tin has consequently to be carried—at a cost of ten to thirteen pounds a ton—to Bridport on the north and George's Bay on the eastern coast, on the backs of horses, by bush-tracks over steep hills and across ravines and water-courses. The population is at present comparatively sparse, but there cannot be much doubt that it will rapidly increase as means of communication improve; and steps are already being taken to that end as far as the limited resources of the colony will allow.

On the east coast, Governor Weld saw some fine land, good farms, and neat villages, especially in the Fingal and Avoca districts; but as a rule he considers that this region is more remarkable for climate and scenery than for any continued extent of good land; coal exists in this part of the colony, and there are some fine stone quarries at Prosser's Bay, from which the Melbourne post-office was built.

In conclusion, and to render our brief remarks regarding this colony as a field for emigration more complete, we add the opinion expressed with respect to the stretch of country lying between the Ramsay River and the west coast of the island, by Mr Charles P. Sprent, who was sent to examine it in the spring of last year. He thinks that it is of little use for agricultural purposes, and that it does not contain any large amount of valuable timber; but he adds in his Report to the colonial government, there are sure indications that this part of Tasmania abounds in mineral wealth, although it may be that the search will be arduous and slow. As in the case of the Hellyer River, so it is with the Pieman; wherever the softer schists occur, gold is found in small quantities; and Mr Sprent has not the slightest doubt that in both rivers

gold will be found in paying quantities, both alluvial and reef gold. Tin and gold occurring together in some spots near the Pieman in what is called 'made' ground, would indicate that the country higher up the river is worthy of examination, and he would recommend prospectors to try the neighbourhood of Mount Murchison and the Murchison River. As an inducement to prospecting the western country, it may be mentioned that over three hundred ounces of gold have been obtained in one season from the Hellyer River, and that a party of Chinamen have done exceedingly well there since that time. Copper has been discovered on the Arthur River in several places; and copper, lead, tin, gold, and platinum have been found in the vicinity of the Parson's Hood and River Pieman, not to mention the discoveries at Mount Bischoff and Mount Ramsay.

The Report upon which this brief account is mainly based will be found in 'Papers relating to Her Majesty's Colonial Possessions, Part I. of 1876,' which may be obtained from the offices for the sale of Parliamentary Papers. The agents of the Board in London are 'The Emigrants' and Colonists' Aid Corporation (Limited),' 25 Queen Anne's Gate, Westminster, to whom all applications for 'Land Order Warrants,' as well as general information about the colony, should be made.

'EVER BELIEVE ME AFFECTIONATELY YOURS.'

Ever believe you true? Dear friend,
Your words so precious are that I
Can but repeat them o'er and o'er,
And kiss the paper where they lie.
How shall I thank you for this pledge,
This sweet assurance, which destroys
The doubt that you my love repaid,
And changes all my fears to joys?

Ever believe you true? I will!
I hold you to this written gage!
This shall console me, now you're gone;
Still next my heart I'll bear the page;
By day and night, where'er I go,
It shall my prized companion be;
And if a thought would 'gainst you rise,
This from all blame shall set you free.

Ah, need I say, believe me true?
You know how tender, yet how strong,
This heart's emotions are, how half
Of all its throbs to you belong;
How fain 'twould burst its prison-walls
To nestling beat against your own;
How joyous 'twas when you were near,
How sadly yearning, now, alone.

Ay, till the weary life is done,
Though we again may never meet,
Let's not forget the by-gone days
That like a dream passed, swift and sweet;
Still let thy knowledge of my love
Thy faith in humankind renew,
Let that great love still for me plead,
And, to the last, believe me true!

FAITHFUL UNTO DEATH.

THE fire burns cheerily on the hearth, the great logs crackle and flare up the wide chimney, up which it is my wont to say you could drive a coach-and-four. I draw my chair nearer to it with a shiver. 'What a night!' I say.

'Is it still snowing?' asks my wife, who sits opposite to me, her books and work on the table beside her.

'Fast. You can scarcely see a yard before you.'

'Heaven help any poor creature on the moor to-night!' says she.

'Who would venture out? It began snowing before dark, and all the people about know the danger of being benighted on the moor in a snow-storm.'

'Yes. But I have known people frozen to death hereabouts before now.'

My wife is Scotch, and this pleasant house in the Highlands is hers. We are trying a winter in it for the first time, and I find it excessively cold and somewhat dull. Mentally I decide that in future we will only grace it with our presence during the shooting season. Presently I go to the window and look out; it has ceased snowing, and through a rift in the clouds I see a star.

'It is beginning to clear,' I tell my wife, and also inform her that it is past eleven. As she lights her candle at a side-table I hear a whining and scratching at the front-door.

'There is Laddie loose again,' says she. 'Would you let him in, dear?'

I did not like facing the cold wind, but could not refuse to let in the poor animal. Strangely enough, when I opened the door and called him, he wouldn't come. He runs up to the door and looks into my face with dumb entreaty; then he runs back a few steps, looking round to see if I am following; and finally, he takes my coat in his mouth and tries to draw me out.

'Laddie won't come in,' I call out to my wife. 'On the contrary, he seems to want me to go out and have a game of snow-ball with him.'

She throws a shawl round her and comes to

the door. The collie was hers before we were married, and she is almost as fond of him, I tell her, as she is of Jack, our eldest boy.

'Laddie, Laddie!' she calls; 'come in, sir.' He comes obediently at her call, but refuses to enter the house, and pursues the same dumb pantomime he has already tried on me.

'I shall shut him out, Jessie,' I say. 'A night in the snow won't hurt him;' and I prepare to close the door.

'You will do nothing of the kind!' she replies with an anxious look; 'but you will rouse the servants at once, and follow him. Some one is lost in the snow, and Laddie knows it.'

I laugh. 'Really, Jessie, you are absurd. Laddie is a sagacious animal, no doubt, but I cannot believe he is as clever as that. How can he possibly know whether any one is lost in the snow, or not?'

'Because he has found them, and come back to us for help. Look at him now.'

I cannot but own that the dog seems restless and uneasy, and is evidently endeavouring to coax us to follow him; he looks at us with pathetic entreaty in his eloquent eyes. 'Why won't you believe me?' he seems to ask.

'Come,' she continues; 'you know you could not rest while there was a possibility of a fellow-creature wanting your assistance. And I am certain Laddie is not deceiving us.'

What is a poor hen-pecked man to do? I grumble and resist and yield; as I have often grumbled and resisted and yielded before, and as I doubtless often shall again.

'Laddie once found a man in the snow before, but he was dead,' Jessie says, as she hurries off to fill a flask with brandy, and get ready some blankets for us to take with us. In the meantime I rouse the servants. They are all English, with the exception of Donald the gardener, and I can see that they are scoffingly sceptical of Laddie's sagacity, and inwardly disgusted at having to turn out of their warm beds and face the bitter winter's night.

'Dinna trouble yersels,' I hear old Donald say.

'The mistress is right enough. Auld Laddie is cleverer than mony a Christian, and will find something in the snaw this night.'

'Don't sit up, Jessie,' I say as we start; 'we may be out half the night on this wild-goose chase.'

'Follow Laddie closely,' is the only answer she makes.

The dog springs forward with a joyous bark, constantly looking back to see if we are following. As we pass through the avenue gates and emerge on to the moor, the moon struggles for a moment through the driving clouds, and lights up with a sickly gleam the snow-clad country before us. 'It's like looking for a needle in a bundle of hay, sir,' says John the coachman confidentially, 'to think as we should find anybody on such a night as this! Why, in some places the snow is more than a couple o' feet thick, and it goes again' reason to think that a dumb animal would have the sense to come home and fetch help.'

'Bide a wee, bide a wee,' says old Donald. 'I dinna ken what your English dugs can do; but a collie, though it hasna been pleasing to Providence to give the creatur the gift o' speech, can do mony mair things than them that wad deride it.'

'I ain't a deridin' of 'em,' says John. 'I only say as how if they be so very clever, I've never seen it.'

'Ye wull, though, ye wull,' says old Donald, as he hurries forward after Laddie, who has now settled down into a swinging trot, and is taking his way straight across the loneliest part of the bleak moor. The cold wind almost cuts us in two, and whirls the snow into our faces, nearly blinding us. My finger-tips are becoming numbed, icicles hang from my moustache and beard, and my feet and legs are soaking wet, even through my shooting-boots and stout leather leggings.

The moon has gone in again, and the light from the lantern we carry is barely sufficient to shew us the inequalities in the height of the snow, by which we are guessing at our path. I begin to wish I had staid at home. '*L'homme propose, mais la femme dispose*,' I sigh to myself; and I begin to consider whether I may venture to give up the search (which I have undertaken purely to satisfy my wife, for I am like John, and won't believe in Laddie), when suddenly I hear a shout in front of me, and see Donald, who has all the time been keeping close to Laddie, drop on his knees and begin digging wildly in the snow with his hands. We all rush forward. Laddie has stopped at what appears to be the foot of a stunted tree, and after scratching and whining for a moment, sits down and watches, leaving the rest to us. What is it that appears when we have shovelled away the snow? A dark object. Is it a bundle of rags? Is it—or alas! was it a human being? We raise it carefully and tenderly, and wrap it in one of the warm blankets with which my wife's forethought has provided us. 'Bring the lantern,' I say hastily; and John holds

it over the prostrate form of, not as we might have expected, some stalwart shepherd of the hills, but over that of a poor shrivelled, wrinkled, ragged old woman. I try to pour a little brandy down the poor old throat, but the teeth are so firmly clenched that I cannot.

'Best get her home as quickly as may be, sir; the mistress will know better what to do for her nor we do, if so be the poor creaturo is not past help,' says John, turning instinctively, as we all do in sickness or trouble, to woman's aid.

So we improvise a sort of hammock of the blankets, and gently and tenderly the men prepare to carry their poor helpless burden over the snow.

'I am afraid your mistress will be in bed,' I say, as we begin to retrace our steps.

'Never fear, sir,' says Donald with a triumphant glance at John; 'the mistress will be up and waitin' for us. She kens Laddie didna bring us out in the snaw for naething.'

'I'll never say nought about believing a dawg again,' says John, gracefully striking his colours. 'You were right and I was wrong, and that's all about it; but to think there should be such sense in a animal passes me!'

As we reach the avenue gate I despatch one of the men for the doctor, who fortunately lives within a stone's-throw of us, and hurry on myself to prepare my wife for what is coming. She runs out into the hall to meet me. 'Well?' she asks eagerly.

'We have found a poor old woman,' I say; 'but I do not know whether she is alive or dead.'

My wife throws her arms round me and gives me a great hug.

'You will find dry things and a jug of hot toddy in your dressing-room, dear,' she says; and this is all the revenge she takes on me for my scepticism. The poor old woman is carried upstairs and placed in a warm bath under my wife's direction; and before the doctor arrives she has shewn some faint symptoms of life; so my wife sends me word. Dr Bruce shakes his head when he sees her. 'Poor old soul,' he says; 'how came she out on the moor on such a fearful night? I doubt she has received a shock, which at her age she will not easily get over.'

They manage, however, to force a few spoonfuls of hot brandy-and-water down her throat; and presently a faint colour flickers on her cheek, and the poor old eyelids begin to tremble. My wife raises her head and makes her swallow some cordial which Dr Bruce has brought with him, and then lays her back among the soft warm pillows. 'I think she will rally now,' says Dr Bruce, as her breathing becomes more audible and regular. 'Nourishment and warmth will do the rest; but she has received a shock from which, I fear, she will never recover;' and so saying, he takes his leave.

By-and-by I go up to the room and find my wife watching alone by the aged sufferer. She looks

up at me with 'tears in her eyes. 'Poor old soul,' she says; 'I am afraid she will not rally from the cold and exposure.'

I go round to the other side of the bed and look down upon her. The aged face looks wan and pinched, and the scanty gray locks which lie on the pillow are still wet from the snow. She is a very little woman, as far as I can judge of her in her recumbent position, and I should think must have reached her allotted threescore years and ten. 'Who can she be?' I repeat wonderingly. 'She does not belong to any of the villages hereabouts, or we should know her face; and I cannot imagine what could bring a stranger to the moor on such a night.'

As I speak a change passes over her face; the eyes unclose, and she looks inquiringly about her. She tries to speak, but is evidently too weak. My wife raises her, and gives her a spoonful of nourishment, while she says soothingly: 'Don't try to speak. You are among friends; and when you are better you shall tell us all about yourself. Lie still now and try to sleep.'

The gray head drops back wearily on the pillow; and soon we have the satisfaction of hearing by the regular respiration that our patient is asleep.

'You must come to bed now, Jessie,' I say. 'I shall ring for Mary, and she can sit up for the remainder of the night.' But my wife, who is a tender-hearted soul and a born nurse, will not desert her post; so I leave her watching, and retire to my solitary chamber.

When we meet in the morning I find that the little old woman has spoken a few words, and seems stronger. 'Come in with me now,' says my wife, 'and let us try to find out who she is.' We find her propped into a reclining posture with pillows, and Mary beside her feeding her.

'How are you now?' asks Jessie, bending over her.

'Better, much better; thank you, good lady,' she says in a voice which trembles from age as well as weakness. 'And very grateful to you for your goodness.'

I hear at once by the accent that she is English. 'Are you strong enough to tell me how you got lost on the moor, and where you came from, and where you were going?' continues my wife.

'Ah! I was going to my lad, my poor lad, and now I doubt I shall never see him more,' says the poor soul, with a long sigh of weariness.

'Where is your lad, and how far have you come?'

'My lad is a soldier at Fort-George; and I have come all the way from Liverpool to see him, and give him his old mother's blessing before he goes to the Indies.' And then, brokenly, with long pauses of weariness and weakness, the little old woman tells us her pitiful story.

Her lad, she tells us, is her only remaining child. She had six, and this, the youngest, is the only one who did not die of want during the Lancashire cotton famine. He grew up a fine likely boy, the comfort and pride of his mother's heart, and the stay of her declining years. But a 'strike' threw him out of work, and unable to endure the privation and misery, in a fit of desperation he 'listed.' His regiment was quartered at Fort-George, and he wrote regularly to his mother, his letters getting more cheerful and hopeful every day; until suddenly he wrote to say that his

regiment was ordered to India, and begging her to send him her blessing, as he had not enough money to carry him to Liverpool to see her. The aged mother, widowed and childless, save for this one remaining boy, felt that she *must* look on his face once more before she died. She begged from a few ladies, whose kindness had kept her from the workhouse, sufficient money to carry her by train to Glasgow; and from thence she had made her way, now on foot, now begging a lift in a passing cart or wagon, to within a few miles of Fort-George, when she was caught in the snow-storm; and wandering from the road, would have perished in the snow—but for Laddie.

My wife is in tears, and Mary is sobbing audibly as the little old woman concludes her simple and touching story; and I walk to the window and look out for a moment, before I am able to ask her what her son's name is. As I tell her that we are but a few miles from Fort-George, and that I will send over for him, a smile of extreme content illumines the withered face. 'His name is John Salter,' she says; 'he is a tall handsome lad; they will know him by that.'

I hasten down-stairs and write a short note to Colonel Freeman, whom I know intimately, informing him of the circumstances, and begging that he will allow John Salter to come over at once; and I despatch my groom in the dogcart, that he may bring him back without loss of time. As I return to the house after seeing him start, I meet Dr Bruce leaving the house.

'Poor old soul,' he says; 'her troubles are nearly over; she is sinking fast. I almost doubt whether she will live till her son comes.'

'How she could have accomplished such a journey at her age, I cannot understand,' I observe.

'Nothing is impossible to a mother,' answers Dr Bruce; 'but it has killed her.'

I go in; but I find I cannot settle to my usual occupations. My thoughts are with the aged heroine who is dying up-stairs, and presently I yield to the fascination which draws me back to her presence.

As Dr Bruce says, she is sinking fast. She lies back on the pillows, her cheeks as ashy gray as her hair. She clasps my wife's hand in hers, but her eyes are wide open, and have an eager expectant look in them.

'At what time may we expect them?' whispers my wife to me.

'Not before four,' I answer in the same tone.

'He will be too late, I fear,' she says; 'she is getting rapidly weaker.'

But love is stronger than death, and she *will* not go until her son comes. All through the winter's day, she lies dying, obediently taking what nourishment is given to her, but never speaking except to say: 'My lad, my lad! God is good; He will not let me die until he comes.'

And at last I hear the dogcart. I lay my finger on my lip and tell Mary to go and bring John Salter up very quietly. But my caution is needless; the mother has heard the sound, and with a last effort of her remaining strength, she raises herself and stretches out her arms. 'My lad, my lad!' she gasps, as with a great sob, he springs forward, and mother and son are clasped in each other's arms once more. For a moment they remain so. Then the little old woman sinks back

on my wife's shoulder, and her spirit is looking down from Heaven on the lad she loved so dearly on earth.

She lies in our little churchyard under a spreading yew-tree, and on the stone which marks her resting-place are inscribed the words, 'Faithful unto Death.' Our Laddie has gained far-spread renown for his good works; and as I sit finishing this short record of a tale of which he is the hero, he lies at my feet, our ever watchful, faithful companion and friend.

THE BRITISH ANGLER ON THE CONTINENT.

It is a curious delusion, especially among writers of guide-books, that when an Englishman crosses the Channel and takes up his abode as a traveller in a strange country, he thereupon necessarily ceases to care for that truly English pastime, angling. The sportsman is expected to become a connoisseur of architecture, to delight in nothing but sweet or majestic landscapes, or to feel unwonted pleasure in a continual series of mountain walks. That some such delusion must exist is shewn by the persistent manner in which hundreds of persons who at home are ardent fishermen, and who would gladly take a holiday in Hampshire or seek some Scottish river, pass by the excellent streams and lakes which abound throughout the continent. The angler, with a martyr-like resignation, thinks only with a sigh of the trout feeding beneath the old gray willow-tree at home, but never attempts to try that skill in foreign waters which practice from boyhood has often rendered almost perfect. It is singular indeed how fishing is neglected on the continent by those who would find it a renewed pleasure; for in whatever land it may be pursued, no amusement is more refreshing to the brain-worker, with its variation of gentle or strong exercise, and its pleasant alternations of monotony and excitement.

A combination of fishing and travelling has the important advantage of rendering the traveller quite independent of that bugbear of all tourists, bad weather. In after-days he can call to mind how he has often seen the regular routine traveller pacing the *salon* of his hotel when the mists were rolling along the mountain-side and the passer-by in the valley was drenched with rain, whilst he was setting forth for a day among the grayling in some rushing Tyrolese stream, or pondering upon those charming and descriptive lines of Sir Henry Taylor's; and he will feel, we should hope, that not the least pleasurable days which the travelling angler meets with, have been those when the trout lay satily sunning themselves in the clear water:

The peaks are shelved and terraced round;
Earthward appear in mingled growth
The mulberry and maize; above
The trellised vine extends to both
The leafy shade they love;
Looks out the white-walled cottage here;
The lovely chapel rises near:

Far down the foot must roam to reach
The lovely lake and bending beach;
While chestnut green and olive gray
Chequer the steep and winding way.

The number of those who ever cast a thought to the obtaining of their favourite amusement when they have left Dover behind them, is singularly small, or who seek to vary the regular tourist's round by a day or two by the side of some little stream where the inhabitants look upon a fishing-rod as quite an unusual phenomenon. And yet many a man who, as he drives along a Tyrolese valley or passes a sombre lake shaded by pine-trees, must involuntarily recall pleasant days spent by some Highland stream. The river ripples by the roadside, the trout are 'on the feed;' but flies and fishing-rod are safe at home, and the alpen-stock alone is at hand!

But if angling is a fascinating pastime to numbers of thoughtful minds among the familiar scenes of an English landscape, it becomes even more attractive, at anyrate for a time, when practised amid the scenery of a country new to the beholder. The angler finds many features in the landscape, charming perhaps in their minuteness, which the through-going traveller, who rushes quickly from place to place, can never enjoy. Nor are the opportunities of mixing with the various country-folks to be lightly prized; for the increasing number of large hotels, the numerous railways, and improved systems of travelling, not to speak of the numbers of actual travellers, render a leisurely acquaintance with the natives more and more difficult. And it must always be a pleasure to look back to the quaint, honest, and kindly folk with whom the traveller would never have come in contact had he left his rod and tackle at home.

We can remember a professional fisherman whose acquaintance we made one afternoon in a distant hamlet on an Alpine pass, from which the mighty mass of the Ortler Spitze could be seen glowing under the beams of the setting sun. The sporting instincts of this man were small, and like most foreigners, he looked upon fish solely as an article of food or merchandise. But how ready was he to explain every little detail that we inquired about; how genuinely pleased by the present of a few English flies; and how gratified to be asked for a brace of his own singular specimens of the fly-maker's art. Nor can the quaint stout landlord in the Black Forest be forgotten, who took such an ardent pleasure in telling of the manifold advantages of large hooks and a powerful line in order to haul the pike into the boat with as little of what an English angler would term 'play' as possible.

The fisherman intent on angling for angling's sake only, can obtain excellent sport with trout or grayling in the valleys of the Salzkammergut or in the Bavarian Highlands. Or among the orchards of Normandy when they are in their spring-tide bloom. No reasonable angler indeed can wish

for better. But he who, besides being a lover of the gentle art, has a soul for scenery and a relish for the vicissitudes of travel, has advantages indeed. When tired of wielding his rod he turns to enjoy natural beauty under every mood—in its wildest or its most tranquil aspects. And he is ready, like De Quincey, to fraternise with and to observe every kind of man. He will, moreover, be one who, if works of art fall in his way, can find in reiterated views reiterated enjoyment. For if you find him in Normandy in quiet Evreux, fishing for the well-fed trout in the gently flowing, poplar-lined Iton, he will be paying frequent visits to the Gothic cathedral with a pleasure which increases every time he leaves the Hôtel du Cerf. When he is in the Black Forest, he knows that unless he puts himself *en rapport* with the simple husbandmen and industrious clockmakers of the Schwarzwald he cannot thoroughly enjoy himself; and as he walks through the meadows after a day on the Schluch See, he will feel that his landlord is his friend. Indeed, this kindly feeling which grows up between the travelling fisherman and those whom he meets, is one of the pleasantest features of this mode of holiday-making.

One of the great drawbacks to modern travel is the fact that only a few common features in the mere outward lives of the people, are observed; and even of their habits but few can really be properly gleaned by the passing traveller. The self-inflicted melancholy and unfortunate reserve of most English travellers is also a strong barrier against familiar intercourse with foreigners. John Bull has not yet acquired the secret of enjoyable outing, and gets but a poor return for his money. Certainly modern travellers would do well to notice how Dorothy Wordsworth, for instance, and her brother the poet associated with those among whom they travelled; how Dr Johnson would converse as readily with a gillie as he would argue with a Presbyterian minister; how Christopher North made the most of—Streams.

To enjoy to the full a travelling and angling tour, some familiarity with or some power of conversing in foreign languages—French, German, or Italian, all three if possible—is important. Of course, if you are staying at a place like St Moritz in the Engadine, where you find there is trout-fishing, and where English is spoken at all the hotels, you have little need for any language except your native tongue; though even then you are debarred from all conversation with the peasants or the fishermen. But it will also be found that the best angling, the most picturesque scenes, and the most economical inns, are in by-ways away from the main travelling lines; and that the best fishing stations are frequently by the side of some little frequented river, or on the banks of some solitary lake.

The choice of a companion is one of the most difficult matters, when you are projecting a fishing tour. Many an ardent angler is not satisfied unless he is *continually* throwing his fly or trolling his minnow; but as we have already hinted, the genuine travelling angler must have a mind capable of enjoying other things besides fishing. He must also be prepared for disappointments; for it is a different thing to go wandering along the course of say the Salzach or the Inn, to

stationing yourself at places such as Glendalough, or Loch Tay, or Loch Leven, where you have only to pay your money and catch or try to catch your fish. Again of two friends, if one possesses the instincts and aspirations of the mountaineer only, and the other those of the fisherman only, it is unlikely that the tour will be a success.

No two persons suit each other better for a foreign piscatorial tour than an artist and an angler; for both find materials for their skill. Where David Cox could find materials for his pencil such as we see in the grand picture of the 'Salmon Trap,' the follower of Izaak Walton will assuredly not be without hope in the exercise of his delicate craft. Nor are ladies, if with proper tastes, unsuitable companions for the angling traveller. Even if they do not actually possess in common some taste such as painting, yet still sketching and fishing, or fishing and walking, or simply fishing and quiet travelling, can well be combined, provided each possesses a fair share of that cardinal virtue of all travellers—*forbearance*. Thus, with a moderate capability of walking, we see nothing to prevent a brother and a sister, or a husband and a wife, from pleasantly enjoying a tour that shall include angling.

None of the usual guide-books give any information upon the subject of continental fishing; and therefore it must be found out in the first instance whether some village or valley is a likely centre for the angler; and often it proves that some half-way posting inn is the very best station for his purpose. But if some amount of walking is undertaken, and the angler be of an inquiring disposition, there is no fear of overlooking any stream or lake by the wayside.

There is yet another pleasing attraction for the traveller who angles as he goes. This may be termed the natural history attraction; for not only are fresh varieties of fish made familiar to the angler to whom the trout, or grayling, or pike of his home serve as the personification of all freshwater fish, but even new varieties of these fish are observed under entirely new conditions; and no fisherman of any intelligence who happens to spend a few days among the lakes of the Eastern Alps, will fail to make the acquaintance of that excellent fish, the coregonus. In speaking of this fish, Mr Francis Francis, a well-known writer on angling subjects, tells us that 'where varieties caused by water and locality are as plentiful as the lakes, where the distinctive differences between the fish themselves are but small, and where names are legion, the confusion is so great, that nothing but the utmost patience and perseverance, combined with large opportunities and the staunchest assistance, can ever hope to settle such moot-points as these questions of the identity of some fish with others. The coregoni are therefore as yet very much unexplored and debatable ground with naturalists.' We may add that intelligent and trustworthy observations by anglers are at all times of value, and that in addition to its many other charms, a fishing tour may fairly be said to be a directly instructive and intellectual pleasure, each successive fact that is stored up in the memory opening out yet another to the searching mind, and serving to prevent a captivating amusement from degenerating into a mere pot-hunting pursuit.

In the more mountainous districts, it is remarkable how many curious and characteristic legends may be found connected with different lakes. In the Tyrol especially, which is the beau-ideal of the angling traveller's holiday-ground, innumerable legends are to be found connected with every dark mountain lake or tarn. There is, for instance, a lake well known to many Swiss travellers who leave the usual route of tourists up or down the Lake of Lucerne, and rest for a while in the village of Seelisberg, situated above the spot where the confederates are supposed to have taken the oath which was the foundation of the Swiss Republic. Above this again, sheltered by the dark precipices of the Niederbauen, is the Seelisberger See, of which there is a legend that in it dwells a monster known as the Elbst. This beast can, Proteus-like, change its form, and the unconfiding swimmer resting, as he supposes, on the floating trunk of a fallen pine, is engulfed for ever in the waters of the lake. Thus, if one is not inattentive to the stories of the mountaineer, the angler may store his mind with much of the picturesque and characteristic folk-lore of the Alps.

Not a little of the charm of a fishing-tour arises, or ought to arise, from its leisurely character. But, as we have already hinted, the feverish anxiety to hurry from place to place which seems to characterise the fashion of travelling nowadays, precludes the traveller from enjoying any one place thoroughly. 'If,' he says to himself, 'I could shoot or fish it might be different.' Therefore it is that we would point to what we might almost term a new continental amusement, whereby the traveller may combine the recreation of good old Izaak Walton with the harder toil of the mountaineer, or the more sober pleasures of the botanist and the artist, to the increase of the enjoyment to be derived from each one of these pastimes.

It would be out of place here to enter into details concerning the equipment of the travelling fisherman. All we would now point out is that those flies which are useful in a Scotch or Welsh stream or on an Irish lake, are, as a rule, equally servicable in a Swiss river or a Tyrolean lake. And the only important fact to bear in mind is, that the supply of flies should be tolerably large, though not necessarily very varied in kind, for the art of fly-making is not well known on the continent.

To point out localities for the fisherman would necessitate a geographical ramble over Europe; moreover, as it is the object of this paper to shew that fishing can be combined with most of the ordinary amusements of the general traveller, no special district need be sought for. It is sufficient here to mention the rivers of Normandy and Brittany, of the Vosges and the Ardennes for spring fishing; and the waters of Wurtemberg, Bavaria, and Austria for sport later in the year. In the mountain district, for example, popularly called the Tyrol, the rivers are full of grayling, so that the autumn, far from being a blank time for the angler, will, even after the trout are becoming somewhat out of season, afford him excellent sport. And in the Tyrol especially are the inhabitants simple and hospitable in the extreme; the scenery of their country is characterised by extremes of wildness and softness, such, for instance, as the bleak grandeur of the distant

end of the Königs See, and the softer beauties of the valley of the Alm. Though the ramifications of travel are everywhere spreading, it is never likely that in the lifetime of the present generation at least, the travelling angler, whose ways lie out of the beaten track, will be disturbed by any except a few kindred spirits.

THE LAST OF THE HADDONS.

CHAPTER XXX.—MRS TRAFFORD'S HAPPINESS.

ALTHOUGH the precise date for our wedding-day was not as yet decided upon, it was tacitly understood that the orthodox preparations were being carried on for it so far as depended upon milliners and dressmakers. I did not think it necessary to explain to Mrs Tipper and Lilian that the little I had to spend for the purpose was already spent. And indeed I, considered that I had a quite sufficient wardrobe for a portionless bride, without trespassing upon their generosity, which I knew would be brought into play by the slightest hint of a want on my part.

We made the most of the departing summer days; Lilian and I sufficiently occupied to satisfy our consciences and add a piquancy to idleness. After our morning rambles, visits to the cottages, and an early dinner, we betook ourselves to the woods, where Philip read to us whilst Lilian and I worked. And sometimes we went farther afield, devoting the day to exploring the adjacent country, picnicing in the most lovely spots, and filling our sketch-books. In the evenings there was music and the frequent visits of Robert, with delightful conversation, in which we all aired our pet theories without any jar in the concord—a quartet in which each played a different part to make a harmonious whole.

Nevertheless our summer sky was not entirely free from clouds. Mr Wyatt—whose attentions to Lilian had latterly been most marked—could not be made to understand that there was no hope for him; whilst Lilian could not be made to believe that her aunt and I were correct in our surmise respecting the cause of his so frequently finding his way in the direction of the cottage. But there came a day when he found courage to challenge fortune and make his hopes known to her. He had joined us in one of our rambles, and I suppose she felt a little hesitation about separating Philip and me, as well as the natural dread which a delicately minded girl feels of appearing to suppose that love-making must necessarily follow being alone with a gentleman for a few minutes, and so gave Mr Wyatt the opportunity he had been seeking.

We lost sight of them for a short time, and I gave Philip a hint of what I suspected to be the cause of Mr Wyatt detaining Lilian.

'Love her!' he ejaculated, stopping short and staring at me in the greatest astonishment. 'But she does not return it—impossible! She is surely not going to throw herself away like that!'

'I do not think there would be any throwing away in the case, Philip. Mr Wyatt is a good

man, and a gentleman. The real difficulty is that Lillian does not care for him in any other way than as a friend, and she never will.' At which Philip hastened to make the *amende*.

'I ought not to have spoken in that way, Mary. Of course he is a good fellow—for any one else's husband.'

'I could not help smilingly agreeing to that. It was ever so much more agreeable to think of Mr Wyatt as the husband of any other than Lillian. When she presently returned alone, looking very grave and regretful, walking silently home with us, we knew that Mr Wyatt had been answered. Fortunately his was a nature not difficult to be consoled; and it so happened that he had a pretty cousin eager to console him. In a very short time, Lillian had the relief and pleasure of knowing that she had done him no permanent harm.

One piece of good fortune came to us, which I had been almost afraid to hope for. The house so beautifully situated, which I had so long coveted for our future home, and which was aptly named Hill Side, was to be sold. We found that the interior arrangements were all that could be desired. In an unpretending way it was the perfection of a house—one we both would choose before all others. Though not numerous, the rooms were mostly large for the size of the house; whilst, as Lillian laughingly said, my pet aversion to square rooms had been duly considered by the builder. A long drawing-room opening to a veranda'd terrace, and commanding one of the finest views in Kent, with dining-room facing in the same direction, and a delightful little morning-room, and library and study at the side; the latter possessing a special little view of its own down what was artistically made to appear a steep declivity, its sides clothed with bushes and hanging plants, and boasting a pretty running brook. You had only to make-believe a little to fancy yourself living in some wild mountainous region, when looking from the oriel window of this charming little room.

Philip was quite as enthusiastic and inclined to ignore disadvantages as were Lillian and I. Climbing the hill! Who minded climbing to reach such a nest as that! Stables for the modest little turn-out we should keep could be had in the village at the foot of the hill; and as to the distance from the railway station, shops, &c., we grandly pool-pooled all that as unimportant to two people who cared for fashion and change as little as we two meant to do. Food was to be got; and that was enough, depending for our supply of books, &c., as we should from London. The best of it was that these little drawbacks told in our favour in the purchase; being considered by most people as great disadvantages, which lowered the value of the property. Consequently Philip was able to gratify our taste at much less cost than he at first anticipated.

He at once set about the necessary negotiations for completing the purchase, planning all kinds of improvements and alterations, Lillian and I being in constant request in the consultations.

Meantime, Mr and Mrs Trafford had returned

from their wedding-tour, and we were telling each other that we meant to pay the expected visit of congratulation. But we contented ourselves as long as possible with *meaning* to pay it, being in no haste to make our appearance at Fairview again. There could never be anything stronger than politeness between either Hill Side or the cottage, and Fairview; and we did not wish to pretend that there could. But either the bride became impatient to assure us of her happiness, or she was curious to find out for herself whether the rumour, which had reached her respecting the intentions of the gentleman who visited so regularly at the cottage, was true; for she waived ceremony at last, and came to visit us—she and 'Caroline.'

Philip and Lillian and I were in consultation about the furniture for Hill Side, which we wanted to be artistic and at the same time befitting a cheerful country home. The only room we were inclined to be really extravagant about was the library; and that, I was chiefly answerable for. Philip gravely opined that I must mean to spend a great deal of my time there, and I as gravely allowed that I did. Lillian and I were to be the only ladies admitted there. I reminded him that he did not yet know Mrs Trafford and Miss Chichester, and that therefore he had better not make his rules too stringent.

We were in the midst of an animated discussion upon the respective merits of light and dark oak, when Philip drew our attention to what he termed an extraordinary collection of finery coming down the lane.

It was Mrs Trafford, her long train sweeping the dust into clouds behind her, accompanied by Mrs Chichester. It would be vain to attempt a description of her appearance, laden as she was with every conceivable folly which French and English *modistes* could invent. Perhaps Philip's comment—'Too much of everything, from the lady herself to her feathers and furbelows'—best expressed the impression her appearance gave. I saw his eyes turn for refreshment upon Lillian's simple holland dress and the delicate colouring and outline of her face. She always looked her best in contrast with Marian; the soft rose of her cheeks, the deep tender blue eyes, and the pale gold hair, in eloquent protest against the other's vivid black and white and red.

Mrs Trafford (how glad I was to be able to discontinue calling her Miss Farrar) had no misgivings. Misgivings! Was not everything she had on in the latest extreme of fashion? She evidently considered that it was for us to have misgivings; though she generously tried to make matters pleasant and set us at our ease by giving us a description of Paris and details of fashionable life there. We had no idea what Paris life was like; no one could without having been there; it was too absolutely delightful, quite too awfully charming. She positively could not exist without going every year to the enchanting place; and so forth, and so forth; all in superlative.

She made a great point too of telling us how very much 'Dear Arthur' had enjoyed the life there. 'He really was quite too enraptured, and said he had never known what enjoyment was till he had seen Paris.'

Mrs Chichester put in a word to the effect that her brother had frequently visited Paris; and the life there was not new to him. But Marian

reminded her that he had not before visited it with her, which made all the difference.

With lowered eyes, Mrs Chichester softly remarked that it doubtlessly did make a difference.

Of course it did—all the difference! 'And'—turning pleasantly to Lillian once again—'I have brought over a French maid with me: one really cannot expect to look *commy fo* without, don't you know, in these days.'

I tranquilly supposed that they could not; never again would Marian receive a home-thrust from me; though there could not be friendship, there would be no more war between us. I did not even allude to the Pratts.

'You must all come to Fairview to dinner; aunt and all, *ong fam-y* you know; you really must.' And turning to Philip, she graciously expressed a hope that Mr Dallas also would do her the honour.

Mr Dallas gravely replied that he was entirely in our hands and ready to do our bidding. At which she laughingly advised me not to take *all* that for gospel. 'You can't expect it *always* to go on like that, you know, Miss Haddon; though I am sure I have no reason to complain. No one could be more thought of than I am. You would say that if you could have seen how patiently Arthur waited for me at the shops—hours and hours, I assure you. The very worst he did was to give a little sigh sometimes, and no one could be offended at that, knowing how some of the husbands go on.—Waiting about in the shops really is a test of a husband's good-nature, Mr Dallas.'

Philip meekly supposed that it really was.

'Is it true that Mr Dallas has become the purchaser of the little place—Hill Side isn't it called?—which you can see from some part of the Fairview grounds, Miss Haddon?'

'Yes,' I replied; Philip had bought it.

'It looks a charming little place. But is it large enough?'

I said that Mr Dallas thought it large enough for his means; at which she was amiably anxious to point out the disadvantages of having a large place and the advantages of having a small one.

'A small house is so—cosy—you know, and so—warm in the winter, and all that. I sometimes almost wish I lived in a small way myself; I really do. No one would believe the expense it is to keep up a large place like Fairview; they really wouldn't. And then the trouble of having a large staff of servants! You have no *idea* what men-servants are in a house—so extravagant and expensive and lazy; it's quite *too* dreadful, my dear!'

'Really, aunt'—turning to the dear little lady placidly eyeing her—'you are the best off after all, if you could only believe it.'

'I do believe it, Mrs Trafford.'

But that was *more* than Marian could understand. 'It's very good of you to say so, I am sure, aunt; but perhaps, after all, it does seem like old times to you.'

Mrs Chichester flushed up now and then, a little out of humour; I fancied, at seeing herself thus travestied. But she said very little; indeed during the whole visit she seemed to be absorbed in one idea, so lost in astonishment at my good fortune as to be quite unlike her usual self. She was even impolitic enough to give some expression to

her astonishment in a little aside to Lillian, who was quite indignant at the implied ill compliment to me.

'You *must* say you will come and dine with us,' repeated Marian, when she at length rose to take her departure. 'You positively must! Arthur will never forgive me if I don't make you promise.—What day have we disengaged next week, Caroline?'

Caroline could not or would not recollect what day they had disengaged; a little angry probably at a smile which I could not suppress; and was chidden by her sister-in-law accordingly.

'But you ought to make a point of remembering such things, you know; and I must beg that you will do so in future,' said Mrs Trafford, with a tone and look which seemed to shew that Mrs Chichester's office was no sinecure. I think she was heartily glad when the visit was over.

'You must come up and see the things I bought in Paris,' whispered Mrs Trafford good-naturedly in a little aside to me. 'It will give you an idea of what is worn. Ask for Céleste, if I do not happen to be in the way, and I will tell her she is to shew you beforehand; for she knows how particular I am. She will put you up to all sorts of things if you make friends with her. You can't conceive how much those French maids know about improving the figure and complexion and all that; though of course I do not need anything of the kind.'

I murmured something about being obliged; not to seem ungrateful for what was evidently meant to be a kindness.

'Oh, you are quite welcome.' Then lowering her voice again: 'He is a dear! How long have you been engaged?'

'Nearly ten years.'

'Ten years!'

'Mr Dallas has been abroad some years, and has only just returned,' I said, seeing no necessity for making a mystery about it.

'And kept true to you all that time! He *must* be good! So handsome too—so *very* handsome. All the heroes in the books are big, and have broad shoulders *now*;' sentimentally. 'His beard just the right colour too! How you must dote upon him, and how jealous you must be! Between ourselves, I could hardly bear Arthur to be out of my sight before we were married. It's different now, of course; if he does not behave well, I can stop his allowance, you know. That would be only fair.'

This seemed to confirm the rumour which had reached us to the effect that when it came to be a question of settlements, Marian had proved to be sufficiently a woman of business to keep the power in her own hands, notwithstanding the angry remonstrances of her lover and his sister. Perhaps also it was true, as it was said to be, that he would have drawn back at the last moment, but for shame.

I made some indefinite reply about putting off the time for being jealous as long as possible.

'Well, I can only say that it is a good thing I did not see him before I saw Arthur, or else you might have had cause enough to be jealous! But you needn't be afraid now. I am not one of *that* sort!'

And with that parting assurance, Mrs Trafford went her way, talking loudly over her shoulder as

she walked down the lane, to 'Caroline,' who followed in her wake, about the inconvenience of not being able to get into 'my carriage' at the gate.

We did not laugh over the bride's grandeur as we might have done had she been any one else; the remembrance of all that she had deprived Lillian of was too fresh upon us for that. And Lillian herself was in Marian's society reminded more vividly of the wrong which had been done to her mother.

'You were quite right, Mary,' said Philip to me when we were alone—alluding to the bridegroom. 'The poor wretch is punished enough! It's an awful punishment! By-the-bye, what was she whispering to you about all that time?'

'Offering me a view of the latest Paris fashions; and admiring you, ungrateful man that you are!' I smilingly replied. 'She thinks I must be terribly jealous.'

'Jealous; reddening. What did she mean?'

'I suppose she thinks she would be jealous in my place,' I said, a little surprised at his manner.

'In—your place. I do not understand,' he returned, as it seemed to me now, even angrily.

I laid my hand upon his arm. 'Of course I only repeated it because of its absurdity, Philip. Between you and me, it would be "Away at once with either love or jealousy."'

He took my hand in his, lifted it to his lips, and then turned away without a word. Well, I did not object to such silent leave-takings; they were eloquent enough for me. But I must not jest again in that way, I told myself, as I slowly returned to the cottage again. Philip evidently did not like it. Oddly enough, the first thing Lillian said, when I met her at the gate, where she was waiting for me, was upon the same topic. She had, it appeared, heard the one ominous word in Marian's whispered talk to me.

'What was Mrs Trafford saying to you about jealousy, Mary?' she asked, in a low tone and with averted eyes, trifling as she spoke with my watch-chain.

Did she fancy that Marian was still inclined to be jealous of her? I wondered.

'Only some nonsense about my being jealous of Philip, dearie,' I lightly replied.

'Jealous!—jealous of—Philip? What did she mean?' she ejaculated, using the words he had used with the same manner and even more anger.

'She seems to consider it is only natural that I should be jealous of him, since she tells me that his beard is the fashionable colour for heroes this season; but she was good enough to assure me that I need not be afraid of her now; although things might have been different if she had seen him some time ago. So I feel quite safe.'

'O Mary, are you sure, are you sure?'—with a little hysterical laugh.

'Am I sure, Lillian! Do you too require an assurance that I am not likely to become jealous of Mrs Trafford! You are almost as bad as Philip, and that is saying a great deal. Why, Lillian, what is the matter?'

She was laughing and crying together, with her arms about me, as different from her usual self as it was possible to be.

'It's the—the heat, I think,' she murmured. 'Do not notice me. I am stupid to-night, Mary.'

'She has deceived herself; her love for Arthur Trafford is not yet dead; and she is suffering the

shame which is natural to one of her nature at the discovery,' I thought. Inexpressibly pained, I silently drew her hand under my arm and led her into the cottage.

LAMPREYS.

ALMOST every schoolboy knows that King Henry I. died from eating too plentifully of lampreys, a 'food,' says Hume, 'which always agreed better with his palate than his constitution;' and yet, comparatively speaking, how few persons are familiar with the form, habits, and uses of the lamprey itself. It is usually defined as an 'eel-like fish,' and so far the definition is a correct one, seeing that an ordinary observer would conclude that the lamprey and the eel are identical, or at the most, that they are species of the same genus. Such, however, would be an erroneous conclusion. The lamprey undergoes a peculiar change of colour, being at times scarcely visible in the water, with variations from a silvery hue to a dark-brown back and a white belly. The eel has a bony skeleton, but that of the lamprey is soft and imperfect. The former has teeth with which to seize its prey or take a bait; the latter, as its name indicates (*lumber*, to lick, and *petra*, a stone), has a round sucking mouth with which to attach itself to rocks or stones, and though provided with very small teeth, which can pierce the skin of fishes or other soft substances, it may be said to subsist by suction rather than by eating. It has an elongated dorsal fin extending along the posterior half of the body to the tip of the tail, but is destitute of the pectorals with which the eel is furnished. The breathing organs of the lamprey are peculiar. In fishes with a bony skeleton there is usually but a single large orifice on each side of the throat, and in which the gills are covered with a valve-like flap called the operculum. The lamprey has seven external orifices like a row of round button-holes for breathing on each side, and apparently, without any protection. The animal is therefore quite distinct from all the species of eels.

Lampreys are in season from the first of September to the end of February, and during that period they are taken in large quantities in the river Ouse, above its confluence with the Trent. By some persons its flesh is esteemed a great delicacy, either potted or made into pies. However, it must be eaten sparingly, for if indulged in too freely it is apt to induce colic of a serious character. On that account the majority of people do not care to expose themselves to the danger that may ensue. The fishermen, as well as the peasantry in the neighbourhood where the lampreys are taken, rarely use them as an article of food. Still they form an important commodity of traffic to those who are engaged in it. During the last season nearly twenty thousand were secured at Naburn Lock alone, which is situated a few miles below the city of York. There are other stations at which we may conclude that the 'take' is equally good; let us say six: which would make a total of one hundred and twenty thousand fish. The average length of the lamprey is a foot—though it sometimes grows to three feet—and six are reckoned a pound; which, sold at two shillings, will produce a revenue of two thousand pounds sterling.

When we consider that these fish are taken in the dull portion of the year, when salmon and many other fish are not in season, we may readily understand that the sale of lampreys forms no insignificant supplement to the income of river fishermen, whose works are carried on generally on a somewhat limited scale.

In March these fish go up the stream in order to deposit their spawn in the shallows. In early summer the parent lampreys and their countless fry go down towards the brackish water; and the opinion long prevailed that the elders of the company never returned. That supposition is now disputed by the more observant of the fishermen, who believe in the coming of the old and young together, though no great difference in their size is apparent towards the month of September, when the season for catching them is recommenced. They are taken in wicker traps, which are constructed so as to secure the fish as they are washed in by the force of the current.

In Holland the lamprey is largely used as an article of bait. From a very early period it is said to have been the prime favourite for the purpose, and considerable quantities were brought from the English rivers to Rotterdam. Our informant says that the trade was suddenly brought to an end about a hundred years ago on account of the 'war' (declared by Great Britain against Holland in 1780). For nearly eighty years from that period the lamprey-fishing was almost abandoned, when some Dutchmen, influenced by a tradition which still lingered amongst their people to the effect that excellent bait had formerly been brought from England, made a voyage of discovery to the Ouse, where, after considerable inquiry and search, they discovered what had been described, and thus revived the trade in lampreys, which is now carried on more briskly than ever. They are taken away in barrels partially filled with water, transferred to tanks on board ship, and are thus preserved alive until required on the Dogger Bank or elsewhere.

THE DUKE'S PIPER:

A STORY OF THE WEST HIGHLANDS.

IN FOUR CHAPTERS.—CHAPTER IV.

FOR a week Maggie saw nothing and heard nothing of Angus. She became quite pale and worn with anxiety and distress. She hardly spoke to her father; and Janet reported that she was sure 'the mistress' was going into 'a decline,' because she hardly touched her food. To make matters worse, a letter came one day from her lover to say that he too was so miserable that he could bear it no longer; he was going to leave the Duke's yacht and go away—never more to return to Inversnow. Maggie was driven to the brink of despair by this letter—almost the only letter she had ever received in her life, and she forthwith wore it with the lock of his hair she had long treasured, next to her heart.

One afternoon a message came from the kitchen of the castle to ask the piper if he could oblige the cook with a dozen or so new-laid eggs, the cook's store having run short. Maggie took her basket, and went with the eggs to the castle kitchen.

She went with a sad heavy heart, and remained as short a time as possible, for her little romance with Angus and its sudden collapse were well known among the servants and, as she knew, discussed. Inversnow Castle stands in the midst of its own lovely park, close by the sea-loch, and girt about by wooded and heather-mantled hills. It was a warm sunny afternoon as Maggie tripped from the castle homeward; she was in no mood to meet any one; and to avoid doing so, she struck off the public path through the woods towards Glen Heath. A robin was piping pathetically among the elms, and the squirrels were gamboling in the sunshine among the branches overhead. As she walked slowly over the turf she drew forth Angus's letter to read once more, and as she read, the tears started afresh to her young eyes, and she sobbed as she went.

Presently she was surprised by a voice, a kind gentle voice, addressing her in a familiar tone: 'Well, Maggie Cameron, what may all these tears be about? You look sadder than a young and bonnie lass like you has any right to be, surely! Are you well enough?'

The girl looked and looked again, and the flush came and went in her cheeks as she became conscious that, stretched at full length on the grass close by, under the shade of an elm, with a book in one hand and a lighted cigar in the other, was—the Duke!

Maggie courtesied low with a natural politeness, and in her confusion dropped her letter, but hardly dared to stoop to pick it up.

'I'm sure, Your Grace, I peg your pardon humbly; it wass a great liberty I will be takin' in coming home this way instead o' the road.'

Maggie hardly knew whether to turn back or to go on; being undecided, she did neither, but stood still in some bewilderment, the letter still lying at her feet.

'But you have not answered my question, I think,' said the Duke encouragingly.

'I peg Your Grace's pardon again,' replied the girl nervously; 'but it wass—it wass—but it wass Angus'— And there she stopped abruptly, and fairly broke down.

'Come here, my child,' said the Duke, interested in the girl's manifest grief. 'And what about Angus? Tell me all about it. Who knows, I may be able to help you?'

The Highland maid looked into the thoughtful kind face of the Duke, and went a few steps towards him.

'It wass apoot Angus MacTavish, Your Grace, and he wass— But Your Grace will not know anything at all, at all apoot Angus.'

'Do you mean the game-keeper's son, one of my crew, Maggie?'

'Ay, Your Grace, that same!' said she with delighted eagerness.

'Oh, he's at the root of your distress, the rascal, is he?'

'And inteed no, Your Grace; it wass not him at all; he wad not hurt nopody's feelings what-e'er; oh, inteed, he's as cood and—and as prave a lad as iss in all the Hielants mierofer; and it iss not him, Your Grace, but my father and his father too had some quarrel; not but that they are cood men, poth cood men neither; but it wass all on account o' a gless o' pad whusky or the like o' that, I think; but—but—oh, Your Grace,

Angus is going away cass my father has taken a hatred of him, and won't hef a word that iss cood to say to him; and if Angus goes away, it wad break my heart!

The Duke rose, leaving his book on the grass, and placing his hand kindly on the maiden's shoulder, said: 'Come, Maggie, this may not be so bad as it seems! We shall see what we can do. Dry your eyes, child. Angus can't go away from my yacht without my consent, and I shall take care that he shall not go away. Take comfort from that. We shall see what can be done.'

'Oh, but my father iss fery obstinate, Your Grace, fery! And he wants me to marry another man that I cannot bear to look at.—But I am troubling Your Grace.'

The Duke's sympathy had wonderfully dispelled Maggie's awe.

'Well, well,' said the kindly nobleman, 'pick up your letter. If the piper won't listen to reason, we must see what can be done without him. But your father is a sensible man, and will no doubt listen to reason. Good-bye! Remember there must be no more crying. And you don't think it will be hard to bring Angus to reason? Well, well, we shall see. But remember, not another tear all the way home!'

Encouraged by the words of the great Highland Chief, Maggie courtesied low again, and sped homeward, with a burden lifted from her heart.

Angus MacTavish astonished the village watchmaker and jeweller by walking into his shop towards gloaming one evening, shutting the door carefully behind him, and even turning the key in the lock when he had satisfied himself there was no one present except the big-browed, hump-backed little watchmaker behind his glass cases.

'And iss it yourself, Angus MacTavish?'

'O ay, it iss me,' Angus was examining, with a deep flush on his face, the case of ornaments in front of him.

'And what iss it that I can pe dooing for ye, Angus, the nicht?'

'Oh, it wass only a'—Angus coughed—'it wass a ring—a gold ring that I wad be wanting ye to shew me mirofer.'

'Oho! that wass it, wass it?' said Mr Steven, winking at Angus, as he took his horn magnifying lens from his eye, and came from his three-legged stool and marvellous assortment of tiny hammers, pincers, and watchmaking gear scattered on the bench before him, to speak with Angus at the counter.

'Wass it a shentleman's ring now, Maister MacTavish, or a ring for the lass?'

'What wad the like o' me pe doing with a shentleman's ring, Mr Steven? Do ye take me for a wheeper-snapper lawyer's clerk, that ye should think o' me in that way?'

'Weel, weel, Angus lad, ye may pe right; but a' the lads wear them nooadays. Nae doot it iss ignorant vanity; but it is cood for trade, and it iss no for me to be finding fault wi' my customers. And it wass a ring for the lass—eh weel, that iss cood too,' said Mr Steven, pulling out a drawer full of subdivisions glistening with Scotch pebbles of many varieties set in gold, and placing them before Angus. 'Noo, there iss one that wad mak' any bonny lassie's mouth watter, and it iss only twelfe-an'-sixpence; and if ye like, I hef got a pair

o' ponny ear-rinks to match it—the whole lot for a pound.'

'Na,' said Angus, pushing aside the gaudy stone; 'it iss a plain gold ring I want, wi' no rubbishing stones apoot it.'

'Eh, what, Angus! And iss it a mairriage ring that ye wull pe wanting me to gif you mirofer? Eh weel! but that iss a fery different tale from what I hef peen hearing—and it wass a mairriage ring—eh dear me! But it iss myself that is happy to hear it.'

'Hush-t!' said Angus sharply, reddening. 'A man may want to hef a wedding-ring apoot him—maype for a friend or the like o' that—without his—his'—Angus coughed a retreat.

'O ay, ay; surely, Angus, surely. Nae doot apoot it; ay, ay, lad—nae doot apoot it!'

Angus left the shop with a circlet of gold in his waistcoat pocket.

Meantime, although almost a fortnight had passed, the piper's lawsuit hung in the wind, despite the fact that his legal adviser felt it to be his duty to hold frequent and prolonged conferences with him at Glen Heath. The lawyer was not such genial company as Angus had been; and though he did his best to be agreeable to Maggie and sociable with her father, even to the extent of trying to learn the bagpipes, he had to lay the unmanageable instrument aside, under the piper's sweeping generalisation, 'that lawyers had no more ear for music than the pigs.' In his heart the piper was not sorry to see that his daughter snubbed Angus's rival in spite of his own strictest commands.

The Highland maid seemed to be bearing her lover's banishment better than was to be expected. More than one attempt had been made by the young sailor to mollify Mr Cameron, without palpable signs of success; and when Maggie renewed her protests, she was met with the announcement that if MacTavish's name was again mentioned to him, she would be sent off to her aunt's in Glasgow for the winter—a threat the full significance of which none knew better than Maggie herself.

Then it was announced that on a certain evening there was to be a supper given by the Duke in the barn of the Home Farm, to which all the servants and many of the tenantry were invited; and to the piper it was intimated that he would be expected to bring his bagpipes with him. Here was quite sufficient reason for Maggie to be wearing her eyes out with the preparation of feminine finery, as the piper observed she had been doing for several days.

Early in the morning after Angus's interview with Mr Steven the watchmaker—and it was a lovely autumn morning—the piper's daughter might have been seen walking briskly, perhaps somewhat paler than usual, through a meadow at the western side of Inversnow, towards the loch. Her heart beat quickly as she went, and there was a touch of anxiety in her face as she glanced back occasionally to the white cottage on the slope at the entrance of Glen Heath, as if she expected to see some one following her. She walked quickly on, brushing aside the dew with her dress as she went, and hardly paused until she reached a sheltered inlet of the loch. At some little distance from the beach, a boat—Maggie's own boat—was resting on the water, and the maiden had barely time to spread her white kerchief to the wind, when the

oars were swiftly dipped, and almost immediately the bow of the boat ran high on the beach, grating along the pebbles almost to her feet, and Angus leaped out and held her in his arms.

'O Angus, dear, I don't think I can possibly go through with it—I really don't think I can!' she murmured.

'Ye are too late now, my bonny doo' [dove], 'too late now.'

Maggie stepped with Angus's help into the boat, although she did not think she could 'go through with it.'

'But if dad should come back and miss me—O Angus!'

'He will not come back. The Teuk—Cott pless him!—has sent him to the Dnaghn ruins with a party from the castle. Look, Maggie! do ye see the flag—the Teuk's flag—on the mainmast o' the yacht?'

Angus rowed swiftly, without swerving, to the yacht. Not another word was said as Maggie ascended the ladder from the boat, accompanied by Angus. She was rosy as she noticed the universal grin that greeted her from the men as she walked along the deck, between the good-natured captain and Angus, straight to the cabin. In the cabin—a room with its gold and crimson, and carved wood-work, its luxurious carpets and pictures, its books and piano, and the sweet glimpse of loch and mountain visible from the wide-open ports, that made Maggie feel as if she had been introduced to a nook in Paradise—she was overwhelmed to find herself again face to face with the Duke! With the Duke was her old friend Mr Fraser, the parish minister of Inversnow, whose presence had a wonderfully inspiring influence as he shook hands with her. Mr Fraser was a little gentleman with the whitest of hair and the sharpest yet the kindest of eyes. 'Are you quite certain, Maggie,' he said, handing his open snuff-box to the Duke, smiling, 'that now at the last moment you do not repent?'

'We can land you again in a twinkling, you know—can't we, Angus?' said the Duke, looking slyly from one to the other. Angus was standing in the background, rather sheepishly, if the truth were told, cap in hand. Maggie had hardly time to assure 'the minister' that she would be the last to disappoint His Grace the Duke, and was quite certain, when a door at the other end of a cabin opened, and the Duke's daughter, Lady Flora, entered; and again the Highland maid courtesied, overwhelmed with blushes as her Ladyship shook hands with her.

'We shall hear by-and-by what the piper has to say to this,' said Lady Flora; 'but you, Maggie, had better come with me for a time, that all may be done in good order.'

And so Maggie was carried off by the Duke's daughter to a second nook of paradise in blue velvet and gold and mirrors, a fairy cabin redolent with the perfume of flowers, and with a glorious peep of loch and mountain from a different point of view. The girl felt as if she were moving and talking in a dream.

When she emerged with Lady Flora she was clad in simple white attire, veiled, and a spray of heather-blossom mingling in her hair. Was it still a dream?—the minister with an open Bible before him, and Angus waiting to take her by the hand!

'Wilt thou have this woman to be thy wedded

wife?' &c.—the magic words that have sent a thrill through the hearts of so many generations, were sounding in their ears too. And as for Angus—well, Angus was conscious, as he placed the ring on Maggie's finger, that he was drifting away into a dreamy world of happiness, far better than he deserved, or ever, in his most ardent moments, dreamed were in store for him!

The piper returned with the party that had been committed to his guidance towards set of sun, and reached Glen Heath hungry as Esau from the field; he was impatient to be at the Home Farm barn, where he and his bagpipes were already due. So hungry and impatient was he that he did not cross-examine Janet with that severity which generally characterised him as she—well primed in her part—explained that Maggie had already started for the ball. No; the piper was speedily girding himself, in the merriest possible frame of mind, in his best, and smiling as he observed that Maggie had for the occasion adorned his bagpipes with new ribbons. The piper was no fop; but it was rumoured that the Duke himself was about to lead off the ball to-night, and that some of the ladies from the castle were to be present; so it behoved him to appear in his best tartan, which he did; and a finer specimen of the clan Cameron, firm on his legs, with a head set strongly on a pair of broad shoulders that proudly bore the bagpipes, never led clan to battle-field.

With all his haste, he was late. Many of the company were already seated at the long tables that extended from one end of the barn to the other. People were shaking hands and chatting freely, and already there was the fragrant odour of cooked meats, tempting the appetites of all and sundry. The room was gaily lit with candles and lamps from the castle. The piper lifted his cap politely in acknowledgment of the applause that greeted him as he entered.

'This is your place, Mr Cameron,' said the Duke's factor, who acted as steward for the occasion, pointing a place near the head of the table, and immediately opposite Mr MacTavish and his wife; the former of whom frowned blackly as the piper looked across at him.

'Na, Mr Reid, na; not just yet,' the piper said rising.

'A tune, Mr Cameron, a tune!' came from several quarters of the room; a request which the piper was pleased and proud to comply with. Nor did the music cease until the door opened, and the Duke walked in, Lady Flora leaning on his arm, and behind him Mr Fraser, leading in the mild-eyed Duchess; and behind these several of the Duke's guests. The bagpipes came to abrupt silence as the company rose to cheer the ducal party. When Mr Fraser had asked a blessing on the mercies which the Duke had provided for them, there came a loud clatter of knives and forks and an assault upon the dishes; and talk and laughter and merry din. The piper forgot the game-keeper in the absorbing fact that he was seated between Lady Flora and Factor Reid, an unusual and unexpected honour; so absorbed, that he hardly noticed that his daughter Maggie had not up to this moment appeared in the room.

When the dishes were cleared away and glasses and decanters stood regiment-wise along the table, the Chief rose and, when silence prevailed, said:

'My very good friends, before I ask you to fill bumpers for the toast of this evening, the nature of which I shall be called upon to explain presently—I wish you all to join with me in a glass to two very worthy friends of mine, and esteemed acquaintances of all of you; whose good qualities are too well known to require any words from me to commend them to your favourable notice—I mean our excellent friend Mr Cameron of Glen Heath, and my no less esteemed friend Mr MacTavish of Glen Ford—and may they never be worse friends than I am sure in their hearts they are to-night!'

There was a general clinking of glasses and nodding of heads towards the piper and the game-keeper: 'Your health, Mr Cameron!' 'I look towards ye, Mr MacTavish!' 'Your fery cood healths, shentlemen!' &c.

It need hardly be said that Mr Cameron and Mr MacTavish looked extremely foolish as the sounds gradually passed into silence, and all eyes became fixed on them; but neither of them seemed disposed to rise. At length the piper sprang to his feet.

'It wass a great honour that His Grace paid me, and I thank him for it with all my heart. And it wass—well it wass, ladies and shentlemens—well, ye may hef heard mierofer that there wass a small wee bit of a tiffence—inteed ye might call it a quarrel between Mister MacTavish and me, and it wass a pity too whatefer—nac doot there might be faults on poth sides—and Your Grace, if ye will allow me to say it—I pear no enmity to no man this night, no not to Mister MacTavish, nor to any other shentleman at all, at all.'

'Bravo! bravo!' exclaimed the Duke, looking towards Mr MacTavish. But that worthy had no gift of words, and only signified his emotion by a series of dry-lipped jerks and nods and a waving of the hands in the piper's direction, meant to imply his general assent to the piper's view of the case.

The Duke again rose. 'I now rise to ask you, every one of you, Mr Cameron and Mr MacTavish included, to fill your glasses a good bumper, to drink with me the toast of this evening. I drink to the very good health of the bride and bridegroom in whose honour this ball is given to-night.' At the same moment the door opened, and Angus MacTavish entered with Maggie Cameron—no longer Cameron—leaning on his arm. Maggie looked round the room in some bewilderment. When her eye met her father's, her hand dropped from Angus's arm, and with her face all pale, she walked firmly toward him. When she came to him, she stopped.

'Dad!'—with quivering lip and with eyes in which lurked tears—'iss it angry with me ye are then, dad, cuss I hef married Angus MacTavish? O dad, ye'll no pe that angry!'

The piper, conscious of the dramatic possibilities of the situation, paused, looked at the Highland Chief, who was still on his feet, and then at Maggie's sweet fresh face, which was turned piteously to him. He looked at the white muslin dress, prettily studded over with satin bows, and from there to the dainty white satin boot that peeped from below the dress, and felt proud to be his daughter's father.

'And iss it merrit ye are then, Maggie, to Angus MacTavish? but it iss—well, it iss a praw lad too, and well deservin' a praw lass for his wife'—

Maggie's arms were immediately thrown about her father's neck, and the welled-up tears found easy channel.

'Gif me your hand, Angus, ye pla-guard!' The hands griped with Celtic impetuosity.

'Excuse me, Mr Cameron,' interrupted the Duke. 'Ladies and gentlemen, we must drink the young couple's health with full Highland honours; and no heel-taps!' The rafters rung with hearty cheers as the men stood with one foot on their seats and the other on the edge of the table, doing honour to the Chief's bidding to youth and beauty.

This ceremony over, the piper rose, walked slowly and solemnly, amidst the silence of the company, to the place where Mr MacTavish sat. Mr MacTavish rose, and the men faced each other.

'Tonald!' said the piper impressively.

'John!' said the game-keeper. A pause.

'It wass an angry man I wass, Tonald!'

'And so wass I neither,' said the game-keeper.

'But we will droon it all in this, John,' said the piper, filling two glasses with whisky, and handing one to his friend.

'But the oil-cake nefer wass biled!' said Donald solemnly, as he poised his glass between him and the light.

'Tessle take the oil-cake, John!' said the piper impetuously. 'Gif me your hand, man!'

And the reconciliation was complete.

The tables were speedily cleared away, the piper soon discoursing stirring music from his pipes; with the satisfaction of seeing the Duke lead off his beaming child as partner in the first reel. Daylight peeped in before the pipes were quieted, or the noise and merriment of the company were hushed.

And now, before the door of a cottage that has been built within a short distance of the piper's, there are to be seen three fine boys and a 'sonsie' lassie, the eldest rejoicing in having a Duke for god-father; and a proud man is the piper as he teaches Archie the oldest boy how to extract martial music from a sheep's bladder, which the ingenious youth has converted with skill into home-made bagpipes. To this day, the piper, on whom years are beginning to tell their pathetic tale, meets his friend the game-keeper once or twice a week at Mrs MacDonald's clachan among the hills, and the toast which always furnishes an excuse for the one extra glass that the piper thinks needful to send him cheerily on his way home is—'Cott pless the Teuk!'

THE MONTH:

SCIENCE AND ARTS.

WE often read in the newspapers that a certain ship has been taken out to the 'measured mile' for trial of her speed, which means that, in order to try the steam-engines, they must be put into the ship, and the ship into the water. Like much else in English practice, it is an uncertain way of finding out that which ought to be previously known; for it is a trial of more than the engines, seeing that it includes the merits and defects of the boilers and of the ship, and the behaviour of the steam, which exercise an important influence on the result. If, therefore, the engines only are

to be tested, the trial might as well be made while the vessel is still in dock; and while still in dock there should be some means for ascertaining and accurately indicating their capabilities. This means has been invented by Mr Froude, F.R.S., who has already done so much for the science of shipbuilding; and his new dynamometer seems likely to fulfil the intended purpose. It combines some of the most recondite principles in mechanical philosophy, but may be roughly described as a turbine with its segmental divisions so constructed that, when set rotating, the water inclosed is urged into a state of resistance. This resistance varies with the speed and power of the engines; and a spring lever, communicating with the interior of the apparatus, indicates the variations on an external scale. The turbine will be temporarily fixed to the end of the screw-shaft, the engines will be set to work, and as the shaft spins round, the power of the engines will be clearly and independently demonstrated, even up to eight thousand horse-power, if required. The capabilities of the engines having been thus accurately ascertained while the ship is still in dock, it will be possible, when trying her over the measured mile, to define how far her speed is affected by other influences, in summing up the result. A working model of this ingenious invention has been exhibited to the Admiralty and at scientific gatherings in London.

Mr Cochot, 34 Avenue Lacuée, Paris, has constructed a small steam-engine of half a horse-power, for use in petty manufactures, which, as he states, will work ten hours at a cost of not more than fourteenpence for coal.

Mr Redier, clockmaker of Paris, has exhibited to the Société d'Encouragement pour l'Industrie Nationale a balance which registers variations of weight. In this ingenious instrument clockwork is so arranged in connection with a copper cylinder, suspended in a vessel of water, as to produce two antagonistic movements, one of which comes into play whenever excited by the action of the other. By this alternate movement the registration proceeds steadily, and is recorded by a pencil on a band of paper. An exceedingly light spring lever is so combined with the clockwork that it will keep a comparatively heavy weight in action; such as holding a barometer free to rise and fall while the column of mercury stands always at the same level. Many applications may be made of this instrument, especially in the sciences of observation. Its sensibility is such that it will register the loss of weight in a spirit-lamp while burning. The physiologist may employ it to ascertain the weight lost by animals during respiration and perspiration, and the botanist to determine the amount of evaporation from the leaves of a plant; and from these examples others may be imagined.

Stock-taking in science is as indispensable as in business, and there is something like stock-taking in the subject for which the University of Oxford proposes to give a ten guinea medal and about

five guineas in cash: it is 'The History of the successive Stages of our Knowledge of Nebulæ, Nebulous Stars, and Star Clusters, from the time of Sir William Herschel.'

The Royal Astronomical Society have published an account of observations of Jupiter's satellites made by Mr Todd of the Observatory, Adelaide, under remarkably favourable circumstances. Sometimes the satellite, when on the point of occultation, is seen apparently through the edge of Jupiter, 'as if the planet were surrounded by a transparent atmosphere laden with clouds.' In a subsequent observation, 'the shadow of the third satellite, when in mid-transit along a high northern parallel, appeared to be visibly oval or flattened at the poles.' On several occasions, as Mr Todd states, he has been surprised at ingress of shadow by the marvellous sharpness, the minutest indentation of the limb being at once detected. One night he saw the second satellite, as it emerged from behind the planet, immediately pass into the shadow, then reappear within a few minutes of the reappearance of and close to the first satellite; and the two thus formed 'a pretty coarse double star.' This must have been a very interesting sight. And there were times when the astronomer was much impressed by the sudden and extensive changes in the cloud-belts of the planet, as though some storm were there in progress, changing the form and dimensions of the belts in an hour or two, or even less. After reading this, may we not say that the observer at Adelaide is remarkably fortunate?

The fall of exceedingly minute mineral particles in the snow and rain in regions far away from dust and smoke has been accepted as evidence that a so-called 'cosmic dust' floats in our atmosphere. Some physicists believe that this dust is always falling everywhere, that the bulk of the earth is increased, and that the phenomenon known to astronomers as acceleration of the moon's motion is thereby accounted for. Iron is found among the particles, exceedingly small and globular in form, as if they had been subjected to a high temperature. Recent spectrum analysis has led to the conclusion that the light of the aurora borealis may be due to the presence of these particles of iron in a state of incandescence. In a communication to the Vaudoise Society of Natural Sciences, Mr Yung assumes that this dust, coming to us from celestial space, will be most abundant immediately after the showers of shooting-stars in August and November; and he purposes to collect masses of air on great heights and treat them in such a way as to eliminate all the cosmic dust which they may contain. His experiments lead him to believe that the particles are in much greater quantity than hitherto supposed, and that they play an important part in the physics of the globe and in the dispersion of solar light. Dr Tyndall has shewn that a perfectly pure gas has no dispersive action. The cosmic dust floating in the upper regions of the atmosphere would account for the luminous train of meteors, and for certain phenomena observed by means of the spectroscope. A long time will of course be required for the quantitative experiments, but they will be of great interest to astronomers as well as to physicists generally.

A telephone has been exhibited at some of the

evening receptions in London, but failed to give satisfactory demonstration of its sound-transmitting powers. In America, on the contrary, the success is so remarkable, that the Society of Telegraph Engineers have sent out a deputation to gather information on the interesting subject. In addition to the instances already given in these pages, we have now to present further particulars on the authority of an American contemporary. In April last, telephonic concerts were held in Washington and Boston, the source of the music being in Philadelphia. At each place (that is, Washington and Boston) the music, though rather feeble in tone, was distinctly heard by the audience in all parts of the hall. The different tunes were recognised and listened to with profound attention, the intonations being so clear and distinct as to excite wonder and applause. We are further informed that 'the music (or electric waves of sound) was also conveyed by induction along other parallel telegraphic wires attached to the same poles; for in a telegraph office in Washington the tunes played at Philadelphia were distinctly heard on a "relay" used in the despatch service, and even at some yards' distance from the instrument.' This is the more remarkable as the relay 'had no connection whatever with the wire attached to the telephone.' Another noteworthy characteristic of the telephone is that it will, as is said, deliver a number of spoken messages at the same time without confusion.

If a 'distinguished architect or man of science of any country can shew that he has designed or executed any building of high merit, or produced a work tending to promote or facilitate the knowledge of architecture, or the various branches of science connected therewith,' the Council of the Royal Institute of British Architects will, if they find him worthy, bestow on him their Royal medal. Such are the conditions announced; but supposing that an undistinguished architect should prove himself competent, is it to be understood that he will have no claim to consideration? The Council further announce that they will give their Soane medallion and fifty pounds for the best design for a convalescent hospital for sixty patients: Sir W. Tite's prize, thirty pounds, for the best design in Italian style for the façade of a block of buildings in a principal street: the Grissell medal for the best set of drawings illustrating the design and construction of two bays of a groined cloister of the thirteenth century; and the Institute silver medal for the best essay on the Constructive Uses and Artistic Treatment of Concrete. This last is a practical subject which admits of wide application and development.

A paper by Mr S. Knight, read before the same Institute, 'On the Influence of Business Requirements on Street Architecture,' contains information and suggestions which any one interested in the subject would do well to study. The claims of various styles, the Italian, the Gothic, the Composite, are discussed, with due consideration of the important questions of strength, effect, and light. If the Italian has come to be preferred, a reason why can be given; but Mr Knight is of opinion that Gothic is compatible with business requirements, and he brings forward instances. And he remarks: 'The pointed gable is a mode of finishing a roof towards a street as consistent in construction as it is expressive and picturesque in effect; the

open valleys between the gables, where repeated in rows, let in light.' Oriel windows, with a glass roof, are described as the best for admission of light. As connected with styles of architecture, we mention that at a previous meeting of the Institute it was shewn that the 'Queen Anne's' style, if rightly named, would be the Stuart style.

It is computed that five million tons of coal are burnt in London in a year. The President of the Meteorological Society states in his annual address that the heat thereby produced combined with that evolved by the inhabitants, suffices to raise the temperature of the air two degrees immediately above the metropolis. Hence it is that some invalids find it better for their health to reside in London during the winter rather than in the country. But the country benefits also, for the prevailing winds being from the south-west and west, the county of Essex and the valley of the Thames below London profit by the adventitious warmth. On the other hand, it is stated that 'London air even in the suburbs proves, as might be expected, exceedingly impervious to the sun's rays.'

Jute is a low-priced product, and is regarded as fit only for very coarse manufactures; and dishonest rope-makers mix it with the hemp which they twist into ropes and cables. But specimens laid before the Paris Society above mentioned demonstrate that jute has remarkable qualities which may be developed by proper treatment. Everything depends on the amount of care bestowed on the preparation and conversion into yarn or thread; it can then be woven into textures suitable for upholstery decorations, for dress, and for household uses, comparable to those produced from flax and hemp.

From further published statements concerning the eucalyptus we learn that this useful tree has been introduced into Corsica, chiefly through the endeavours of Dr Carloti, President of the Ajaccio Agricultural Society. More than half a million of the young trees are now growing in the island. And it appears from reports made to the Climatological Society of Algiers that more than a million plants of the eucalyptus are growing in that country; that the trees 'possess sanitary influence; that wherever they have been largely cultivated intermittent fever has decreased in frequency and intensity, and that marshy and uncultivated lands have been improved and rendered healthy.'

In 1850, deep borings were made on the Marquis of Downshire's estate near Carrickfergus to explore for coal beneath the old red sandstone. The greatest depth attained was about fifteen hundred feet; no coal was found; but at about five hundred feet from the surface a bed of rock-salt was discovered, which has been turned to good account. We are informed by the President of the Belfast Natural History and Philosophical Society that the bed of salt in the hills to the north of Carrickfergus is more than a hundred feet thick, that fifty feet are left as a roof, while fifty feet are being excavated, and that the roof is supported by pillars of the rock-salt nearly fifty feet thick left standing.

An anchor of novel construction has been made and patented by Mr G. Tyzack of Stourbridge. The novelty consists in the anchor having one arm only, which is reversible and so arranged that whichever way the anchor falls, it finds itself

at once in a position to 'bite.' There being no projection above the shank, the anchor is less likely to foul than ordinary kinds; it can readily be taken to pieces and compactly stowed; is said to possess unusual strength; and being made without welding, claims to be cheaper than other portable or swivel anchors. This seems worthy the attention of shipowners and yachtsmen.

A meeting was held last year to talk about a Sanitary Institute. A committee was appointed: they have published a Report and list of members, by which we are made aware that the Institute is now at work, and intends 'to devote itself exclusively to the advancement of all subjects bearing upon public health.' Among these subjects we find ascertaining the qualifications of subordinate officers of sanitary districts—matters relating to medicine and to chemistry in connection with public health—and the establishment of an exhibition of sanitary apparatus and appliances. This is a good programme, with the advantage that its objects may be promoted by persons in all parts of the kingdom. The temporary offices of the Institute are at 11 Spring Gardens, London, S.W.

A paper by Mr Neison on the Statistics of the Societies of Odd-Fellows and Foresters is published in the *Journal* of the Statistical Society. It furnishes much useful information concerning those associations generally, and shews in what the elements of their success or failure consist. In some instances there is a great tendency towards large and growing sick-lists, which, as Mr Neison remarks, should be carefully watched. He was acquainted with a society in which the rate of sickness was so remarkable that he could not account for it. 'Not only,' he says, 'nine out of every ten were sick, but sick on an average of thirty weeks out of fifty-two. On inquiry he found that these were agricultural labourers, getting a wage of ten shillings a week, and were insured for a benefit varying from eight shillings to eight-and-sixpence. After being sick for a short time they were entitled to half of the benefit, which would be four shillings. Then they obtained two shillings and sixpence from the parish, together with some loaves of bread, which would amount to about seven shillings a week for doing nothing; and as they only get about nine to ten shillings by labouring, they thought the better way was to stop at home and sham illness.' Facts of this kind are not new to us.

THE SOLAN GOOSE.

Mr Frank Buckland has been experimenting upon the anatomical construction of the gannet, and says it possesses in its body the most perfect aeronautic machinery that can be conceived. There is a communication between the lungs, the feathers, and the hollow bones of the bird, by means of which it is able to inflate itself like a balloon. The gannet on which Mr Buckland experimented measured nine inches across the chest, but when inflated it measured fourteen inches. By suddenly pressing the inflated body, the dead bird immediately gave out the loud call of the bird when alive, the sound being produced by means of the air passing through the voice-box at the bottom of the windpipe. The gannet can instantaneously extend all this air from its lungs, bones,

and feathers; and this enables it to drop down from a height upon its prey in the sea with amazing force and rapidity. Some years ago one of these birds was flying over Penzance in Cornwall, when seeing some pilchards lying on a fir plank, in a place for curing those fish, it darted itself down with so much violence as to stick its bill quite through an inch and a quarter plank, and kill itself on the spot. The bones of the bird's neck are of amazing strength, and as hard as an iron rod. The head is joined to the atlas by a beautiful ball-and-socket joint.—*Newspaper paragraph.*

THE LANGUAGE OF FLOWERS.

FROM THE GERMAN.

FRAGRANT daughters of the earth,
Love presided at your birth;
Fancy, by your floral aid,
Passion's ardour oft portrayed;
Let me, then, a garland twine
Of varied hues, to picture mine.

Purity, with brow serene,
Needs no costly jewel's sheen;
Cull the Lily's blossom sweet
To strew the path beneath her feet.
In its virgin hue we find
An image of the spotless mind.

Braid the maiden's glossy hair;
Place the verdant Myrtle there;
Love, with roses myrtle blended,
When to earth He first descended;
It will blossom brighter now,
On the fair one's snowy brow.

Shining Laurel, let not Fame
Your leaves, for heroes only, claim;
On blood-stained fields they gain the prize
The Poet wins in peaceful guise;
The poets, then, with heroes share
The right the laurel crown to wear.

Know you the Rose? the garden's queen!
Few months, alas! her bloom is seen;
Breathing incense to the air,
Magic odours hover there.
But near the rose, the thorn is ever;
Who can love from sorrow sever?

Let the Daisy's modest grace
In my garland find a place;
The 'bonnie gem' of Scotia's Bard,
'Mid rarer flowers in garden cared,
Though humbly reared, a part may claim,
In memory of the Poet's fame.

Dusky Cypress, sadness weaves
Wreaths for mourners of thy leaves;
Ever o'er the silent grave
Drooping branches sadly wave.
Ah! how vain the tears we shed
For friends once numbered with the dead!

See! Life's pictures quickly fade,
And the flowers in dust are laid;
But the Spring's awak'ning fire
Love and Life once more inspire:
To mourning hearts a hope is given
That we may meet and love in Heaven!

STORY OF THE FAIRBAIRNS.

TOWARDS the end of last century, the family of Andrew Fairbairn resided at the foot of the Woodmarket, Kelso. Andrew was a man in humble circumstances, but was intelligent and industrious, and fond of reading. He had spent his early life as a ploughboy, and afterwards as a gardener; by which means, along with the perusal of books, he gained a good knowledge of agriculture. Having in the course of pushing his fortunes gone to reside near a seaport in England, he was, during the exigencies of the American war, pressed on board a frigate, from which he was draughted into a ship of the line, and served under Lord Howe at the destruction of the Spanish fleet off Gibraltar. At the close of the war, he happened to be present at Spithead, when the *Royal George* sank, August 29, 1782, and assisted in saving the survivors. Receiving his discharge, he returned to Scotland, and settling in Kelso, married Miss Henderson, daughter of a tradesman in Jedburgh, and in due time had a family of sons and daughters. That may be called the beginning of the Fairbairns.

Andrew did not return to sea-life. He had had enough of naval adventure. Kelso, where he pitched his camp, is a pretty inland town on the north bank of the Tweed, once celebrated for an abbey, of which the ruins still exist, and having in its immediate neighbourhood the palatial mansion of Fleurs, the seat of the Dukes of Roxburghe. All around is a fine fertile country, where there is abundant scope for agricultural pursuits. To these he addicted himself, though taking him six days a week from home, and obliging him to devolve the upbringing of his children in a great measure to his wife, who was eminently suited for this important duty. She was far from robust, and her poor state of health would have offered a good excuse for idleness; but possessing a spirit of indefatigable industry, she toiled in a way that reminds us of the singularly meritorious wife mentioned in Scripture—'She seeketh wool and flax, and worketh willingly with her hands. . .

She looketh well to the ways of her household, and eateth not the bread of idleness. . . Her children arise up, and call her blessed.' The picture is accurate in every detail. According to the economy of the period, when as yet the domestic spinning-wheel was in operation, Mrs Fairbairn bought wool and flax, which she spun into yarn, reeled into hanks, and gave out to a weaver to be manufactured. From the varied materials so produced, she provided shirtings, sheets, and blankets for the family. And not only so, but for some years she made all the coats, trousers, and other garments for her husband and sons, besides all the dresses required for her young daughters.

William Fairbairn, the eldest and most notable of her sons, was born at Kelso, February 19, 1789. There he received a plain elementary education at the parish school, paddled like other boys in the Tweed, and acquired a proficiency in climbing the tall picturesque ruins of the abbey. In 1799, the family were induced to remove to Moy, a farm a few miles from Dingwall in Ross-shire. Here commenced a desperate struggle to wring a subsistence out of a piece of land plentifully dotted over with whins, stones, rocks, and other obstructions. Andrew, the father, had an opportunity of exercising all the agricultural knowledge he possessed. Like many Scotsmen in similar circumstances, he did not despair. To remove the various impediments to the plough, he adopted an ingenious method. Having managed to draw the large stones and rocks into heaps, he laid over them quantities of dried whins, which he set on fire. The stones and rocks became red-hot, and by the pouring on them of cold water from a bottle, were fractured and blown to shivers. By the wondering neighbours, this cheap and ready method of ridding the land of whins and rocks at the same time was considered an extraordinary performance. Next was instituted a system of draining; and in two or three years, splendid crops of turnips and barley were growing on land which had hitherto been little better than a wilderness.

While the family were at Moy, William received no addition to his education, and had to

occupy much of his time as a nurse to his youngest brother, Peter, then a child of fifteen months old. To relieve himself of the trouble of carrying the child on his back, he fell on the device of making a little wagon with four wheels. It was a somewhat difficult undertaking, for his only tools were a knife, a gimlet, and an old saw. With these and a red-hot poker to burn holes in the wheels for the axles, he was able to knock up a small wagon, which proved quite a success. He dragged Peter about the farm, to the delight of the infant and the satisfaction of his mother. Encouraged by the success of the construction, he began to make small boats and mills with his knife, that were the admiration of neighbouring boys; such performances giving, as is believed, a bent to his mind as regards mechanical construction. Some untoward circumstances led Andrew Fairbairn to quit Moy and to become steward to a Highland laird at Mulloch. In this situation he remained only two years; and now, disgusted with the Highlands, he removed with his family, in 1803, back to Kelso. There he left them while he occupied the position of farm-manager in Yorkshire. This was a dark period in the history of the Fairbairns. The father did his best to supply means by transmitting part of his wages, but the wages were irregularly paid, and sometimes the family were on the brink of want. Being now a tall lad of fourteen, William made an effort to get an employment which would bring in a few shillings a week. He considered himself fortunate in getting work as a mason's labourer at the building of the new bridge across the Tweed at Kelso—one of Rennie's handsome structures. When only a few days at this toilsome employment, William suffered a dire misfortune. By the clumsy management of a companion in carrying a haud-barrow, a heavy stone fell on his leg, inflicting a deep wound, and throwing him off work for nearly three months. When the family were in the depths of penury, the father succeeded in getting an appointment at Percy Main Colliery, near South Shields, as steward of a farm belonging to the coal-owners. There was still the disadvantage of being absent from his family, but the pay regularly administered put him in comfort, and he had an opportunity of getting some employment for his eldest son.

The employment so secured was not much to speak of: it was only that of driving a coal-cart, but nothing better cast up, and was dutifully endured amidst a dissolute and contentious population, until, at the instance of the owners of the colliery, William, in 1804, was bound apprentice for seven years to Mr John Robinson, the engine-wright of the establishment. Such was the start in life of William Fairbairn as an engineer. At first, his wages were five, afterwards rising to twelve, shillings a week; but there was extra work paid for separately, by which his small wage was often doubled, and he was able to help his parents, who were struggling with a very limited income.

As we all know, there are two ways of pursuing an industrial occupation in youth. One is to do no more than what is immediately required, caring little for the future; the other is to endeavour, by every available means, to strike out a course of self-improvement, not only for the pleasure of doing so, but it may be in the hope of reaping

some future advantage. William Fairbairn adopted the latter method of getting through his apprenticeship. He laid down for himself a programme of self-instruction, while most other lads about him spent all their leisure time in coarse and profitless amusements. His weekly programme is worth the attention of young men placed in similar circumstances. Every day had its assigned work—Monday evenings, the study of arithmetic and mensuration. Tuesday, reading history and poetry. Wednesday, recreation, reading novels and romances. Thursday, mathematics. Friday, Euclid, trigonometry. Saturday, recreation and sundries. Sunday, church, reading Milton, &c. These several exercises were facilitated by books procured from the North-Shields subscription library, for which his father bought for him a ticket. Besides going through a course of reading the best historical and other works, which widened his knowledge and cultivated his feelings, he in a period of three years went through a complete system of mensuration, and as much algebra as enabled him to solve an equation; also a course of trigonometry, navigation, and some other branches of science. At times he devised pieces of machinery, which taught him the necessity of arranging and concentrating his ideas in matters of mechanical ingenuity. Having a taste for music, he made a violin, on which he taught himself to play familiar Scotch airs, though never with any degree of brilliance. His mind leaned towards more solid acquirements. As a kind of promotion, he was removed from the workshop to take charge of the steam-engine and pumps. Now, he was more his own master, and had intervals of time at his disposal. No amount of leisure, however, diverted him from his course of self-culture. His companions spent not a little time and money in beer-drinking, which kept them in poverty, and effectually stood in the way of their advancement. One of his early contemporaries was happily superior to these debasing pursuits. This was George Stephenson, with whom he became acquainted. George had the charge of an engine at Willington Ballast Hill, only a mile or two off, and being recently married, was somewhat pinched in the means of livelihood. To enable him to earn a few shillings, Fairbairn frequently took charge of his engine, while he took a turn at heaving ballast out of the colliery vessels. It is interesting to hear of facts like this of two men who rose to eminence through self-culture and unrelaxing perseverance.

At the close of his apprenticeship, and now twenty-two years of age, William Fairbairn went to London in search of employment as a millwright or working engineer. At this time Rennie was engaged in building Waterloo Bridge, and offered work to William Fairbairn. But—and a sad 'but' it was—the Millwrights' Society, which assumed the right of determining who should be employed, would not allow work to be given to him; and for a time, along with a companion similarly situated, he underwent serious privations. Unless for succour from some hospitable relatives who gave him a dinner on Sunday, he would have been well-nigh starved. A brighter day at length dawned. A number of workmen had the fortitude to resist the monopoly of the Millwrights' Society, and banding together, set up a Society of free and independent

labourers, under whose auspices Fairbairn got employment at a patent Ropery at Shadwell. Here and elsewhere he wrought as a journeyman two years in the metropolis, all the time realising good wages of from two to three pounds a week, and as formerly occupying his leisure hours mostly in reading. As he lived moderately, he saved some money, with which he hoped to push his way forward. Unluckily, he fell in with a crazy projector, who had devised a plan of delving land by machinery. The thing was ingenious, but not practicable. Induced to make a machine for the inventor, Fairbairn's small savings were swept away. He was more fortunate in his next order. It was to make a machine for chopping meat for sausages, for which he was promised thirty-three pounds by a pork-butcher. The machine, constructed with a fly-wheel and a double crank, with a dozen knives crossing each other, did its work admirably. The pork-butcher was delighted, and paid handsomely for the machine.

Put in pocket by this piece of business, Fairbairn proceeded to Dublin in quest of work, and got employment in constructing nail-making machinery. This lasted during a summer, and back he came to England, the voyage by packet to Liverpool occupying two days. A lucky thought directed him to try Manchester as a field of operations. Here he received employment from Mr Adam Parkinson, for whom he worked two years, and from his earnings was able to save twenty pounds, a sum which he destined to set him up in married life. For several years he had corresponded with Dorothy Mar, daughter of a farmer at Morpeth, and for whom he entertained an ardent affection. Fortune, as he imagined, being now propitious, marriage with Miss Mar could be discreetly contemplated, and the marriage took place June 16, 1816. The young pair commenced house-keeping in a very small and modest domicile at Manchester. William Fairbairn had still to make his way in the world, and blest with this good wife, set about doing it vigorously. For certain spheres of usefulness, Manchester offers better scope than even London. In partnership at first with Mr James Lillie, he began an independent career as a millwright, or in fact, a contractor for any large undertaking from a bridge to a spinning-factory. The two in setting up business had hardly any money, but they had brains, which had been pretty well exercised, and people were disposed to throw work in the way of what seemed to be two eager and clever young men. A large job executed for Mr Murray, a cotton-spinner, put them on their feet. Well-doing needs only a beginning. Almost immediately followed the works on a new cotton-mill for Mr John Kennedy, partner in the firm of Messrs McConnell and Kennedy, then the largest spinners in the kingdom. The skilful manner in which improvements were introduced into the new mill brought a press of orders. The business prospered so greatly, that at the end of five years the two young men found themselves with a stock and tools worth five thousand pounds. Large and commodious premises were erected, and contracts for gigantic works were undertaken in England, Scotland, and Switzerland.

Fairbairn lived at a time when the world was startled with the marvels of steam-traction on railways, and he fancied that a similar means of

propulsion could be adopted on canals. In this, after several costly experiments, he found himself mistaken, and the drainage of money was so great as to lead to a dissolution of his partnership with Mr Lillie. Now (1832), he rested entirely on his own energies and resources; but strong in self-reliance, he had no fears of the result. He turned his attention to a new branch of engineering manufacture, that of iron ship-building. For a time he had two establishments, one in London, the other in Manchester, and collectively employed two thousand hands. In 1835 began his famous investigations into the strength of iron, as regards girders, beams, pillars, and so forth; his experiments being of much scientific and mechanical importance. This, indeed, might be described as the great work of Fairbairn's life; for from his discoveries has sprung that remarkable adaptation of cast-iron in various forms—to house-building, the construction of bridges, and other works. About the same time, owing to a strike of boiler-makers at Manchester, he invented a method of riveting the plates of boilers by machinery, which at once superseded hand-labour. No longer were people assailed with the din of a hundred hammers riveting together iron plates; the machine of Fairbairn's invention substituted a rapid, noiseless, and comparatively cheap method of construction.

Until his fiftieth year, Mr Fairbairn wrote an autobiographical account of his career, and the projects with which he was concerned, which has been incorporated in the recently issued work, *The Life of Sir William Fairbairn, Bart.*, by W. Pole (Longmans, 1877). Mr Pole continues the narrative, but in so fragmentary and meagre a form as to give us little insight into the private life of the person to whom he refers, or of the family to which he belonged. Happily we were honoured with the friendship not only of Sir William, but of his brother, Sir Peter Fairbairn of Leeds—the brother whom when a child he drew about in a little wagon of his own making, long ago in the Highlands. Our last interview with Sir William was shortly before his decease, when on what we believe was his farewell visit to Scotland. From both brothers we learned a variety of details relative to their respective professional pursuits, and on all occasions were struck with the strong practical common-sense and tact which had guided them through life. From the humblest possible circumstances, each in his own way had attained distinction by the exercise of sound judgment and persevering industry connected with the manufacture of machinery. The lesson which their lives afforded was this: that success in life is less generally due to genius than to indomitable diligence along with integrity of character.

Sir William Fairbairn never, as we know, aimed at being a great man. He wanted only to be useful in his day and generation. His habits of industry were extraordinary. Besides devoting himself specially to new mechanical contrivances and scientific researches, he spent much time in his later years in writing papers for the British Association and other public bodies. On one subject he fastened keenly. It was the prevention of smoke from factory chimneys, which he shewed could be effectually done by a more perfect combustion of fuel. The paper appeared in the Transactions of the British Association for 1844. It is

doubtful if it made many converts. There seems to be a determination among manufacturers to disregard all advice or remonstrance on the subject. For more than thirty years we have used a plan for consuming smoke with perfect success and considerable economy of fuel, but our neighbours for the most part perversely go on polluting the atmosphere as usual.

As is well known, Sir William Fairbairn distinguished himself by his invention of the tubular iron bridge, sustained without stays, and, which adopted by Stephenson, was employed in the construction of the famous tubular iron bridge across the Menai Strait, which is entitled to be called the mechanical wonder of England. We have never been shot along in a railway train through that iron tube, formed by a succession of square cells placed end to end, without thinking of Fairbairn's 'bold ingenuity.' The reputation he acquired by this and other inventions of a useful kind brought him honours from numerous quarters. He had declined to accept a knighthood, and was reserved for the higher dignity of a baronetcy, which was conferred during Mr Gladstone's tenure of office in 1869. Two years previously, he had the misfortune to lose his eldest son, John, a blow which was severely felt by him. Coming from a long-lived family—his father dying in 1844 at the age of eighty-six—and tall, robust, and active, he enjoyed health till nearly the end of his days. He died peacefully August 18, 1874, leaving three sons and a daughter, also a widow, to mourn his loss. He was succeeded in the baronetcy by his son Thomas. Though the family wished the funeral to be private, it was, as a voluntary mark of respect, attended by upwards of fifty thousand persons. Such was the end of one of the greatest engineers of our day. His whole life pointed a valuable moral which it is unnecessary to repeat. His brother, Sir Peter Fairbairn of Leeds, predeceased him, leaving likewise descendants to perpetuate the reputation of the Fairbairns. w. c.

THE LAST OF THE HADDONS.

CHAPTER XXXI.—AT THE STILE.

WHEN was I first conscious of it? When was the first faint shadow of it perceived by the others? It would be difficult to say precisely when; but as days went by, some subtle change was taking place and making itself felt amongst us. Gradually an indefinable something was extracting the sunshine out of our lives. None of us admitted so much to each other; indeed I think we were all equally anxious to have it thought that everything was going on in precisely the same way as before. And yet—where was the frank confidence and ease which only a short time previously had so marked our intercourse? It had given place to constraint, and a rest-less anxiety to appear unconstrained.

I fancied that I could account for Lilian's nervousness and constraint; but Philip's gaiety seemed to be growing less and less spontaneous; and dear old Mrs Tipper looked depressed, not to say unhappy; whilst I myself felt uncomfortable without being able to trace the cause, unless it arose from sympathy with the others. In vain did I

try to account for the change. There was certainly no unkindly feeling betwixt us; indeed I think we were each and all more carefully considerate of each other's feelings than we had hitherto been, displaying a great deal more anxiety to prove that the strength of our attachment to each other was as undiminished as ever.

I felt no shade of difference in my own sentiments; I knew that I felt towards them precisely the same as before, although I was gradually adopting their tone. What troubled me most of all was the reserve growing up between Lilian and me. I tried more than once to break through it; but her real distress—her tears, as she clung to me, entreating me to believe in her love, pained without enlightening me. And when I a little impatiently replied that it rather seemed as though she did not believe in my love, it only brought more tears and distress.

She now frequently excused herself from accompanying Philip and me in our walks and excursions; and shut herself up in her own room many hours during the day. The explanation that she had taken a fancy for studying French history, was not a satisfactory one to me. True, there was evidence that she was diligently plodding through a certain amount of work; but why should that separate us? The studies she had hitherto undertaken had not shut me out of her confidence. She had often declared that the greater part of the enjoyment of such work was to compare notes with me upon the subjects we were reading; and why should French history be an exception?

I was beginning to lose patience—mystery has ever been and ever will be provoking to me—and one evening, when Robert Wentworth asked me some questions about our work, I irritably replied that he must ask Lilian; I could only answer for myself now.

'I am only doing a little French history,' she faltered, becoming very pale, and presently making an excuse for leaving the room.

'What is it? What has so changed her?' I asked, turning towards him.

'I do not observe any particular change,' he replied, lowering his eyes before mine.

'Pray do not you become as mysterious as the rest,' I said angrily.

But he *was* mysterious. Even Robert Wentworth, who had always been so outspoken and unsparing, was becoming considerate even to politeness. He made no reply, standing before the open window, apparently absorbed in thought. I was about to add some little remark that I had hitherto trusted to his friendship, in a tone meant to be caustic, when I caught sight of his face, and shrank into my shell again. What made him look like that? What did it mean? And why did he so hurriedly take his departure the moment old Mrs Tipper came into the room, in a manner as unlike the Robert Wentworth of the past as it was possible to be?

But it must not be supposed that I was going to succumb to this state of things. Before I succumbed, I must know the reason why. It would take a great deal yet to make me lose hope. I had too much respect for them and belief in the power of my own love, to be without hope of succeeding

in dissipating the clouds which had gathered about us. The one thing to be done was to find out *what it was* that had come between us. Could I once find out that, I should not despair of the rest. After some anxious reflection, I fancied that I had discovered the cause of the alteration in Lilian's bearing, and took Philip into my confidence.

He listened gravely, I thought even anxiously, and yet he did not appear to think it necessary for me to make any attempt to alter things.

'If—she prefers being more alone, I think—Wouldn't it be best not to interfere, Mary?'—hesitatingly.

'If I did not care for her, perhaps it would be better not to interfere, as you term it,' I hotly rejoined. 'But as it happens, I do care for her, and therefore I cannot see her so changed without making some effort to help her.'

'No one could doubt your love for her, Mary,' he replied in a low voice, laying his hand gently upon mine.

'Then how can I help being anxious, especially when I see that it is not good for her to be moping alone? Any one might see that it is doing her harm. Cannot you see the difference in her of late?' He made no reply; and taking his assent for granted, I went on: 'Do you know I am sadly afraid that she is fretting'—I did not like to say plainly about Arthur Trafford, but added: 'She is beginning to look just as she did in the first shock of finding that she had lost Arthur Trafford!—Ah, spare my roses!'

He was mercilessly, though I think unconsciously, tearing to pieces a beautiful bunch of light and dark roses, which had been given to me by one of the cottagers, scattering the leaves in all directions.

'I—beg your pardon.'

'I really think you ought, sir!' was my playful rejoinder. 'If my path is to be strewn with roses, we need not be so extravagant as that about it. I shall not trust you to carry flowers again.'

He remained so long silent, standing in the same position, that I was about to ask him what he was thinking of, when he impetuously turned towards me, and hurriedly said: 'Why should there be any longer delay, Mary? Why cannot our marriage take place at once—next week? For God's sake, do not let us go on like this!'

'Go on like this!' I repeated, looking up into his face. 'Go on like this, Philip?'

'Say it shall be soon—say when?' catching my hands in both of his with a grip which made me wince, as he hurriedly continued: 'Why do you wish all this delay?'

Had it been spoken in a different tone—had he only *looked* differently! I tried to believe that it was the eagerness of happiness in his face; but alas! it looked terribly like misery! For a moment my heart stood still in an agony of fear; then I put the disloyal doubt aside, telling myself that it was my too exalted notions which had led to disappointment. I had expected so much more than any woman has a right to expect; and so forth. Then after a moment or two, I honestly replied: 'I do *not* wish it, Philip. Of course I will say next week, if you wish it; and'—with a faint little attempt at a jest—'if you do not mind about my having fewer furbelows to pack?'

'I do wish it; and—and—until then I must ask you to excuse my not coming down quite so regularly. So much to arrange, you know,' he

hastily continued, 'in case we should take it into our heads to remain abroad some time.'

'Yes; very well,' I murmured, as one in a dream. It was all so different—so terribly different from anything I had expected.

But I soon persuaded myself that the fault, if fault there were, must be mine. How could *he* be changed—or if he were, why should he so eagerly urge me to delay our marriage no longer?

As if to rebuke my doubt, he turned towards me and gently said: 'God grant that I may be worthy of you, Mary! You are a good woman. I must hope in time to be more worthy of you.'

I was conscious that just then I could have better borne a loving jest at my imperfections than this little set speech of praise. I never before cared so little about being a 'good woman' as I did at that moment. But I told myself that I would not be critical—how horribly critical I seemed to be growing! So I looked up into his face with a smile, as I said something about his being perfect enough for me.

'You are good.'

'Oh, please do not say anything more about my goodness!'

There was another pause; and then he said: 'I think you mentioned that you wished it to be a quiet affair, Mary, and at the little church in the vale—St John's, isn't it called?'

'Yes, Philip.'

'And you must let me know what I ought to do besides procuring the ring and license. I am sure you will give me credit for wishing not to be remiss in any way, and will not mind giving me a hint if I appear likely to fall short in any of the—proper observances.'

Proper observances! How coldly the words struck upon me!

'Shall you not come down *once*, Philip?' I murmured.

'Once? O yes, of course; and—you can give me any little commission by letter, you know.'

Then looking at his watch, he found that he might catch the eight o'clock train, and *hastily* bade me good-night; asking me to excuse him at the cottage, and tell them about our plans.

'Eh bien, Philippe,' I returned, more disappointed than I should have cared to acknowledge at his not asking me to accompany him the remainder of the distance to the stile, to which I always walked with him when Robert Wentworth was not with us. Moreover, I thought that the parting kiss was to be forgotten. I believe that it *was* forgotten for a moment. But he turned back and pressed his lips for a moment upon my brow.

'Good-night, Mary. God grant I may be worthy of you!'

'Good-night, Philip,' I faltered.

As in a dream I walked down the lane, entered the cottage, and turned into the little parlour, not a little relieved to find no one there.

The heat was almost stifling, the swallows flying low beneath the lowering sky, and there was the heavy stillness—the, so to speak, pause in the atmosphere which presages a coming storm. The windows and doors were flung wide open; and I could hear Mrs Tipper and Becky talking to each other in their confidential way, as they bustled in and out the back garden, fetching in the clothes, which the former always put out to 'sweeten,' as

she termed it, after they were returned from the wash. Lillian was, I suppose, in her own room, as her habit was of late.

Throwing off my hat, I sat down, and with my hands tightly locked upon my lap, I tried to think—to understand my own sensations, asking myself over and over again what was wrong—what made me like this? half conscious all the while of a discussion over a hole in a tablecloth, that ought not to have been allowed to get to such a stage without being darned.

'A stitch in time saves nine, you know, Becky; never you leave a thin place, and you'll never have a hole to mend;' and so on.

Suddenly, as my eyes wandered aimlessly about the room, they fell upon some documents on the table referring to the sale of Hill Side, which Philip had brought down to shew us, and which I knew he had intended to take away. Reflecting that he was very desirous of completing the purchase, that the delay of a post might make a difference, and that I might yet overtake him if I were quick, I hurriedly caught up the papers in my hand and ran down the lane towards the stile. Have I mentioned that there was a sharp curve in the lane before it reached the stile, so that you came close upon the latter before it was in sight? I had just arrived at the curve when the sound of voices reached me; and recollecting that I had not waited to put my hat on, and not wishing to be recognised by any one, I paused a moment to draw the hood of my cloak over my head.

Robert Wentworth and Philip! I had time for a moment's surprise that the former should be there when we had not seen him at the cottage, before Philip's words reached me: 'And you have been waiting here to say this to me. But I am not so base as that, Wentworth! I have just begged her to be my wife at once, and she has consented. She suspects nothing.'

'Thank God for that!' ejaculated Robert Wentworth.

I could not have moved now had my life depended upon it—though my life *did* seem to depend upon it. 'Suspect what? What was there to suspect?' I asked myself in a bewildered kind of way.

'God grant that she may be always spared the knowledge!'

'She shall be, Wentworth, if it be in my power to spare her.'

'Great heavens! that it should be possible to love another woman after knowing her! Man, you never can have known her as she is, or it would be impossible for another woman to come between you. The other is no more to be compared'—

'Respect her, Wentworth; blame me as you will, but respect Lillian.'

'Lillian!' I muttered—'Lillian!'

'She is, I think—I trust, utterly unconscious of my—madness. But if she knew, and if she cared for me, she would be loyal to the right. You ought to be sure of that, knowing what her love for Mary is, Wentworth.'

'Yes; she is true; she will try to be true. But it is quite time that'—

I knew that the voices sounded fainter and fainter, and that the sense of the words became lost to me, because they were walking on; I knew

that they were great drops of rain and not tears pattering down upon me where I lay prone upon the ground; and I could recollect that the papers must not be lost; so I had kept my senses.

THE STORY OF THE QUIGRICH OR STAFF OF ST FILLAN.

THE recent acquisition of that curious medieval work of art called the Quigrich or crosier of St Fillan by the Society of Antiquaries of Scotland, and its final deposit in their National Museum at Edinburgh, is in itself an incident of more than ordinary interest. Apart from its historical associations, the 'Cogerach,' 'Coygerach,' or 'Quigrich,' as it is variously styled in writings of the fourteenth and fifteenth centuries, is unsurpassed in interest as a work of art of a class and period of which no other Scottish specimen is now known to exist. Briefly described, it is simply the massive silver head of a pastoral staff of the form peculiar to the Celtic Church in very early times. Its shape resembles that of the bent head of a walking-stick, with a slanting prolongation of the outer end. The lower part of the crook expands into a large bulbous socket, beautifully ornamented with interlaced knot-work. A ridge or crest, pierced with quatrefoils, rises from the socket, and is continued over the back of the crook, terminating in the bust of an ecclesiastic, probably meant for St Fillan. The slanting front of the staff-head is ornamented by a large oval setting of cairngorm, and the terminal plate has an engraved representation of the Crucifixion. The body of the crook is covered with lozenge-shaped plaques of filigree-work in floral scrolls.

What may be termed the private history of the crosier commences in the early part of the eighth century, when as the *bacul* or walking-staff of St Fillan, it accompanied him in his missionary journey to the wilds of Glendochart. The saint came of a royal race. His mother, Kentigerna, was a daughter of the king of Leinster; and both she and her brother St Comgan are enrolled among the saints of Celtic Alba. Placed often in the darkest and wildest districts of the country, solely with the view of reclaiming the people from paganism and diffusing the benefits of Christian civilisation, these monastic churches were truly centres of light and progress. Such was the famous church of Columcille at Hy. Such also was the monastery of St Maud at the Holy Loch, where St Fillan spent part of his days, and in which he succeeded the founder as abbot. Growing weary of its comparatively peaceful life, he sought a desert for himself in the wilds of Glendochart, where he might reclaim a new garden for the church, and close his days among an ecclesiastical family of his own uprearing. As founder and first abbot of Glendochart his memory would be fondly cherished by the community of clerics over whom he had presided. Their veneration would increase with time, as the traditions of his saintly life became fixed by constant repetition; and there

was no object around which that veneration and these legends could more appropriately cluster than around the staff which was the symbol of his abbatial office, and the lasting memorial of his presence among them.

Not the least interesting of the many picturesque associations which gather round the crosier of St Fillan is that which connects it with Scotland's warrior-king, Robert Bruce, and assigns to it a prominent part in the great struggle for Scottish independence that culminated in the glorious victory of Bannockburn. There is no evidence on record by which we can positively prove the presence of the crosier on the eventful field; but it is the tradition of the Dewars, its hereditary keepers, that it was there; and there is evidence that certain other relics of St Fillan were brought to the battle-field by the abbot of Inchaffray, the ecclesiastical superior of the church of Strathfillan, who was the king's confessor; and that this was done, if not by the king's express desire, at least in the knowledge that it would be consonant with his personal feelings and belief in their efficacy. If the narrative that was written by Boece is to be accepted at all, it must be accepted to the extent of establishing that there was a relic of St Fillan at Bannockburn. He calls it the arm-bone of the saint, and tells in his picturesque way that when the king, being sorely troubled in mind on the evening before the battle, had retired into his tent, and was engaged in prayer to God and St Fillan, suddenly the silver case which contained the arm-bone of the saint opened of itself, and shewed him the relic, and then 'clakkit to again.' The priest who had charge of it immediately proclaimed a miracle, declaring that he had brought into the field only the 'tume cais' (empty case), being fearful lest the precious relic should fall into the hands of the English.

If we accept Boece's statement to the extent of believing on the strength of it that any of the relics of St Fillan were brought to the field, we may believe that they were all there, and that they were carried round the army on the morning of the fight, when the abbot of Inchaffray walked barefooted in front of the ranks bearing aloft 'the croce in gulihik the crucifix wes hingin.' That such practices were not uncommon is gleaned from other instances, such as that of the crosier of St Columba—the *Cath Bhuidh* or 'Battle-Victory'—so named because it used to give the victory to the men of Alba when carried to their battles. If then the crosier of St Fillan was present at the battle of Bannockburn, and the victory was ascribed to the saint's intervention, this may have been the occasion of its being glorified with such a magnificent silver shrine.

But if it had no public history and no picturesque associations, the story of its transmission from age to age, linked as it was with the chequered fortunes of the religious foundation to which it was attached, and of the strange and varied circumstances in which it has been preserved by a succession of hereditary keepers, through failing fortunes and changes of faith, in poverty and exile, is sufficient to invest it with surpassing interest.

Since its arrival at Edinburgh the singular discovery has been made that the gilt silver casing of the crosier had been constructed for the purpose of

inclosing an older staff-head of cast bronze. This has been taken out of its concealment, and is now exhibited alongside the silver one. The surface of this older crosier is divided into panels by raised ridges ornamented with niello. These panels correspond in number, shape, and size to the silver plaques now on the external casing, and they are pierced with rivet-holes which also correspond with the position of the pins by which the plaques are fastened. It is thus clear that when the old crosier was incased, it was first stripped of its ornamental plaques of filigree-work, which were again used in making up the external covering so far as they were available. Such of them as had been either entirely absent, or so much worn as to require redecoration, were renewed in a style so different from the original workmanship, as to demonstrate that it is a mere imitation of an art with which the workman was unfamiliar. This establishes two distinct phases in the history of the crosier, and suggests that at some particular period, a special occasion had arisen for thus glorifying the old relic with a costly enshrinement. What that occasion was may be inferred from some considerations connected with its public history.

We know nothing of the history of St Fillan's foundation during the first five centuries, in which the founder's staff passed through the hands of his various successors as the symbol of office of the abbot of Glendochart. But in the time of King William the Lion, we find that the office had become secularised, and the abbot appears as a great lay lord, ranking after the Earl of Athole, and appointed alternatively with him as the holder of the assize, in all cases of stolen cattle in that district of Scotland. Whether he held the crosier in virtue of his office we cannot tell; but the likelihood is that it was when the office was first usurped by a layman, that the crosier was placed by the last of the true successors of St Fillan in the custody of a 'dewar' or hereditary keeper, with the dues and privileges which we afterwards find attached to this office. Such an arrangement was not uncommon in connection with similar relics of the ancient Celtic church. We thus find the dewar of the Cograch of St Fillan in possession of the lands of Eyich in Glendochart in 1336. In process of time the official title of dewar became the family surname of Dewar; and we have a curious instance of the Celtic form of the patronymic in a charter granted in 1575 by Duncan Campbell of Glenorchy to Donald Mac in Deora vic Cograch.

The inquiry is naturally suggested why a relic with such associations, intrinsically so valuable, and always so highly venerated, should have been allowed to remain in the possession of laymen, and to be kept in their private dwellings, often no better than turf cottages in the glen. The crosier was splendid enough to have graced the processional ceremonials of the highest dignitary of the Church, and thus to have been a coveted acquisition to the richest monastery in the land. That it was so coveted may be fairly inferred from the fact that on the 22d April 1428, John de Spens of Perth, Bailie of Glendochart, summoned an inquest of the men of Glendochart to hold inquisition regarding the authority and privileges of 'a certain relick of St Felane called the Cograch.' Of the fifteen summoned, three were Macnabs,

deriving their origin from the son of a former abbot; three were of the clan Gregor; and one was named Felan, after the saint. Their verdict sets forth that the Coggerach was in the rightful possession of the deoire, because the office of bearing it had been given hereditarily by the successor of St Fillan to a certain progenitor of Finlay, the deoire at the time of the inquest; that the privileges pertaining to the office had been enjoyed and in use since the days of King Robert Bruce; and that when cattle or goods were stolen or taken by force from any inhabitant of the glen, and they were unable to follow them from fear or feud, the dewar was bound to follow the cattle or goods wherever they might be found throughout the kingdom.

We hear no more of the rights of the Coggerach till 1487, when the dewar sought the sanction of the royal prerogative to aid him in holding his charge with all its ancient rights. In that year, King James III. issued letters of confirmation under the Privy Seal, in favour of Malice Doire, who, as the document sets forth, 'has had a relic of St Felan called the Quigrich in keeping of us and our progenitors since the time of King Robert Bruce, and of before, and has made no obedience or answer to any person spiritual or temporal in any thing concerning it, in any other way than is contained in the auld infeftment granted by our progenitors.' The object was to establish the rights of the Crown in the relic, as distinguished from the rights of the Church; and we may presume that the royal infeftment to which it refers may have been granted by Bruce on the occasion when the old crosier was glorified by incasement in a silver shrine, in token of the king's humble gratitude to God and St Fillan for the victory of Bannockburn.

We find traces of the dewars and their lands in charters down to the time of Queen Mary. The Reformation deprived them of their living, and converted the relic, of which they were the keepers, into a 'monument of idolatry,' fit only to be consigned to the crucible. Still they were faithful to their trust, although instead of emolument it could only bring them trouble. In the succeeding centuries their fortunes fell to a low ebb indeed. In 1782 a passing tourist saw the Quigrich in the house of Malice Doire, a day-labourer in Killin. His son, a youth of nineteen, lay in an outer apartment at the last gasp of consumption; and the traveller was so moved by concern for the probable fate of the Quigrich, in the prospect of the speedy death of the heir to this inestimable possession, that he wrote an account of the circumstances, and transmitted it, with a drawing of the crosier, to the Society of Antiquaries of Scotland. At that time the Society could not have acquired it; but fortunately their intervention was not necessary for its preservation. On the failure of the older line, by the death of this youth, the relic passed into the hands of a younger brother of Malice Doire's. His son removed to Glenartney, where the Quigrich was again seen by Dr Jamieson, and was described by him in his edition of Barbour's *Bruce*. Archibald Dewar removed from Glenartney to Balquhiddy, where he rented a sheep-farm; but having suffered heavy losses at the close of the French war in 1815, he emigrated to Canada, where he died, aged seventy-five.

His son, Alexander Dewar, the last of the hereditary dewars of the Crosier, is a hale old man of eighty-eight, in comfortable circumstances, the patriarch of a new race of Dewars, rejoicing in upwards of thirty grandchildren, and nephews and nieces innumerable. It is in consequence of his desire to see the ancient relic returned to Scotland before he dies, and placed in the National Museum at Edinburgh, 'there to remain in all time coming for the use, benefit, and enjoyment of the Scottish nation,' that the Society of Antiquaries has been enabled, partly by purchase and partly by his donation, to acquire the Quigrich, the most remarkable of all existing relics associated with the early history of the Scottish nation.

It was five centuries old before the light of authentic record reveals it in 1336 in possession of the dewar Coggerach, and since then it can be traced uninterruptedly in the line of the Dewars for five hundred and forty years. 'Its associations with the Scottish monarchy,' says Dr Daniel Wilson, 'are older than the Regalia, so sacredly guarded in the castle of Edinburgh; and its more sacred memories carry back the fancy to the primitive missionaries of the Christian faith, when the son of St Kentigerna, of the royal race of Leinster, withdrew to the wilderness of Glendochart, and there initiated the good work which has ever since made Strathfillan famous in the legendary history of the Scottish Church.'

COUSIN DICK.

Mr and Mrs Woodford were enjoying a confidential matrimonial chat over their *tête-à-tête* dessert, and discussing at some length the antecedents and probable future of a cousin, Mr Richard Broughton, who had lately dropped down on them, not from the clouds, but from a Liverpool express train. This gentleman had in his youth been 'crossed in love.' Always a musical enthusiast, he had become attached to an amiable girl, a young concert-singer, who was the main stay of her mother—the widow of a captain in the army—and some younger sisters; and having himself not yet made a fair start in life, the elders of both families rose up in arms against the alliance.

Mrs Woodford, of nearly the same age as her Cousin Dick, had been his confidante in their boy and girl days, had sympathised warmly with his disappointment, without very precisely understanding how it had come about, and was now assuring her husband that the attachment had been a far more serious affair than very youthful fancies commonly are. It was true the gentleman had so far consoled himself as to marry another lady; though it was reported he had wedded a shrew, who had not made him supremely happy. But he lost his wife some time before leaving Australia; and now, after a sojourn of nearly twenty years in the colonies, had returned to England with something more than competence.

'But what became of Miss Clifton?' asked Mr Woodford.

'That I do not know,' returned the lady. 'Clifton was only her professional name; her real one I quite forget; therefore if from any circumstances she passed into private life, it would not be easy to track her. Dick only called her Alice to me.'

'Probably she also married,' said Mr Woodford. 'Possibly,' replied his wife; 'though women are more constant than men; and though she ceased to answer Dick's letters, and really brought him to a state of misery which drove him out of England, I never thought the fault was quite her own.'

While Mrs Woodford was yet speaking, there was a knock at the door, and Mr Broughton was announced.

'Why did you not come to dinner?' cried Mr Woodford, rising to greet the visitor. 'But we can have the lamb brought back,' he added.

'Thanks, thanks,' said Mr Broughton; 'but I dined at the hotel. I am sure I ought to apologise for calling at such a time, and for having brought Dandy with me.'

Dandy was a terrier, and his master's almost inseparable companion.

'Now Dandy, behave!' continued his master; 'and go and beg pardon for both of us. Say we know we are two unmannerly colonial bores, at present unfit for good society.'

Very much as if the sagacious animal understood every word of this address, he approached Mrs Woodford, and sat on his haunches in a begging attitude.

'He means biscuit,' said the lady with a laugh, and suiting the action to the word by giving him one, with a caressing pat into the bargain.

'Seriously, however,' said Mr Broughton, 'I would not have come at such an hour, but I wanted so much to tell you that at last I have found lodgings which I think will just suit me. Or rather I should say that Dandy found them for me.'

'Dandy! Well, he is a clever dog! He will talk next, I suppose. But,' continued Mrs Woodford, 'at present his master must explain.'

'It sounds ridiculous perhaps to tell of such trifles,' replied her cousin; 'but for the last three or four days—ever since the hot weather set in, I have felt quite interested in a shop in your neighbourhood—mainly, I think, from the humanity displayed by the owner in setting a large bowl of sparkling water by the door for the convenience of the poor panting dogs, for which Dandy has been grateful more than once. It is a music warehouse on a small scale; but where they also sell fire ornaments and ladies' Berlin work and so on.'

'I know the shop,' interrupted Mrs Woodford; 'it is kept by a widow and her maiden sister, who seem very superior people.'

'Oh, I am glad you know the place,' continued Mr Broughton. 'Well, this afternoon as usual I waited, looking in at the shop window, while Dandy quenched his thirst, and wishing I could decide on something to purchase, by way of liquidating my dog's debt, when I observed a card which intimated there were apartments to let. There were directions to knock at the private door; but seeing me linger on the spot longer than usual, Dandy had entered the shop, and when I followed to look after him, I saw him planted firmly near an inner door, and accepting the caresses of a little girl of about seven years old as if he had known her all his life. I made inquiries about the apartments, and found they consisted of the first floor, a nice bedroom, and pleasant sitting-room; attendance with good cooking guaranteed, and no other lodgers taken. Of course I went upstairs to look at the rooms, Dandy leading the

way with the canine gravity which you remarked in him the other day. He jumped on a chair to look out of the window, and then on the sofa, as if to examine the softness of the cushions, and finally gave a little yelp, which was only half a bark, and which seemed to say: "Master, this will do; here we are quite at home." Even the mistress of the house, Mrs Gray, laughed at the evident contentment of the dog. But what charmed me was there was no rebuke for my poor Dandy's jumping on the furniture; and remembering besides the bowl of water, I felt inclined to believe that Dandy would be something more than tolerated in the house. Accordingly it was with a good hope that I intimated that my dog was my constant companion, and that I trusted his presence would not be objectionable.'

'O sir,' said the widow, 'we have only lost a dear old dog within these three months; and for our own poor pet's sake—if for nothing else—we should be kind to a dog. As for my children, I believe they take after their aunt; and my sister dotes upon dogs.'

'Ah, it was the maiden sister, I daresay, who was the mistress of the lamented dog,' exclaimed Mrs Woodford. 'I have some recollection of seeing a very old black retriever in the shop.'

'No doubt it was the same. I understand the sister gives music lessons; though at present she is taking a little holiday, staying at the seaside with friends. There is another advantage in these lodgings,' continued Mr Broughton; 'the house being a music warehouse, and one of the family evidently musical, I am in hopes they will not object to my violin-practising any more than to Dandy for an inmate. What I want now is comfort, to enjoy myself after my own fashion, and opportunity of doing some little good in the world, when what seems to me the fitting occasion offers. Five years more at the Antipodes and I might have come home a richer man; but perhaps in that time health would have been shattered by over-toil, and I should have been less able even than now to turn into new grooves of life and resume habits of culture. As it is, my means are ample for all I am likely to want. With books and music and Dandy, I expect to get on capitally. Besides I mean to come and see you pretty often.'

'Indeed I hope you will,' ejaculated husband and wife together.

'If we come too often, they must turn us out—must they not, Dandy?' said Mr Broughton, speaking to and petting his dog; and then he added, turning to his cousin: 'By-the-bye, I ventured to give you as a reference as to my respectability, responsibility, &c.'

'And I will give you a good character, Dick, I promise you,' replied Mrs Woodford; 'and what is more, I will recommend Dandy to Mrs Gray's special regard. He certainly is the cleverest dog I ever saw. Look at him now, wagging his tail at me, as if he understood every word I was saying!'

'Spoken just like the Cousin Maggie of early days,' said Mr Broughton, with a certain tremor in his voice which proved that his feelings were touched. 'Always full of sympathy and thoughtful kindness. Yet even you can hardly tell what a friend Dandy has been to me through years of loneliness.'

'Yes, I can, Dick,' said Mrs Woodford; 'if I had not a pack of children to think about, I am quite sure I should want dogs or four-footed pets of some sort.'

Only a fortnight has passed, but 'Cousin Dick' seems as completely installed in his new lodgings as if he had occupied them for months. His most cherished personal belongings were all unpacked and arranged about his rooms according to his own taste and fancy. A few well-worn books which he had taken from England in his youth, still held a place of honour, though they were now flanked by many fresher-looking volumes; and an old and cherished violin rested in one corner, and helped to give the sitting-room its inhabited look, though writing materials near the window and newspapers lying about, contributed to the effect.

Over the mantel-piece in his bedroom he had arranged his store of warlike weapons—a sword, which Richard Broughton had certainly never used, but which he valued as the gift of a dead friend; pistols and revolver which he had looked on as protectors in many a perilous journey, and a boomerang, brought to England as a curiosity.

Mr Broughton had finished his breakfast, and was enjoying his morning newspaper; but he had been to the opera the night before, and the melody of an air which had delighted him still haunted his ear, and even disturbed the rhythm of the very didactic leading article he was reading. He was not much disturbed by Mrs Gray's knocking at the door; she came, as she usually did every morning, to receive his orders for dinner.

'You manage my dinners so nicely for me,' said Mr Broughton in answer to some suggestion of his landlady, 'that I think I cannot do better than leave all arrangements to you. But do sit down; I want to thank you for taking care of my dog last night. I hope he was not troublesome to you?'

'Not in the least,' returned Mrs Gray: 'when once he ascertained that you really were not in the house, he settled down quietly, and played with the children till they went to bed.'

'I am so glad your children are not afraid of him,' observed Mr Broughton.

'Oh, they are too well used to a dog and to pets in general to be afraid of a gentle creature like your Dandy. In fact my difficulty is keeping them out of your rooms. Ally—you remember how Dandy took to her from the very first—Ally wanted to come in and see the dog just now. I daresay she is near the door still.'

'Oh, pray let her in,' said Mr Broughton, himself rising to open the door. 'I will not be jealous because it is my dog she wants to see—not me;' and there was a little laugh at the idea of Dandy being such a favourite.

When the room-door opened, sure enough little Ally was found waiting, but not alone; her brother, a curly-headed pratin two years her junior, had hold of her hand; and both were evidently in expectation of being allowed some little frolic with the dog.

'Come in, my dears—come in,' exclaimed Mr Broughton; 'Dandy will be most happy to see you, and will show you some of his accomplishments, if you like.'

Though a little shy at first with the 'strange gentleman,' whom they had been taught in a vague

sort of way to reverence, and for whose comfort they were told to refrain from noise, the shyness soon wore off, when they found that Dandy's master was as willing to be their playmate as Dandy himself. For their delectation the dog went through his most admired tricks: he jumped over a stick, he allowed of mimic shooting and acted the dead dog, he begged for a piece of bread, but could not be induced to eat it till assured it was paid for. Moreover, he howled a note in unison with one his master played on the violin; but probably without meaning to imply admiration of the latter performance.

A less keen observer than a fond and widowed mother was likely to be, might, if contemplating this little scene, have felt pretty sure that fond as Richard Broughton was of his dog, it had not exhausted *all* his capacity of loving. By people who have never had their hearts thrill to the mystery of canine attachment he had often been ridiculed for the intensity of his affection for Dandy, and when he spoke of a 'dog's love' as being the only ideal of his life that had ever been fully realised, few persons understood him. But Mrs Gray saw at a glance that he had a natural love for children, and probably for all helpless creatures, and considering all the circumstances of her household, she thought herself most fortunate in her lodger.

It is astonishing how soon pleasant habits may be formed. Before the next week had passed it became quite the custom of the children to come into Mr Broughton's rooms at least once a day, ostensibly to play with Dandy; but also they brought their toys to shew to Dandy's master, and chattered away, as bright, eager, fresh-hearted children are pretty sure to do with those whom, by some subtle instinct, they at once recognise as friends. Dandy's canine predecessor in the house, the much lamented Topsy, was a frequent subject of conversation. Her accomplishments were described, though admitted to be fewer than Dandy's, and her death and burial dwelt on with some pathos. And one day little Ally came into the room hugging a thick photographic album in her arms. She had brought it for the express purpose of shewing poor Topsy's likeness.

Topsy had been photographed a number of times: once cosily curled up on a mat; once occupying an easy-chair with something of the dignity of a judge; another time as a conspicuous member of a group; and lastly by the side of a lady who had her hand on its head.

'And who is the lady?' inquired Mr Broughton, trying to speak with a calmness he did not quite feel. 'It does not look like your mother.'

'O no! Why, it is auntie!' exclaimed little Ally in a tone which implied wonder that he could for a moment have taken it for Mrs Gray.

'Then Topsy was fond of auntie, and auntie was fond of Topsy, I suppose?' said Mr Broughton, wishing to discover all he could about this auntie.'

The little girl nodded her head by way of reply, and then she said: 'Auntie did cry so much when Topsy died. She was auntie's own doggy.'

'And did you cry?' asked Mr Broughton.

Another nod of the head; but the child exclaimed: 'Not so much as auntie—auntie cried till her eyes were quite red.'

'And is this portrait very like auntie?' asked Mr Broughton.

'Yes; but she never wears such sleeves as those

now. I'll shew you her new photograph ;' and the little fingers rapidly turned over leaves and found a likeness taken only the other day. Mr Broughton recognised the same sweet face, though it shewed that seven or eight years had probably passed between the time the one photograph had been taken and the other.

'And what is auntie's name?' inquired Mr Broughton with forced composure.

'Auntie!' said the little girl, as if the word were quite sufficient; but added a moment after, as if the thought of more information being required had just come to her: 'She is Alice, and I am Alice; only they call me Ally. Auntie is so good,' the child continued; 'mother says she is the best auntie that ever lived. And I must try to be good too, because I have got her name.'

'Quite right, my darling,' said Mr Broughton, giving the child a fatherly kiss. 'But run away now, for I have letters to write. Will you leave me the album; I should like to look at Topsy again—though I don't think she was much like Dandy. Do you?'

'Not a bit!' cried the child, tripping off gleefully, and leaving Mr Broughton with his heart stirred in a manner it had not been for many years.

It was true that he had letters to write, but it was half an hour before he took pen in hand. The first thing he did was to draw forth a powerful magnifying glass, and by its means to study the face of the lady with the dog most narrowly. Yes; he had not a shadow of doubt that this dear 'auntie,' the maiden sister of Mrs Gray of whom he had heard, was the love of his youth, the Alice Clifton of the concert-room, the Alice Croft of private life. Photography revealed some lines of care and suffering that had not belonged to the fair young face he so well remembered; but such foot-marks of time must be expected in the course of twenty years, even under happier circumstances than had probably befallen the woman in question. That she should have relinquished her professional career without having married, puzzled him. But he had incidentally heard from the children that 'auntie' was coming home to-morrow; and before many days should pass, he would certainly find out a thing or two which must greatly influence his future.

As if to confirm his already strong belief beyond the power of even momentary cavil, the next time he went down-stairs he observed a letter on the hall table, which, on looking if it were intended for himself, he saw was addressed 'Miss Croft.'

The next day Alice Croft returned home; and as Broughton was taking his coffee, he could hear the children's merry shouts of welcome, at which, by-the-bye, Dandy set up a short bark, as if he thought he too had a right to join in the demonstration.

'I will do nothing hurriedly,' thought Mr Broughton to himself; 'after twenty years of separation I can wait for a few days surely. After all, if we meet on the stairs she will not recognise in me the slim smooth-faced boy I believe she remembers.' And thinking thus, he glanced at himself in the chimney-glass, noting the bronzed weather-beaten face and long thick beard streaked with white that it reflected. 'I wonder, though, if my name will strike her?' he continued, pondering. 'Perhaps not; and yet it may.'

Now the fact was, Alice Croft had not as yet

heard the new lodger's name; for her sister had at first misunderstood it, and had written it 'Rawton' in communicating the news that the rooms were let. Three or four days passed away before Alice had any inkling of the mistake. Meanwhile Richard Broughton had seen her—unseen himself—more than once; and had even heard her voice speaking caressingly to the children. How it thrilled on his ear and confirmed his resolution!

It was the early twilight of a summer evening. The shop was closed, and Mrs Gray had gone out after seeing the children in bed. Broughton felt that the hour was come, and ringing his bell, asked the servant who answered it if Miss Croft were at home and disengaged.

'Yes, sir,' said the maid; 'she is all alone in the parlour.'

'Then be so good as to give her my card, and ask if I may wait upon her.'

But Mr Broughton followed the servant down-stairs, and was ready to avail himself of the permission given, in a minute.

The servant thinking it her duty, lighted the gas before leaving the room; but she left it burning low, so that the lingering daylight prevailed over it. Though the reception-room was but a little parlour behind a shop, there was an air of refinement about its appointments, and the outlook into a mere yard was masked by a balcony full of blooming and odorous plants. The door which led into the shop remained open, probably for the sake of air; but to such a passionate lover of music as the visitor was, the sight of two or three pianos and a harp and guitar was rather suggestive of delightful ideas than of anything else.

Alice had risen from her chair, and advanced with outstretched hand to meet her guest; but she did not seem able to find a word of greeting.

'Alice!' exclaimed Mr Broughton, 'if I may still call you so, do I seem like one risen from the dead?'

'O no,' she replied; 'I never thought you were dead.' But as she spoke there was a faltering of her voice which shewed that she was agitated.

By this time both were seated, though a little way apart. Mr Broughton drew his chair nearer, and said softly: 'Alice, I come to ask you if it is too late to mend our broken chain?'

'But you are married; I heard that long ago,' exclaimed Alice with dignity. 'You have no right to allude to the past.'

'I have been a widower these two years,' was the rejoinder.

The explanations which followed need not be described in detail.

Letters kept back, false messages,
The tale so old and dark,

had separated the lovers; and when Alice Croft believed that she was forsaken, a severe illness ensued; after her recovery from which, it was found that her voice was seriously impaired. Instead of resting it for a time, she was tempted by the exigences of her profession to overstrain it; the result being such a deterioration in its quality that it was no longer powerful and certain enough for the concert-room. Then followed many years of arduous labour as a teacher of music; during which time her mother's death and the death of other members of the family reduced the little

circle, till at last her youngest and widowed sister Mrs Gray was the only one left.

Six weeks after the reunion just described, a quiet but well-omened wedding took place, in which Richard Broughton and Alice Croft were the principal actors. Meanwhile, the bridegroom and bride elect, living under the same roof, had had abundant opportunities of riveting the 'broken chain' to which allusion has been made; while Dandy, no longer confined to one apartment, now ran about the house, as if perpetually engaged in taking messages from one person to another. Mr and Mrs Woodford, early apprised of all that was going on, had made the acquaintance of Miss Croft and her sister, and being fond of children, had frequently had the little Grays at their house. Mr Woodford even consented to give the bride away, and his two young daughters were the bridesmaids. But as Broughton said, his cousin Maggie was always a 'trump,' and her husband seemed worthy of her.

It was the evening before the wedding. The whole family had been visiting the Woodfords, and it was evident that little Ally had something on her mind to communicate. The young Woodfords as well as their mother constantly called Mr Broughton 'Cousin Dick,' and the term had evidently struck the child much.

'What is it, Ally?' said Mr Broughton, drawing the little girl on to his knee. 'What is it you are wishing to say?'

'I should like to call you "Cousin Dick," like those young ladies. May I? for I love you so much.' And as she spoke, Ally raised her face for a kiss, and put her arms round his neck.

'Will not "Uncle Dick" do as well?' cried Broughton, giving the child a warm hug. 'Don't you understand that I shall be really Uncle Dick to-morrow?'

'Oh, how nice! Uncle Dick, dear Uncle Dick—yes, I like that better.'

N.B.—We are commissioned to add that Dandy accompanied the newly married pair on their wedding journey. They considered they owed him so much, that it would not be just to give him the pain of even a temporary separation from his master—and mistress.

A TRIP ON LAKE NYASSA.

As many of our readers will doubtless recollect, Mr F. D. Young, R.N., left this country in May 1875, with a small party, for the purpose of establishing the Livingstonia mission, and of placing a small steamer on Lake Nyassa, in the interior of Africa; he and his friends being moved thereto by an earnest determination to carry out one of the dearest wishes of the late Dr Livingstone. Mr Young has recently returned home; and on February 26th he delivered, before the Royal Geographical Society, an interesting account of what he did and what he saw on the Lake of Storms, from which we condense the following brief particulars.

We join Mr Young and his party at the Kongoné mouth of the Zambesi, where the sections of the little steamer *Itala* were screwed together; and

although an extraordinary flood, early in 1875, had altered the course of the rivers since her captain's previous visit, nothing materially impeded her passage to the foot of the Shiré cataracts. These falls extend for some seventy-five miles, and are a very formidable obstacle to navigation. In the distance named, the waters of Lake Nyassa leap down a staircase of rocks and boulders for some eighteen hundred feet; and before the traveller can reach the higher ground, he has to traverse a most rugged road. Want of porters, as a rule, is the most grievous obstacle to be overcome; but thanks to the kindly recollection existing among the natives of previous missionaries, Mr Young experienced no difficulty on this score; and in ten days the *Itala* was taken to pieces, and her sections, boilers, machinery, and stores were conveyed to the upper end of the cataracts. What, however, is thus told in a few brief words, involved very great toil; and Mr Young himself says that the carriage of the steel plates, &c., necessitated some of the most tremendous exertion he ever witnessed, which was much aggravated by the intense heat, in some places reaching one hundred and twenty degrees in the shade. We may certainly admit with him, that the men who did this four days' work for six yards of calico each (say one shilling and sixpence), finding their own food too, without a grumble or a growl, were not to be despised. The work of reconstruction was soon accomplished, and steam was up in a fortnight.

The little steamer entered Lake Nyassa at 7 A.M. on the 12th of October 1875. After examining several beautiful bays and inlets, which did not afford the necessary shelter for the vessel, Mr Young's party resolved to settle, at any rate temporarily, at Cape Maclear, whither, accordingly, they transported all their stores. On November 19th Mr Young set off on a voyage round the lake, in the course of which he discovered a large extension of its waters, hitherto unknown. Making his way northwards, he came in sight of the grand range which towers over Chilowela; in places the mountains run sheer down into the lake, and no bottom could be got at one hundred fathoms. After weathering a furious gale which raged for thirteen hours, the *Itala* pursued her northward voyage, passing the islands of Likomo and Chusamoolo. On his right, Mr Young reports an iron-bound coast stretching everywhere, excepting only when some ravine came down to the shore. In one spot, there were evident signs of a dreadful massacre having taken place—the result of a slave-raid. Mr Young's account of what he saw here is curious and interesting. Hardly any wood, he says, was to be procured, in consequence of the forests being cleared, and the only remnant of a large population was now to be found on rocky patches jutting up from the water of the lake, and on singular 'pile villages.' It was found that the poor creatures had conveyed earth in their canoes to these rocks, and wherever a crevice afforded a hold, there would a little patch of cassava or corn appear, grown with infinite labour.

The platform villages reached by Mr Young were exceedingly interesting; for the most part they are built three or four hundred yards from the shore, and in from eight to twelve feet of water. Poles are driven down in rows, and on the top of

them a wooden platform is constructed, forming the foundation or floor of the village. To give some idea of the extent of these, it may be mentioned that one of them consisted of about one hundred huts. With an abundance of fish round them, the islanders hold their own against starvation. Shortly after leaving these strange villages, Mr Young met with some scenery, the description of which is worth quoting. 'We were now abreast,' he says, 'of some mountains that amongst the parallel ranges which virtually make a mountain-basin of Lake Nyassa, exceed them all in stupendous grandeur. In no part of the world have I seen anything to equal their peculiar magnificence. With peaks apparently from ten to twelve thousand feet high, they run perpendicularly down into the lake. The rain was pouring upon them, and numberless waterfalls hung like threads of white floss-silk from crevices which ran out upon their sides far up among the clouds. Baffled by the raids of the Ma Viti in 1866, Livingstone could not induce his men to go with him to the north end of Nyassa, and thus he missed seeing that which would have struck him as the most beautiful feature of "his old home," as he called the lake. There was but one name to give to these mountains. At its northern end they stand like portals to the lake, faced by the opposite mountains; and as future travellers look upon the "Livingstone Range," it may aid them to remember the man who during his life, more than any other, added to our knowledge of the hitherto unknown beauties of the earth.'

A violent storm, more like what might be expected on the Atlantic than on an inland sea, prevented Mr Young from doing much in the way of exploring the unknown region at the end of the lake; but he saw there what he believed to be the mouth of a wide river; and this opinion was confirmed by what he learned from the natives when he next landed after the storm referred to. They averred that a River Rovuma or Rôoma flows out at the extreme north; and he inclines to believe this to be the case for the following reasons: In the first place, Dr Livingstone heard the same story twenty years ago, when he discovered the lake, and in quite a different quarter. It will be remembered by many how sanguine he was that the Rovuma River, which debouches on the east coast, was identical with the Nyassa River, and that it would prove to be a second outlet. It may yet prove to be so; but the discovery can be of little use, for the Rovuma ceases to be navigable a short distance from the coast. The second reason for believing the native report is, that in the stormy time, when Mr Young was there, it was very easy to see where rivers ran into the lake. A long current of muddy water would trail out on the dark-blue surface; in this case, however, there was nothing of the kind; and it is consequently tolerably clear that no inflow exists.

Cruising southwards along the western shore of the lake, Mr Young observed, instead of the iron-bound coast on the opposite side, exquisite park-like glades between the mountains and the water's edge; the herds of game merely looked up as the steamer passed, just as sheep raise their heads to gaze at a train, and then went on browsing. In one place a remarkable detached perpendicular rock stands four thousand feet high. The top is flat, and the sides give it the appearance of a

pyramid from which a large slice of the top has been removed in order to place in position a perfectly square block of a greenish colour. Beneath this singular summit there is a deep horizontal band of white stone or quartz, succeeded by another of clay apparently; and then comes one of intense black, possibly coal, for this mineral is known to all the natives.

Mr Young's story of his cruise furnishes undeniable evidence of the justness of the name Dr Livingstone gave to Nyassa, namely the Lake of Storms, for he has constantly to record meeting with them—one more terrible than the other. The last he mentions must have been fearfully and awfully grand in its wildness. 'At one time,' he says, 'in the middle of a thunder-storm of great fury, no fewer than twelve waterspouts appeared around us, and we had literally to steer hither and thither to avoid them, for had one overtaken us, it would have sent us to the bottom without a doubt.'

Such are the salient features in Mr Young's brief account of the first trip made by a steamer on the stormy bosom of Lake Nyassa. It did not come within the scope of his paper to describe the daily life of the missionary party at Cape Maclear, the insight they got into the native life, the intrigues of the slave-traders, nor the marvellous effect which the presence of Europeans produced on all sides, more especially in attracting to them from the four winds the scattered remnants of villages swept away by slave-raids; but it will be interesting to our readers to state in conclusion, that he hopes to preserve these details for the public in another form, which we feel sure will meet with the welcome it cannot fail to deserve, as the record of the establishment of the first British colony on Lake Nyassa.

CURIOUS PICK-UPS.

THE pick-ups, the findings, from underground or under-sea, or in hidden places above ground, comprise a strange medley of the odd and the choice, appealing to the tastes or the pockets of persons filling widely diverse positions in society.

The drains and sewers, for instance: can a more lowly and uncomfortable treasure-house than these be found? Rat-killing by dogs, in an inclosed space surrounded by the roughest of roughs, is a savage exhibition unfortunately not yet quite died out from amongst us. The exhibitors purchase the live rats at so much per dozen from men who grope along the filthy sewers in search of them; and in Paris especially, dead rats are brought up from the same unseemly regions, and placed in the hands of skimmers and tanners, who manage to get out of them strong and good-looking pieces of leather suitable for the manufacture of gloves. The great changes made in recent years in London by the extensive Main Drainage Works have deprived the sewer-grubbers of much of their chance; but in the old sewers the pick-ups were often strange enough. Dead infants, a dead seal, cats and dogs both alive and dead, spoons, tobacco-boxes, children's playthings, bad half-crowns and shillings, sets of false teeth, washing-bowls, mops, human heads and limbs which had been thus

disposed of by body-snatchers or by anatomical and medical students—all were met with by the sewer-flushers. One party of these strangely employed men came on a certain occasion to a spot where the brickwork between the sewer and a beer-cellar had broken through. What did they do? They helped themselves.

On a former occasion, we presented a few illustrations of the curious operation of the law concerning *Treasure-trove*, the rights and the wrongs of ownership connected with property picked up from the ground or from a small depth below the surface. Among the examples cited was one relating to the finding of treasure near Stanmore in Middlesex, and another connected with the locality of Mountfield in Sussex. Let us present a few jottings of similar pick-ups in more recent years.

A labourer, digging a drain in a farm on the estate of the late Lord Palmerston, found a golden torque or torc, an ancient British necklace. It was ascertained that the original grant of the estate gave to the grantee, as lord of the manor, a right to all treasure-trove found therein; the veteran statesman established his claim, but took care that the finder should not go unrewarded. A ploughman, working near Horndean in Hants, found more than a hundred old silver coins in an earthen jar under the surface of the ground; the lord of the manor gave to the finder the intrinsic value of the coins as mere silver, and then had to fight a battle with the Crown as to who ought to possess the coins themselves. One find near Highgate was very remarkable, on account of the strange manner in which the veritable owner made his appearance. Labourers, grubbing up a tree in a field, found two jars containing nearly four hundred sovereigns; they divided the money amongst themselves, and were then taken aback by the lord of the manor claiming it. Before this claim could be investigated, a tradesman came forward and stated that one night, under a temporary delusion, he had gone out and buried the money; when he awoke, and for some time afterwards, he tried in vain to recollect the locality he had selected, and only obtained a clue when he heard a rumour of the finding of four hundred sovereigns. He was able to bring forward sufficient evidence in support of his singular story; and his claim was admitted.

On different occasions in 1864 the Crown put in claims for treasure-trove—a gold coin found at Long Crendon in Buckinghamshire; sixty-two gold coins found in an earthen jar in a field at Stockerston, Leicestershire; no less than six thousand silver pennies of the time of Henry III. found at Eccles near Manchester; and seven hundred and sixty silver coins earthed up near Newark. The next following year gave the Crown a claim to a hundred and eighty silver coins of the reigns of Mary, Elizabeth, James I., and Charles I., found at Grantham; and to a gold cross and chain brought to light at Castle Bailey, Clare, in Suffolk. The years 1866 and 1867 were

marked, among other instances, by the finding of nearly seven thousand small gold and silver coins at Highbury, near London; eighty guineas concealed in the wall of an old house at East Parley, near Christchurch, Hants; and two hundred and sixty old silver coins in a house at Lichfield. In other years there were nine hundred silver coins found at Cumberford in Staffordshire; and eleven rose nobles found in the cloisters of Westminster Abbey. These several instances of treasure-trove were settled in various ways. Some of the findings were returned by the Crown to the finders; some were sold to the British Museum, in a manner to place an honorarium in the finder's pocket; some were presented to museums, and the money value given to the finders; some are retained by the Crown, as antiquarian curiosities; while one has been handed over to the descendants of a former owner.

Seven or eight years ago two labouring men found a very ancient gold chain, which they sold to a dealer who knew the value better than they did; the unlucky-lucky men fared badly in this instance, seeing that they were punished for selling the 'find' without giving notice to the authorities—rather hard lines for rustics, who are not likely to know much about the law of treasure-trove. In another case a poor man found a pair of ancient Irish silver bracelets; he sold them as old silver to a silversmith, who melted them down at once—to the great regret of an antiquary, who would have given much more than their intrinsic value for such relics of former days. During the multifarious diggings which have been going on for some years in and near Cannon Street and its neighbourhood for the formation of new streets and the construction of large commercial buildings, the workmen lighted upon twenty-nine guineas and twenty shillings nearly two centuries old; the men got into trouble because they did not voluntarily give them up. On one occasion when the fusty and musty contents of a rag-dealer's heap were being overhauled, somewhere in the neighbourhood of Houndsditch, a diamond ring was espied. A contest arose as to who should possess it: a woman engaged in sorting the rags claimed it because she had found it; the rag-dealer disputed her claim; a pawnbroker who said he had advanced money on the ring insisted on his prior right; a dealer in old clothes who had sold a garment for that money, and one or two other persons of somewhat doubtful antecedents—all came forward to shew that, for some reason or other, the diamond ring ought to be considered theirs. Whether the crown waived its claim, we are not certain; but a magistrate eventually gave a decision in favour of the rag-sorter.

Bank-notes, as well as coins, jewellery, and articles in the precious metals, sometimes make their appearance among the findings. A bundle of notes was one day picked up outside the counter of a retail shop: the finder claimed them because he was the finder; while the shopkeeper claimed them because it was on his premises that the notes had been dropped. The real owner, whoever he may have been, did not come forward, and the law decided in favour of the finder. But a much more remarkable case occurred two or

three years ago. A packet containing no less than ten thousand pounds' worth of bank-notes was picked up from the pavement in one of the busy streets near the Bank of England; ten notes of one thousand pounds each. A young City clerk picked up and pocketed the treasure. A friend advised him, on consultation, to keep the notes until the following day, when a handsome reward would possibly be offered by the luckless person who had inadvertently dropped the notes. A firm of solicitors, in the names of the real owners, speedily offered one hundred pounds to the finder. The judicious friend overshot the mark here; he stipulated that he should have nearly half the sum of one hundred pounds as his reward for the advice given; and at the same time coaxed sixty pounds out of the owners by a fabricated story concerning himself, the finder, and the finding. A sheriff court had to decide the matter, and ordered the 'friend' to return part, at anyrate, of the money he had received.

A queer story has lately found its way into the newspapers, not exactly touching on the discovery of treasure, but on a concealment which might possibly lead to discovery if this or that were to occur. One Adolfo de Garcilano (so runs the story), a prisoner in Madrid, and lately a colonel in the Carlist army, was instructed by Don Carlos to take six million pesetas (about one franc each) in English securities and Spanish notes to London, inclosed in an iron box. This treasure he was to bury in the earth in a particular locality, make a sketch of the exact spot, and return to Spain. He was next captured by the Alfonsists, thrust into prison, and told that he would not be set free except on the payment of a large sum of money by way of ransom. Thereupon he wrote to some one in England or Scotland, asking for the transmission of a sufficient sum of money; this done, the secret of the buried treasure would be communicated to the liberal ransomer, who was to retain one-third of it as a grateful reward. If there had been only one such letter, some person might possibly have been victimised; but there were more than one, to different quarters, each requesting the money to be sent to a third party at an address named. We may hereby form a tolerably true estimate of Don Adolfo de Garcilano.

Undoubtedly the most interesting recent discoveries of small but valuable works in the precious metals are those due to Dr Schliemann. Archaeologists have long recognised the probability that buried beneath some of the ancient cities of the world, there are not only architectural and sculptured fragments of much historical importance still remaining to be discovered, but also jewels and other treasures which have not seen the light for decades of centuries. Nineveh, Babylon, Jerusalem, the more ancient parts of Rome, Pompeii, Herculaneum, Egypt, Cyprus, the site of the famous Troy, and those of the once important cities of Asia Minor—all may perchance have something to shew which the present age would be prepared to welcome and appreciate. Concerning Jerusalem, a conjecture has been brought forward of a remarkable kind. After the rebuilding of the second Temple, there were five occasions on which precious metals, treasures, and artistic ornaments might have been concealed by the priests or servitors of the sacred edifice—namely, during the abstraction and sale of the temple

furniture by the apostate high-priest Menelaus; at the plunder and defilement of the Temple by Antiochus Epiphanes; during the plunder by Crassus; during that by Sabinus; and at the total destruction by the Romans. On one or more of these occasions, supposing the Jewish priests and servitors should have placed valuables in the Temple, the place of concealment may not have been made known to others, and the secret may have been carried with the priests to the grave. Various facts have been adduced in support of this surmise, sufficient to whet the curiosity of men who would value such treasures, not for their intrinsic worth as precious metals or precious stones, but for their historical and ecclesiastical connection with momentous events nearly two thousand years ago.

Dr Schliemann, whose name we have just mentioned, when making researches among mounds and heaps of rubbish at or near the supposed site of Troy in Asia Minor, has lighted upon the foundations of cities which he supposes to have been more ancient even than the Iliad.

But the discoveries more immediately connected with our present subject are those which Dr Schliemann has since made in Greece. With the permission of the king he made excavations near Mycenæ, on the site of what is believed to be one of the most ancient cities in that classic land—far more ancient than the renowned Athens. In treasuries and tombs, which had not seen the light for an untold number of centuries, he has disinterred beautifully painted vases, whole or in fragments; terra-cotta statuettes and busts of Juno, horses' heads, lions, rams, elephants; knives and keys of iron and bronze; fragments of lyres, flutes, and crystal vases. But most striking of all is the large quantity of gold vessels and ornaments, undoubtedly of precious metal, and in many instances artistically wrought. Sceptres, bracelets, girdles, necklaces, rings, vases, caps, &c. in plenty. One of the Doctor's greatest triumphs was the unearthing of two vases of solid gold, fourteen centimètres (about six inches) high, richly ornamented. Many of these relics, as well as many inscriptions and bas-reliefs on extremely ancient blocks of masonry, have excited the curiosity of classical archaeologists in a high degree. Their thoughts go back to the epics and dramas which treat of Agamemnon king of Mycenæ; of the expedition to Troy; of Clytemnestra, Electra, Egisthus, Orestes; of the stories of some of the Greek plays by Euripides, Sophocles, and Æschylus. They think of these personages and these events; and they lean strongly to the belief that the disinterred ancient city near Mycenæ, and some of the treasures brought to light by Dr Schliemann, may be veritable tokens of the days of Agamemnon. Some of the articles found were in triangular cells, which he thinks may have been treasuries or depositories for treasure and valuables. But his principal 'finds' of wrought gold were in chambers which were probably the tombs of Agamemnon, Cassandra, and Eurymedon. The vases, the cups, the diadems, the signet rings, were mostly found in these tombs (if tombs they were); as, likewise were the bones of a man and a woman covered with ornaments of pure gold. In short, the discoveries have been of a most unusual, interesting, and valuable kind, well calculated to attract the attention of the learned in Europe, whether

learned in classical history or in artistic archaeology.

Of discovering or recovering of treasures lying beneath the waves of the ocean, we do not intend to treat here. The reader will find some curious notices on the subject in the article already referred to; also in 'Submarine Treasure Ventures' (May 1, 1869); and in 'The Story of La Lutine' (July 8, 1876).

RUSTY IRON.

If no difficulty, as yet unforeseen, bars the way, Mr Barff's plan for rendering iron impenetrable by rust promises to be of the highest practical importance. Iron is by far the most useful of metals, but it has an unfortunate propensity when exposed to water or moist air for attracting oxygen, and this oxygen eats into its substance, and forms the familiar compound known as rust. The consequence is that iron when exposed to the air, especially in so damp a climate as ours, has to be coated with paint, varnish, or tin. But even this coating does not afford entire protection; the slightest flaw in the armour lets in the enemy oxygen, who often does his work all the more surely because concealed from view. A vessel made of iron and coated with some other substance, may look sound to the eye, and yet be a mere mass of crumbling rust. Mr Barff's remedy for this state of things seems to be after the doctrine of the homœopaths, that like is cured by like. If a small degree of moisture affects iron with two distinct species of oxide or rust, what will exposure to a very excessive degree of moisture do? Well, it appears that if iron is placed in a hot chamber and exposed to the action of superheated steam, a new kind of oxide, called the magnetic or black oxide, forms on its surface. Not only does this benevolent species of black rust refuse to penetrate any further into the metal, but it forms an impervious coating against all other influences; and articles thus prepared have been exposed out of doors for weeks this winter without a particle of rust appearing on them. If careful experiments shew that iron is lessened neither in strength nor in durability by this process, its use will be greatly increased, as for several purposes it will take the place of other and more costly metals.—*The Graphic*.

ON A PET DOVE KILLED BY A DOG.

A GAELIC ELEGY.

THE following touching verses (as nearly as possible a literal translation from the Gaelic) appeared in the *Scotsman* of May 17, and were accompanied by a note, which we have abridged, from the translator Mr Alexander Stewart of Nether Lochaber. He says: 'I beg to send you a translation of a Gaelic Elegy by Alastair MacDonald the celebrated Ardnamurchan bard, on a pet dove of his that was killed by a terrier dog. It is, in my judgment, a composition of singular tenderness, pathos, and beauty. Its quaint conceits and abrupt transitions, which the reader cannot fail to notice, though they may seem odd and out of place at first sight, form, in my estimation, no small part of its merit. My translation is about as literal as I could well make it, and I have endeavoured to imitate, with what success let others judge, the manner and measure, the rhyme and rhythm of the original. The pet dove was a female, and at the time of her death had under her care, as the poet fails not to notice with an exquisite touch of tenderness in the fourth line, the dove's usual brood of downy twins.

The reference in the poem to the bird's habitat in a wild state shows that it was of the species known as the blue or rock pigeon, thousands of which inhabit the vast caves and precipitous crags of Ardnamurchan and Moidart.'

Mournful my tale to tell,
Though others heed not my sigh;
My gentle, my beautiful pet dove dead—
Must the callow twins too die?
Alas, for the death of the gentlest dove
That ever in woodland coo'd,
Killed by a dog whose proper foe
Were the otter that fights, and dies so slow
In his cairny solitude.

Of all the birds that cleave the air,
Buoyant on rapid wing,
I mourn thee most, my pet dove fair,
Dear, darling thing!
Noah loved thee, dove, full well,
When a guilty world was drowned;
With thy message of peace thou cam'st to tell
Of solid ground;
He knew thy truth as the waters fell
Slowly around.

The raven and dove good Noah sent
Far over the heaving flood;
The raven wist not the way he went,
Nor back returned, for his strength was spent
In the watery solitude;
But cleaving the air with rapid wing,
The dove returned, and back did bring
His tale of the flood subdued.

At first she found no spot whereon
To rest her from weary flight;
And onward she flew, and on, and on,
Till now at length she gazed upon
The mountain tops in sight;
And the dove returned with her letter—a leaf
(Of mickle meaning, I trow, though brief),
Which Noah read with delight.

Not easy to rob thy nest, thou dove,
By cunning or strength of men;
On a shelf of the beeting crag above
Was thy castle of strength, thy home of love,
Who dare come near thee then?
Harmless and gentle ever wert thou,
Dear, darling dove!
In the ear of thy mate with a coo and a bow
Still whispering love!

Not in silver or gold didst thou delight,
Nor of luxuries ever didst dream;
Pulse and corn was thy sober bite—
Thy drink was the purling stream!
Never, dear dove, didst need to buy
Linen or silk attire;
Nor braided cloth, nor raiment fine
Didst thou require.
Thy coat, dressed neat with thy own sweet bill,
Was of feathers bright green and blue,
And closely fitting, impervious still
To rain or dew!

No creed or paternoster thou
Didst sing or say;
And yet thy soul is in bliss, I trow,
Be't where it may!
That now withouten coffin or shroud
In thy little grave thou dost lie,
Makes me not sad; but oh, I am woe
At the sad death thou didst die.

A 'VILLAGE HOME'

INDUSTRIAL schools, in which poor children, the waifs of the streets, are fed, lodged, and taught some useful employment, have been in existence for more than thirty years, and are on all hands acknowledged to have been successful as a means of preventing—or lessening the amount of—juvenile crime and vagrancy. The weak point in the organisation of these schools is that they rely for support on the voluntary contributions of benevolent individuals, instead of forming part of the poor-law system, and being thereby maintained by the whole taxable community. Some will think there is a more serious drawback in their constitution. By whatever name these schools are known, they are in effect asylums for the grouping of children to the number of several hundreds in a large establishment; and so far are a repetition of the old species of hospitals, which are now generally condemned. On a late occasion we brought under the notice of our readers a method of boarding-out pauper children among the families of rural labourers and small tradesmen in country towns, which has proved eminently successful wherever it has been tried in Scotland. As this method of boarding-out is under the administration of parochial boards relying on rates, it has, with other merits, that of not specially taxing the benevolence of particular individuals.

What we peculiarly admired in the boarding-out system was its conservation of the family-home as a means of juvenile nurture and intellectual and moral culture. We now propose to give some account of a family-home system which has been established in England. It differs materially from that prevalent in Scotland, and further labours under the objection of being a voluntary charity similar to that of the Industrial schools. Though not quite to our mind, it is much better than nothing, and we bespeak for it the kindly attention of the public.

This English 'Village Home' system originated in the efforts of Dr Bernardo, who began with a

'Home' for Arab and gutter boys in London. No sooner was this Home in operation than he set about founding a similar establishment for girls, in which good work he was ably assisted by his wife. 'The Village Home' at Ilford in Essex, for orphan, neglected, and destitute girls is the result.

Little girls up to the age of eleven or twelve are rescued weekly from misery and danger and placed under the care of a Mother. Even babies of only twelve and fifteen months are admitted, in cases where the detective, employed by Dr Bernardo to find out wretched and abandoned children, learns that the child will be brought up by a 'tramp' to a life of infamy. Before a girl thus rescued is permitted to join the family of which she is to become a member, she is carefully tended for several weeks in a Home in London, in order that her freedom from disease and her personal cleanliness may be secure; after which she is sent down to Ilford, and becomes at once a member of a *family*, with a dozen other girls of varying ages for playmates and sisters. The Mother gives her a kiss, and tells her to be a good girl, and they will all love her dearly; and in a few days the forlorn little one is transformed into something human and child-like. In order to become acquainted with the internal organisation of this 'Home' training of large numbers of destitute children gathered together from all parts of London, we recently visited Dr Bernardo's 'Village Home' at Ilford, the third and most recently founded establishment of the kind. Thither we repair, and find that the pretty red cottages which compose the Village form an oblong square, which surrounds a large open space of ground, intended hereafter to inclose a piece of grass of sufficient size for the grazing of a few sheep. A picturesque gateway admits the visitor to the governor's house, which is built in the same style as the cottages. We were met at the entrance by the governor.

'The children are all in school now,' said he; 'what do you say to going there first, and then you will see them all together?'

During a walk of some five or six minutes, past a dozen cottages and through two or three turnstile gates, we met on our road half-a-dozen happy-faced little children minding babies younger than themselves. The school-rooms occupy a long detached building. We entered one, a large cheerful room furnished with desks and forms, and hung with maps, pictures of animals, and illustrated texts of Scripture and homely proverbs.

The girls regarded us with bright cheerful curiosity. There was no stolid indifference or sullen discontent expressed in any of their faces. They stood up as the governor took off his hat, and each one dropped us a quick little courtesy and smiled pleasantly as we passed by her desk. The ages of the children in this room varied from perhaps ten to fourteen or fifteen; and we observed that their hair was not cropped, that it was braided close to the head, according to the fancy of the owner, where it was long; and that those who had it short wore either a round comb or piece of dark ribbon to keep it from falling over their eyes.

On our remarking to the governor that this in itself was a great improvement on the usual habit of keeping the hair cropped, he replied: 'We do all we can to develop nice womanly habits in the older girls, so we make it a rule *never* to cut their hair, so long as they keep it clean and tidy; and we find the plan succeeds very well, each girl knowing the penalty she will have to pay for slovenliness in this respect; and as you see for yourself, they take care to keep their locks.' The girls are not dressed in uniform, which we consider to be advantageous.

A pleasant-faced schoolmistress presided over this room. The hours perhaps are a little longer than is absolutely necessary; but still, although morning lessons were just over, we searched in vain for one over-tired listless face. All the children looked happy and bright and clean, and most of them were so healthy in appearance that it was a real pleasure to watch them eagerly putting away their slates preparatory to scampering back to their various homes.

The school-room education is sound and practical, and suited to the position the girls will occupy on leaving the Village.

An animated scene met our view as we turned into the square around which stand the various Homes. About a hundred girls, from fourteen years old down to babies only just able to toddle, were laughing and chatting merrily as they hurried along the broad pathway, and gathered in clusters in front of each cottage, glancing shyly at the visitors walking behind ere they disappeared indoors like bees returning to their hives.

We entered the first Home; and as they are all alike in form and arrangement, a description of one will suffice for all. They are of red brick, detached, and of Gothic style, containing day-room, kitchen, scullery, and pantry on the ground-floor, besides a tiny private sitting-room for the Mother. The sleeping apartments are up-stairs, five in

number; four for the little family, and one small one for the Mother.

From half-past twelve to one is dinner-hour, so we arrived just in time to see the meal served. Each cottage is presided over by a woman carefully selected for the post she has to fill, capable of both firmness and gentleness, of an affectionate disposition, and accustomed to manage children. She is called Mother by the little ones under her care; her will is law; all in her cottage obey it; or if not, are treated as naughty children would be in homes of their own. The various arrangements of the household are made clear to each inmate, and the conscientious carrying out of them is inculcated on each member of the family for the comfort and well-being of all. The cottages are large enough to hold twenty girls, five in each bedroom; but when we were there, none of the cottages contained more than fifteen or sixteen.

The rooms in which the girls sleep are plain and homelike. Small iron bedsteads painted green, and covered with a counterpane bearing the name of the Village, woven in the centre, occupy the corners; a washing-stand with basin and jug and soap-dish of simple ware, is placed on one side, to enable the girls to learn to use and lift such breakable articles without fear or awkwardness; combs and brushes are kept in a drawer, and a square looking-glass hangs on the wall, that there may not be any excuse for untidy appearance.

Nothing is done in the Home by forced routine. The older girls take it in turn to help to cook the dinner, to lay the cloth, to keep the house in order, and to imitate Mother in everything she does. Each small domestic duty is performed over and over again, till each child learns to be quite an adept at cooking potatoes, or cleaning out a room, or washing and dressing a younger one; and takes a pride in her work, so as to be able to do it *as well as Mother*. The child is daily and hourly accustomed to perform small services for the household, to keep down her temper, to give sympathy and willing aid to those who have not been so long in the Home as herself, and to do all she can to help Mother; hence, when she enters service, she has already learnt in her Home to do thoroughly all the commonplace duties which are likely to fall to her lot as a servant. In these Homes every girl has a motive for which to work; she is taught to love truth, to be gentle and modest, and to give and accept the affection to which all have an equal right from Mother down to the youngest in the house. Family interest is encouraged in every cottage; the girls are taught to regard each other as adopted sisters; individuality of character is carefully studied by the head of the household, and as far as lies in her power, is trained into usefulness for the benefit of the whole community.

Every day, in each household one or two stay from school for an hour or so, in order to learn the art of cooking the simple dinner partaken by their sisters when they come home. The table is carefully laid; every article in the kitchen is

scrupulously cleaned; the rice, if it be rice-day, duly weighed, washed, boiled, and constantly watched by the eager pair of eyes whose duty it is to see that it does not burn; and then, when all, with clean hands and faces, are seated round the table, the little cook of the day has to carry the plates full of rice to Mother, to add the treacle or sugar allowed, according to the wish of each child.

The furniture of the cottage throughout is solid and plain, and of a kind that can be kept clean by scrubbing. The children amuse themselves in the room in which they dine; at one end of which are shelves divided into pigeon-holes, in which each girl may keep her work and small treasures. These pigeon-holes are left unclosed, to teach the children to resist the temptation of touching a sister's things without leave. In this room they play, work, mend their clothes, darn their stockings, and talk to Mother, who sits with them for the greater part of the evening. She has her own private parlour at the side, from whence she can command a view of the kitchen and scullery and see that all goes on well there; and at the same time she can hear, without being seen, the conversation that takes place between her children and any relative who is permitted to visit them; an arrangement which often avoids harm from injudicious influence.

One of the special duties of the Mother is to inculcate habits of domestic comfort in a home on a small scale, and so to cultivate the powers of contrivance of each girl as to obtain the greatest possible amount of household pleasure for all.

Each girl's clothes are kept on a shelf in a press; the elder ones superintending mending operations, and the tidiness of the younger ones. There is *no number* marked on their things, not even on the shoes and boots, which are kept beautifully clean and ready for use in a recess at the foot of the press.

Everything about the cottage bears the stamp of ordinary home-life; nothing is institutionised. Every natural social feeling is fostered and developed in this Home life, so that when the time arrives for a girl to go into service, she carries with her into her new home not only a practical knowledge of the duties expected of her, which fits her to hold her own among her fellow-servants, but the firm conviction that she has only to do well to get on; added to which she wears in her heart the very best preservative against doing badly, the talisman of the love and affection of the family amongst whom she has been reared.

Each cottage is called at Ilford after the name of a flower—Hawthorn, Rose, Forget-me-not, Sweetbrier, and so on; and as far as possible the hats and cloaks for Sunday and holiday-wear are identified, each with its Home; so that the groups belonging to the various Cottages may be distinguished in church by the differing colour of the hat or style of the cape.

A large laundry is attached to the cottages. Here the girls learn laundry-work, from the clean washing and ironing of a coarse towel to the careful golfing and ironing of a lady's ruffle or a gentleman's shirt. They all take their turn in every department of the work, not doing a set piece and then leaving it because the task is done, but taking an interest in the part assigned to them, and each one vying with the other in quickness

and thoroughness. The pride with which they exhibited their ironing shewed plainly that it was no forced task, but a labour of genuine pleasure. Bright pleasant-spoken women superintend this part of the Home, inculcating that 'everything that is worth doing at all is worth doing well,' and seeing that nothing is left till it is finished. Although it was the dinner-hour, several of the girls were still busy at the tables.

'It won't take you five minutes to finish that shirt, Lucy,' we heard one of the women say to a rosy-cheeked girl; 'and it would be a pity to leave it; the starch will get so dry.' The girl answered with a smile, and went on ironing cheerfully, quite as anxious that her work should look nice as the Mother was for her. Such training as this cannot fail in its desired effect; and girls taught thus early to take an interest in the labour of their hands, cannot fail to do honour to the Home they have been reared in, and the kind Mother, whose affections they hope to retain to the end of life.

A girl who had been thus trained for two or three years waited on us at lunch at the governor's table. She is about thirteen, and not very big for her age; but she managed not only to supply us with all we required in a handy way, but to carry up to the nursery the babies' dinner. Her movements were quiet, her manners dignified and self-contained, and she kept an eager watch on us, to observe if we had all we needed. She was evidently intent on doing her best, and was ambitious enough to even try and divine if anything was missing. We were informed when this girl left the room that she had been in the Home some time, that she had a fearful temper, but that great hopes were entertained of her turning out at sixteen a good useful servant.

We were all the more impressed with this specimen of the results of the Home training system, as we had only a short while since had in our house a pattern girl from one of the workhouse schools. She was sent to us as *quite* fit to enter service. She was fourteen, a year older than the Ilford little maid, and had been brought up from a baby in the Union. She could read and write perhaps better than most young ladies of her age; she knew a smattering of geography, a jumble of history and poetry, but such an amount of bad language and viciousness that we were horrified at her knowledge. Not one simple piece of household work did she know anything about or cared to learn to do. She was stolid and indifferent if shewn how to clean, insolent if reproved for a fault, and not to be trusted either in what she said or in what she did. She had no standard of morals; stared absently, as if one were addressing her in an unknown tongue, if spoken to about trying to do her best to please her mistress; and when waiting at table or performing personal service, merely acted like a machine; and yet she was naturally a much cleverer girl than the Ilford child; and if she had been subjected to the refining and humanising effects of Home surroundings, might have developed into a thoroughly useful maid.

Dr Bernardo entreats all who can to join him in carrying on the work he has begun of rescuing vagrant girls from destruction. Like many institutions dependent on precarious contributions, it is sadly in need of funds, and will gratefully receive presents either in linen, simple stuffs for girls' frocks, or in money; and we can answer for it, that

all those who are interested in the Home and would like to see it, will be kindly greeted by the governor if they will take the trouble to visit the pretty little Village at Ilford.

THE LAST OF THE HADDONS.

CHAPTER XXXII.—BENT, BUT NOT BROKEN.

AN hour later I slipped noiselessly in at the cottage door, which stood hospitably open for me, passed the parlour, where I could hear Mrs Tipper and Lilian talking together, and stole up to my own room. Gusts of wind and rain were beating in at the open window. I afterwards heard that a terrible storm had swept over the country that night, laying waste the crops and spoiling the harvest in all directions; I only knew of the storm which had devastated my hopes. I imagined that I had myself sufficiently under control to venture to return—but alas! Another bitter struggle, another wrestle with my weaker self, amidst wild prayers for help—for death.

Then I was on my feet again, telling myself, in a pitiable would-be jaunty strain: 'No; you will never slip out of your misery in *that* way, Mary Haddon, and it is folly to hope it. You are not the kind of person, you know. You could not die of a broken heart if you were to try. Your vocation may be to suffer, but you will not die under it—certainly not without a long preliminary struggle to live. You are not made of the material which fades gracefully away under pressure; and yesterday you would have affirmed that you did not wish to be made of it. You have always scouted the idea of being at the mercy of circumstances; you have been a little hard upon those who succumbed under trial—in your inmost heart, you know that you have not had much patience with weakness; and now has come the opportunity for proving your superiority to ordinary mortals.'

Then my mood changed. I dragged myself towards the dressing-glass, thrust the damp hair from my brow, and stared at my face with miserable mocking eyes, as I reviled it for its want of loveliness, and taunted myself with not being able to keep a good man's love. Then I fell to weeping and pleading again; and thank God, it was *this* time for help to *live*. Alas, would the victory *ever* come? Do others find as much difficulty as I did in overcoming? Have others as much cause to feel humble in the hour of victory as I had? I know that it is all very pitiful to look back upon; though the consciousness of my weakness under trial did me great service afterwards. Weak and faint, but thank God, not worsted, I at length rose from my knees, bathed my face and hands, and after a while had my feelings sufficiently under control to think over the best way of doing what it was my resolute purpose to do. My power of self-command was *very* soon put to the test. I was conscious of another sound besides that of the sighing and sobbing of the wind, which like a tired child who has spent its passion, was sinking to rest again. Some one was tapping rather loudly at the door.

Alas! how weak I still was. How could I meet Lilian's eyes? Not yet, I dared not. But whilst I stood with my hands pressed against my throbbing heart gazing at the door, I recognised Becky's

voice. What a reprieve! I hastened to admit her, and then locked the door again.

'If you please, Miss, Mrs Tipper was afraid you was out in all this storm, and'—She stopped; looked at me for a moment with dilating eyes, and then her tears began to flow. 'O Miss Haddon, dear, are you ill? What's the matter?'

'You must not cry, and you must not speak so loud, Becky.'

She saw that I waited until she had ceased, and hastily rubbed the tears out of her eyes.

Then in a low quiet voice, I said: 'A great trial has to be gone through, Becky. It *must* be borne, and I think you can help me to bear it.'

'I knowed it was coming—I knowed it!' said Becky, under her breath.

'What did you know was coming?'

She appeared for a moment to be searching in her mind for the best way of telling me, and at the same time expressing her sympathy; then with lowered eyes replied: 'I loved Tom—I always shall love him—and he can't love me.'

She knew then! Probably every one but myself had seen it!

'In that case, you know that such things are not to be talked about, Becky.'

'Yes, Miss; only'—

'I know that it was your regard for me which made you mention it. But we need all our strength just now—you as well as I—and we must not think or speak of anything that will weaken it. I want your help, and to help me you must be cool and quiet and strong. Will you try to be that?'

'Yes; I will—I will indeed, dear Miss Haddon;' eagerly adding: 'What can I do?'

I stood pressing my two hands upon my temples in anxious thought a few moments, then asked: 'Do I look unlike my usual self, Becky—ill? Tell me exactly how I look to you?' thinking of the effect which the first sight of me had had upon her!

'Yes; you look terrible white, and wild, and trembling; and there's great black rims round your eyes,' gravely and straightforwardly replied Becky.

'As though I had been frightened by the storm. There has been a storm; hasn't there?'

'Yes; there's been a terrible storm, Miss; but'—

'Go on, Becky.'

'You're not the sort to look like that about a storm.'

'I see.'

If that was Becky's opinion, 'the storm would not do for Lilian and Mrs Tipper, and the alteration in my appearance must be accounted for in some other way. I was seeking about in my mind for a way out of the difficulty, when Becky unconsciously helped me with the exclamation:

'O Miss Haddon, dear, what have you done to your hand?'

Looking down, I saw that there was a slight wound in it—made I suppose when I fell, by a nail or sharp stone—and that it had been bleeding somewhat freely.

'Nothing to hurt, Becky,' I murmured; 'but it will serve my purpose. Give me a handkerchief—quick! and now another!'

She understood me; and when Lilian presently came running up, she found appearances suffi-

ciently sanguinary—quite enough so, to account for my looking strange and unlike my usual self.

'Dear Mary, what is it? Oh, how have you hurt yourself?'

It was really a very superficial wound; but of course I did not explain that; making a little demonstration about the wrapping up with Becky's assistance.

'It has made you look quite ill, dear!' went on Lilian, kneeling down by my side. 'Let me tie that, Becky.'

But Becky would not yield an inch until I had given her a little look of reminder, and then did so very reluctantly.

'And your clothes are quite wet, darling!' ejaculated Lilian. 'You must have been out in all that storm. Fearful, wasn't it? Could not you find any shelter?'

'No; it had to be borne as best it might,' I grimly replied; though I called myself to order at once; a startled look in Lilian's eyes shewing me that I could not talk about storms with impunity as yet.

Then there was dear little Mrs Tipper hurrying in with a concerned face to inquire what had happened, and recommending all sorts of remedies for my hand. Did I not think it better to send Becky into the village for Mr Stone the surgeon? Was I quite sure it did not require being strapped up? Had I looked to see if there was anything in the wound? &c.

But I had my hand well muffled up; and assured them, with more truth than they suspected, that it really was not a very serious cut. 'Only I think I will say good-night, and take off these wet things at once, if you will excuse my not coming down again,' I added, with a feverish longing to be alone.

I had nevertheless to submit to mulled wine and a great deal of comforting and petting. And Lilian entreated to be allowed to remain with me during the night. 'Dear Mary, do let me stay; I feel sure that you are not so well as you think you are.'

But I sent her off with a jest; and my first difficulty was overcome. Two hours later, when she had made sure that the others were at rest, Becky stole into my room.

'I will lie on the floor, and I won't speak a word; but don't send me away, please don't send me away,' she whispered.

I was obliged to make the faithful girl share my bed, for I could not prevail upon her to leave me. Probably her presence was some little help to me in the way of preventing any indulgence of sentiment, had I been inclined to yield to it again. When morning came, cool and fresh and sunny after the storm, I was myself again; not my looks—the effects of the storm which had passed over me were not to be so easily effaced—but I was nerved in spirit for what was to come. In the early morning—so early that Becky had barely time to slip away—came Lilian in her white wrapper; and then I noticed how fragile she had become. My darling, had I been even for a moment so unjust as to doubt you, I could have doubted you no longer! She was full of loving sympathy about my hand.

'Dear Mary, I could not sleep for thinking of you. Even now you do not look quite yourself.'

'Nevertheless, I am myself.'

She nestled closer to me, looking anxiously and doubtfully up into my face. How thankful I should have been just at that moment if love were as blind as it is sometimes depicted as being!

'No; not quite your old self. Say—do say that you love me, Mary.'

'Is it necessary to say it, Lilian?'

'Yes; feverishly.'

'Then I love you, child.'

'And—and say that you believe my love for you is true—say it!'

'I know that your love for me is true, my sister.'

Once more she clung to me trembling in her deep emotion; but silently this time, and believing that she was asking for strength to go on, I waited until she was able to do so. Although I knew now that she loved Philip—it was as plain to me as that he loved her—I thought it better to let her herself lead up to what she wanted to say. It would comfort her by-and-by to remember she had been able to say it. Presently she looked up into my face, a holy light in the sweet eyes as they steadily met mine.

'Mary, you have not told me when your wedding is to take place. Recollect, you must give me at least a week's notice for my dress. I do not choose you to have a shabby bride's-maid. No, indeed; I mean every one to see that—she loves you. Is the time fixed?'

'Philip wished me to decide last night, and—something was said about next week, dearie.'

'I am glad it is settled, Mary;' with grave earnestness, her eyes still fixed upon mine.

'But—I am afraid it will shock you very much to hear it—some way, I do not care to think about it.'

She grew whiter, clinging closer to me as she echoed: 'Not care to think about it!—your marriage?'

I steadied myself. One weak word—a look—and all would be in vain.

'It does seem a little strange even to myself. But to confess the truth' (I could hardly keep back a bitter smile at the thought of the truth helping me so), 'I had scarcely promised Philip an hour, before I began to think I would put it off.'

'Why?' she murmured—'why?'

'It is so difficult to explain the workings of one's own mind. I am not sure whether marriage is my vocation. I begin almost to fancy that I must have been intended for an old maid. Would it shock you very much if I were to be one after all?'

'You!—an old maid! How could that be? You are jesting of course.'

'I am not so sure.—But run away and dress, child. If we are late for breakfast, auntie will fancy that all sorts of dreadful things have happened to us.'

She obeyed me, but was, I saw, puzzled, and even a little frightened at my jesting. The only effect of my first attempt had been to make her startled and afraid. Her knowledge of me had not taught her to expect that I should not know my own mind upon so momentous a question as my marriage. My task would be difficult indeed. At breakfast she told Mrs Tipper that my marriage was to take place the following week.

'Next week, dear?' said the thoughtful little

lady, looking from one to the other of us in a nervous startled way, adding rather confusedly: 'I did not expect—that is, I thought there would be more time for—preparations, you know.'

'I believe it is all Mary's fault; and that she gave us so short a notice on purpose to escape a fuss, as she calls it, auntie. But she will not escape any the more for that, will she? A great deal may be done in a week.'

'Of course we shall do the very best we can do in the time, dear,' returned the little lady, looking the least self-possessed of the three of us, as she went on to ask me in a trembling voice which day in the week was fixed upon.

I said something about its not being decided yet, and tried to force the conversation into other channels. But Lilian would talk about nothing but the wedding and the preparations to be made for it. Her forced gaiety might have deceived me, had I not known.

'You will not require to buy much, auntie; the gray moire and white lace shawl, which you only wore once at the Warmans' *fête*, will do beautifully with a new bonnet. But I of course must be new from head to foot—white and blue—I suppose. The best plan will be to write to Miss Jefferies and give her a *carte blanche* to send everything that is right; for we do not mind a little extra expense for such an occasion; do we, auntie?'

'No, dear, no; of course not. But you have not asked what Mary has chosen.'

'Oh, that will be white of course.—When is your dress coming down, Mary? I must see that it is becomingly made; you know you are so careless about such matters.'

I made some remark to the effect that wedding dresses and wedding paraphernalia in general did not sufficiently interest me to seem worth the time and trouble they cost.

But Lilian was not to be repressed, returning again and again to the one topic.

'And you must not forget that you promised to let auntie and me take the management of Lill Side during your absence, and see that all your plans are being properly carried out. Nancy is to go there at once, I suppose! Philip says that the oak furniture for the library will not be ready for a couple of months, on account of the firm having so many orders for the pattern you chose. And, recollect, Mary, I am to have the pleasure of choosing *everything* for your own little cosy; I know your taste so well that I am sure I shall please you, and you are not to see it until it is finished.'

All I could do was to try to give them the impression, without saying so much in words, that I was not so much interested in the question as might have been expected. I saw that it would not do to venture far, with Mrs Tipper's eyes turned so watchfully and anxiously upon me.

My hardest trial was the unexpected arrival of Philip soon after breakfast was over. Whether he had come down only to fetch the papers, or whether it was in consequence of what had passed between himself and Robert Wentworth, I know not, but he availed himself of the opportunity to tell Mrs Tipper that I had consented that our marriage should take place the following week.

At his first words I took the precaution of seating myself at the piano with my back towards

them, running the fingers of my one hand over the notes, with a demonstration of trying the air of a new song which he had added to our collection. Then with my fingers on the keys, I stopped a moment—quite naturally, I flattered myself—to throw him a few words over my shoulder.

'The idea of your taking my words so literally as all that!'

'I not only took your words literally, but mean to make you keep them literally.'

'Oh, nonsense!'

Ah Philip, how surprised you were, as indeed you well might be, at my assumption of flightiness! How more than surprised you were afterwards, when I placed every obstacle I could think of in the way to prevent our being alone together; and how honestly you tried to act the part of a lover in the presence of Mrs Tipper and Lilian, insisting upon my keeping my word, and refusing to accept any excuses for delay, Lilian as honestly taking your side.

Fortunately, my maimed hand, which I kept in a sling and made the most of, sufficed to account for my altered appearance. But for that and my bearing towards Lilian, Philip might have suspected. Then he found me so entirely free from anything like pique or anger towards himself, that he could not imagine the change he observed to be occasioned by any fault of his own. I had indeed nothing to dissemble in the way of anger. In my moments of deepest misery, it was given me to see that there had been no intended disloyalty to me. Philip's love for Lilian and her love for him were simply the natural consequence of two so well fitted for each other being thrown together intimately as they had been. I am writing from a distance of time, and of course in a calmer frame of mind than I was in at the moment of the trial; but I know that my thoughts all tended to exonerate them from the first.

None knew better than did I how completely free Lilian was from anything in the way of trying to attract, even as much as girls may honestly do. Knowing what I did—reading both their hearts—it was very precious to me to see their truth and fealty to the right. I knew that if they once perceived my suffering, nothing would induce them to accept happiness that way. I *must* keep my nerves steady! As much as I was able to compass that first day was to puzzle them all; but even that was a little step—it was something that they could see the change without discovering the cause. Quite enough to begin with.

TORPEDOES AND INFERNAL MACHINES.

ON Easter Monday last, when several thousands of persons were holiday-making in a public garden out north-westward of London, a loud bang startled the inmates of houses many miles from the spot in all directions—louder than any discharge of artillery, and comparable to a blowing-up on a tremendous scale. It proved on investigation to be due to the explosion of a cylinder no more than twenty-five inches in length by two inches in diameter, filled with one or other of those destructive compositions which chemistry has lately presented to us, and to which have been given the mysterious names of dynamite, lithofracteur, gun-cotton, nitro-glycerine, &c. How such a diabolical sausage got into such a place at such a time, and

what the police authorities have had to say about it, we need not detail here; but the subject sets people thinking ugly thoughts about Torpedoes and Infernal Machines.

The French have had much to do with (so-called) infernal machines, which, under various forms, have been employed to assassinate successive sovereigns, but happily failed in the wicked attempt, though not without inflicting injuries on onlookers. In 1804, when Napoleon thought that he had England pretty nearly in his grasp, a *catamaran* expedition was fitted out by the English to act against him. This catamaran was an oblong water-proof box lined with lead; it contained fifteen hundred pounds of gunpowder, various inflammable substances, clockwork to produce an explosion at a given moment, and ballast to steady it. Being towed towards an enemy's ship and left for the tide to float it onward, it would cling to the ship by means of grappling-irons buoyed up with cork; and in a given number of minutes the clockwork acting on a trigger would explode the combustibles. Such at least was the theory; but the chances of failure were found to be too numerous and varied in practice. Some years after this, Colonel Colt, the inventor of the celebrated revolver, devoted a great deal of time to this subject of infernal machines, making many combinations which were useful as hints to later contrivers.

In 1809, when Lord Cochrane was engaged against the French in the Bay of Biscay, he employed a destroyer most formidable in character. He filled a number of empty puncheons with about fifty thousand pounds of powder; on the tops of these puncheons were placed three hundred and fifty explosive shells, with fuses, and upwards of two thousand hand grenades among and between them. The whole were bound and jammed together with cables, wedges, and sand, on board a small vessel called the *Derastator*. A fifteen minutes' time-fuse being ignited, the crew (Cochrane himself, a lieutenant, and four seamen) rowed away quickly in a boat. The infernal monster did not produce quite the kind of mischief intended; the explosion was one of the most tremendous ever heard; but the enemy's ships were rather too far away to be materially damaged, while Cochrane lost some of his gallant little crew by over-fatigue and drowning by tumultuous waves.

During the short war between England and the United States in 1812-13, many submarine boats were suggested and partially tried, but with no great result.

The Crimean War (1854-56) brought to the Admiralty a deluge of inventors and projectors, each armed with some new scheme of a 'diabolical' kind. The Earl of Dundonald (the Lord Cochrane of 1809) sounded the government concerning a plan which he had matured long before; but there was hesitation in the matter; and the public learned little more than that the scheme related to a kind of fire-ship. Captain Warner's 'long range' was another crotchet, by which an enemy's vessel was to be destroyed at an immense distance by *something* being hurled against it; this something, whatever it may have been, did not find favour with the government. Then there was a talk also about Captain Disney's war-projectile, consisting of a metal cylinder having a bursting charge at one end, and at the other a

highly combustible liquid; the liquid, when exposed to the air, set fire to almost everything with which it came in contact. This pleasant kind of plaything was to be propelled against ships, buildings, or masses of troops. Captain Disney had another mode of employing what he frankly called his 'infernal fluid,' which would 'cause blindness for several hours to all troops coming within a quarter of a mile of it.' The real nature of the liquid was his peculiar secret, which, so far as we are aware, the government did not think proper to purchase.

While discoverers and inventors were directing their attention to these intentionally destructive contrivances, the principal governments were cautiously testing some of them as opportunity offered. The Russians studded the Baltic with submerged torpedoes in 1854-55; iron cases containing combustibles, sulphuric acid, and chlorate of potash, so placed that a sudden concussion would make the whole explode. Very few British ships were really hit by them; but a good deal of uneasiness was felt by the crews of Admiral Sir Charles Napier's fleet, who would much rather have encountered an open enemy than a concealed submarine foe, the whereabouts of which could not be determined beforehand. In 1866 the Austrians in their brief war with Italy used torpedoes in which gun-cotton was fired off by an electric current. During the American Civil War, 1861 to 1865, nearly forty vessels were destroyed by torpedoes. (We may here mention that this name, first given to these contrivances by the Americans, was derived from one designation of the torpedo or electrical fish.) Three-fourths of the destruction was wrought by the Confederates against Federal vessels, but the remainder blew up or disabled the Confederates' own ships. The torpedoes employed were of various kinds and sizes, some exploding by mechanical concussion, some by chemical action, some by electric discharge. One of them was a complete submarine boat, which could be lowered to several feet below the surface of the water, and there propelled with hand-paddles at the rate of four miles an hour, by men shut up in a water-tight compartment, and provided with half an hour's compressed fresh air. This submarine boat dragged a floating torpedo, allowed it to come under the bottom of an enemy's ship, paddled away to a safe distance, and then fired the torpedo by an electric fuse. Such at least was the theory; but it proved to be a case of the engineer 'hoist by his own petard;' for although the torpedo really did destroy a Federal ship, the submarine boat and its crew were never afterwards seen or heard of.*

Some of the contrivances to which naval engineers are directing their attention are called *outrigger torpedoes*. A small swift steamer has an outrigger or pole projecting twenty or twenty-five feet from one side; a torpedo case is fastened to the outer end of the pole, and a concussion-fuse is fitted to it, or an electric-wire extends along the pole. When the steamer has cautiously and

* Since writing the above, information has come to hand concerning the real fate of this submarine craft. When the civil war was over, divers were sent down; they fished up the enemy-destroying and self-destroying torpedo-boat, which was found, with its dead crew in it, underneath a Federal ship, which it had sunk by bursting a hole in the hull.

silently brought the torpedo (which may be either a little above or a little below the surface of the water) under the bottom of an enemy's ship, the composition within it is fired by the fuse or current, and the explosion left to do its destructive work. It is supposed and intended that the distance of twenty or twenty-five feet between the steamer and the torpedo will keep the former free from peril. Some torpedoes are self-explosive on touching the enemy's ship. One variety is a hollow iron cone, kept at a certain depth under water by a mooring chain; the cone contains from one to three hundred pounds of powder; above this is an air-space to give buoyancy, over this a small apparatus of chemicals, and at the top of all a projecting rod. If the bottom or lower part of the hull of a passing ship happens to strike against this rod, a kind of trigger explodes the chemicals and then the powder—with what result the evil fates are left to determine. Another kind, not self-explosive, is ignited from the shore. The torpedo-cone is moored as in the former case, and electric wires extend from it to a battery on shore. When an enemy's ship is seen to be passing just over the torpedo, a shock is sent from shore, and the demon of mischief explodes. A self-exploding torpedo has the disadvantage of destroying one's own ships occasionally, by a mishap; while the others are with difficulty coaxed to explode just at the desired instant.

Six or eight years ago, the public were a good deal mystified about Captain Harvey's torpedo, what it was and what it was intended to accomplish. It was described as an oblong box, to be towed beside a steamer by means of a long rope. It was charged with a powerful explosive composition; it had projecting levers at the top, a tube containing a detonating compound, and a bolt that could be pressed down upon the detonator by the levers. Towed out to its place by a steamer of great speed, it is brought close to the side of a hostile ship, the tow-rope is then slightly slackened, the torpedo sinks a little, and as the rope tightens again, it comes with a violent blow against the ship's bottom, exploding and making (theoretically at anyrate) a big hole in the ship's hull: a short process, but by no means a merry one. (The English authorities are said to be manufacturing Harvey's torpedoes at Woolwich Arsenal at the time we write, June 1877.)

Rather more recently, Captain Ericsson's torpedo attracted the attention of the American government. It had one feature of a remarkable character—a hempen cable utilised as a tube or pipe by making the centre hollow. The torpedo, a cylinder of light galvanised iron, was about ten feet long by nineteen inches in diameter, and was charged with nearly four hundred pounds of nitro-glycerine. It was towed by a steamer, with a tubular cable or rope half a mile long. When brought into a desired position, the torpedo was propelled swiftly in any direction by compressed air driven through the tubular rope. The torpedo could be wound in so as to be any less distance than half a mile from the steamer. One rather fails, however, to see how the commander of the steamer is to send the explosive matter against an enemy's ship exactly at the right time and in the right direction.

The Whitehead or fish torpedo, one of the kinds now being experimented upon by the Eng-

lish government, appears to be a very elaborate contrivance. It is a sort of submarine rocket, a cigar-shaped iron case five or six yards long by about half a yard in diameter at the thickest part. At one end is a charge of three or four hundred pounds of dynamite or of compressed gun-cotton, with a pistol or trigger-detonator to ignite it; then a pneumatic chamber for compressed air, with an apparatus for maintaining the torpedo at any predetermined depth below the surface of the water; then an air-chamber, tested to a thousand pounds on the square inch, and containing an air-engine with compressed air; and lastly, a double action screw propeller. So much for the torpedo; but how to make it travel along and then explode? It is either driven into the sea out of an apparatus called an ejector, fitted in the bow of a steamer built for the purpose, or it can be launched from a special carriage placed on deck. The arrangements can be so made that the torpedo will travel along at any depth below the water varying from one foot to thirty feet, for a horizontal distance of a thousand yards, and with a speed of seven miles an hour. A torpedo-vessel called the *Lightning* has just been built by Messrs Thornycroft and Donaldson for the Admiralty, to contain two or more of these torpedoes, and to eject them one at a time against an enemy's ships. The idea is, to steam to a distance of a few hundred (less than a thousand) yards from the enemy, and eject a torpedo, with its engine, screw, &c. working, in the right direction; the head of the missile, if it dashes under water against an enemy's ship, will explode, and burst a huge hole in the ship's bottom. Or by another adjustment the explosion can be timed to occur in a definite number of minutes after the ejection. A missile of great cost this will be, whether it hits the enemy or not; seeing that the whole of it will be hurled to fragments if it explodes at all; a cost, per missile, of four or five hundred pounds sterling.

A school of torpedo-warfare has been established at Portsmouth; and there can be little doubt that foreign powers are doing the like. Alas for humanity and civilisation! It is contended, however, that all this *dintherie* will lessen slaughter, by deterring armed ships from coming within torpedo-distance; but a great naval war can alone determine the matter.

As to infernal machines, contrivances planned for some dastardly and nefarious purpose, an incident about four years ago gave us a little insight into them. A cargo of highly insured but worthless goods was shipped at a French port in a steamer, and in the midst of the cargo an infernal machine, intended to explode, destroy the ship and cargo, and earn the insurance money for the miscreant conspirators. The machine was a sort of chest, provided with explosive compound, an exploding apparatus, train of clockwork, primed cartridge, trigger or striking needle—the clockwork being timed to produce the explosion in a given number of days after leaving port. An occurrence at Bremerhaven a year or so ago afforded a further illustration of this application of scientific discovery and mechanical invention to purposes at once fraudulent and barbarous. Whether any case is on record of the *coal-torpedo* having been really applied to its Satanic purpose, we do not know; but that such a thing exists is certain. It is a hollow shell of iron, carefully

moulded from a lump of coal, and blacked to look like coal; an irregular cube of a few inches on each side, and filled with terrible combustibles of the dynamite kind. What does this mean? It means that a steamer laden with almost worthless goods insured at a very high value has a coal-torpedo purposely mixed with the coal in her bunkers, ready to explode whenever thrown into the furnace, or perhaps before! Another infamous contrivance, darkly hinted at, is the *rat-torpedo*, which, placed secretly in the hull of a ship, will after a time explode, and burst a hole in the ship's bottom. Specimens of these two kinds have come into the hands of European and American governments.

The Easter Monday torpedo in a place of public amusement, whatever it may have meant, was only one (the reader will perceive) among many forms of cylindrical, cigar, cubic, and globular missiles, of the 'Infernal Machine' character.

In the war lately commenced between Russia and Turkey, torpedoes are playing a notable part. The Russians, having a weaker navy than their antagonists, supplement the deficiency by employing these subtle agents. One Turkish war-vessel, guarding the passage of the Danube, has unquestionably been blown to pieces by Russian torpedoes, and its crew destroyed. The Russians have shewn much daring in approaching Turkish ships during the dark hours of night, attaching torpedoes to the ships' bottoms, retiring quietly and swiftly, and leaving the explosive monsters to do their fell work. On the other hand, torpedo-defence has been practised with some success by the Turks preventing the approach of torpedo-vessels, or fishing up the torpedoes themselves before they explode. Torpedo-tactics, in the naval warfare of the future, will evidently embrace the two parts of torpedo-attack and torpedo-defence. Where is it all to end?

CROSS-PURPOSES.

IN TWO CHAPTERS.—CHAPTER I.

'Is it very bad? Do you think it will mark her? How unfortunate I am.'

'Oh, it won't signify—*much*,' says the major, making a feeble attempt at consolation.

The groom is on his knees washing down the mare's leg. As he washes, the red raw patch shews out with ominous distinctness from the glossy dark-brown skin that surrounds it; and Cissy, standing in her riding-habit, whip in hand, regarding the operation, begins to look the very picture of ill-concealed misery.

'How dreadfully bad it looks *now*,' she says fearfully.

'Not at all,' replies the major.

'I cannot imagine how it happened; she is usually such a clean jumper,' goes on Cissy, diligently searching for excuses. 'I never in my life injured a mount before, and I would not have harmed *this* one for all the world. Captain Halkett will be so awfully angry.'

'Nonsense! You don't suppose he will *bite* you, do you? Think of his angelic temper and your privileges as a woman. He daren't blow you up, you know.'

'It is not so much *that*'—with hesitation. 'Of course I know he will *say* nothing, but he will *think* the more; and?'

'Like the parrot,' interrupts the major.

'And he will look so annoyed,' goes on Cissy, torturing herself with immense success. 'I would not for anything it had occurred. I do think I am the unluckiest girl on earth.'

'Are you in love with him?' suddenly asks the major sharply.

'In love with him? What an absurd question! Of course I am not,' says Cissy angrily, while blushing in the most furious and uncalled-for manner. 'What *can* have put such a ridiculous idea into your head?'

'Well' (sulkily), 'you are so afraid of vexing him, for one thing.'

'Not a bit more afraid of him than I would be of you or any other man, under the circumstances,' declares Cissy with exemplary candour. 'But it is not a pleasant thing at any time to injure a favourite hunter; and the mare, for some reason or other, is a special darling with Captain Halkett. Indeed, it was only yesterday I heard him saying he valued her more than any animal he had ever had.'

'Given him by one of the fair sex, most likely,' says the major with vicious intent.

'Very probably,' returns Cissy quietly, who carries a very game little heart beneath her pretty Irish skin, and would have died rather than betray any undue emotion. Nevertheless, it must be confessed her colour faintly wavers and fades away a little, only to return with tenfold brilliance as she sees Captain Halkett pass the stable window.

'Here he is!' she cries hurriedly. 'Now, what *shall* I do?'

'Nothing, if my advice is worth anything,' says the major sententiously.

Captain Halkett coming slowly up the yard, cigar in mouth as usual, and hands thrust deep in the pockets of his shooting-coat, sees Cissy, Major Blake—and the groom on his knees beside the mare. He takes in the whole situation at a glance. Throwing away his cigar, he turns to Cissy, and says pleasantly: 'Good-morning, Miss Mordaunt. Had a good day, I hope?'

'Yes; thanks—very—*that* is, *no*, not at all,' says Cissy nervously. 'I am afraid you will be horribly angry. But the fact is, as Major Blake and I were coming quietly home—cantering through the Park fields, at the last gap some sharp stone caught the Baby's leg, and has hurt her, as you see. I—I am so *very* sorry about it,' concludes Miss Mordaunt, genuinely vexed for the mishap.

'Don't say that,' entreats Halkett gently; 'and don't vex yourself. I would rather the mare was dead, than that you tormented yourself about her. Besides'—stooping to examine the injury—'from what I can see it is only *skin-deep*, and won't matter in a day or two; eh, *Comptroller*?'

'Yessir; only a scratch, sir. *Right as ever* in a week, sir.'

These words carry balm to Miss Mordaunt's breast; and presently the bandages being finally adjusted, and the Baby consoled by an additional feed, they leave the stables; and Blake considerably diverging to the right, Miss Mordaunt and Halkett go leisurely towards the house.

As they reach the stone steps leading to the

Hall door, Cissy pauses. 'You are *sure* you forgive me?' she asks sweetly.

'How can you speak to me like that!' says Halkett, almost angry. 'Did you think I should cut up rough with *you*? What an ill-tempered brute you must consider me; you ought to know me better by this time.'

'I have not known you for so very long,' says Cissy smiling; then impulsively, while her colour once more deepens: 'Why is that horse such a favourite with you?—beyond all others, I mean. Was it a present?'

'Yes,' says Halkett in a low voice.

'From a very dear friend?'

'Very dear; more than a friend.'

'From—a gentleman?'

'No. From a lady,' says Halkett shortly, and turns away his head.

On the instant, the words the major had uttered in the stables come back to Miss Mordaunt's mind, and without further comment she sweeps past Halkett into the house, and he sees her no more until dinner-time.

When half-past seven chimes out, and the solemn retainer of the House of Mordaunt announces dinner as being served, both Major Blake and Captain Halkett make a hard fight of it to take Miss Cissy down; but Fate, in the person of Sir Thomas Lobin, interferes, and balks them of their prey. Halkett, however, may be said to have the best of it, as he succeeds in seating himself directly opposite his Irish divinity, and so can watch the changes of her beloved face, and perhaps edge in a word or two, addressed particularly to her, during the repast. All this can be the more readily accomplished, as he has been told off to a young lady who, if not actually insane, is at all events three parts silly, and so does not feel it incumbent upon him to supply her with the orthodox amount of small-talk.

Major Blake falling into line, finds himself presently situated somewhat low down, with Mrs Fairfax on one side of him, and Grace Elton, a cousin of Cissy's, on the other. If it were not that his thoughts are altogether centred on Miss Mordaunt, he might have considered himself in luck, as he is undoubtedly in very good quarters. Grace Elton is as unaffected as she is charming, and extremely pretty into the bargain. But the major will neither acknowledge nor see anything beyond the tip of Cissy's nose, as it shews itself provokingly every now and then from behind the epergne.

On a line with Sir Thomas, and the third from him, sits Mrs Leyton the Indian widow, in a ravishing costume of pearl and blue that speaks alone of worth. She is looking wonderfully handsome to-night, and has a bright adorable spot on each cheek that is *not* born of rouge. She is keeping her hand in by trying a little mild flirtation with the vicar, who occupies her right, and is making very pretty play; while his daughter—who is almost too young for society—watching them from the opposite side, finds her mind much exercised, and wonders in her heart if Mrs Leyton is *really* very fond of papa. Surely she *must* be; else why does she raise her large soft dark eyes so tenderly to his once in every three minutes precisely, by the marble clock on the chimney-piece?

Aunt Isabel, at the head of the table, is radiant as usual, and dispenses roast turkey and smiles

with equal alacrity. She is carving with even more than her customary vigour and well-known proficiency, while at the same time she is listening to and adding a word here and there to every topic under discussion. She is, however, particularly attentive to Miss Lobin, who sits beside her, and who is as deaf as a post; though no trouble to any one except herself, poor lady, as she seeks not for conversation, and as long as she gets a bit of everything mentioned in the *menu*, is perfectly content.

There are two or three stray men from the neighbouring barracks scattered up and down; and these, with the three Misses Brighton—who being evidently not cut out by mother Nature for the civil service, have been considered suitable to ask to meet them—make up the party.

'Well, Cis, you had a pleasant day, I hope?' says Uncle Charlie, presently addressing his favourite niece.

'A delicious day, dear uncle; only we wound up with a misfortune. I was stupid enough to hurt Captain Halkett's horse on my way home through the Park; though indeed I scarcely think it was my fault. However, as it *seems* to happen, we were lucky in having it occur at the end, instead of the beginning of our day, as we had our ride in spite of it.'

As she makes this little speech, she never once glances at Halkett (indeed she has taken no notice of him since the commencement of dinner), and purposely treats the whole thing as unworthy of regret. Halkett, contrasting her pretty contrition of the morning with this off-hand dismissal of the matter, is, manlike, thoroughly mystified.

'I am sorry to hear of an accident,' says Uncle Charlie, who holds all good animals dear to his heart.—'Nothing serious, I hope, Frank?'

'A mere scratch,' returns Halkett carelessly.

'That is right. It could not have happened through any great desire on the rider's part to reach her home, as she delayed her return so long we all imagined an elopement had taken place. But there was no such excitement in store for us.—I do think, as your guardian and uncle, Cis, I have every right to know what you and the major were talking of all that time.'

'Politics,' says the major lightly; 'we never talk anything but politics.—Do we, Miss Mordaunt?'

Here Blake dodges to one side of the epergne, that he may the more surely get a full view of Miss Mordaunt's face.

'*Never*,' replies Cissy emphatically, dodging the epergne in her turn; and then they both laugh.

Here Halkett mutters something under his breath that is so far audible as to rouse the silly young lady by his side into some kind of life. She sighs and uplifts her head.

'Were you speaking to me?' she asks in a somewhat startled tone.

'No—yes—was I?' stammers Halkett, rather shocked. 'I *ought* to have been, of course; but I have fallen so low as to allow dinner to engross all my attention. Pray, forgive me. It comes entirely of going down to dinner with a middle-aged gourmet.'

'Dear me—I fancied you quite young,' responds his companion with a simper; and lapses again into silence after the effort.

'Politics!' says Uncle Charlie, going back to the subject, after he has desired the butler to take

several different dishes to Miss Lobin. 'How you must have enjoyed yourselves—especially Cissy. I never met any woman with such keen and comprehensive views on all matters connected with the state. It was only yesterday I asked her opinion of Gladstone, and she told me she always thought he was'—

'Now—Uncle Charlie,' interrupts Miss Mordaunt with such indignation, that the old gentleman, though chuckling to himself, audibly refuses all further information.

'May we not hear your opinion of Gladstone?' demands Sir Thomas, who is an old beau, and much addicted to Miss Mordaunt.

'Certainly not. And remember I distinctly forbid you to ask Uncle Charlie any questions when my back is turned; as he is capable of saying *anything* once my eye is off him.'

'Your will is my law,' says the old beau with a bow that would have reflected credit on a Chesterfield; and shortly afterwards, at a signal from Aunt Isabel, the ladies rising, leave the gentlemen to their own devices.

On entering the drawing-room, Mrs Leyton walking with the undulating graceful motion that belongs to her, and that cannot be acquired, goes straight to the fireplace, where she sinks into a lounging-chair, leaving the opposite one for Aunt Isabel, who almost instantly falls into a gentle doze. Little Miss Millar, the vicar's daughter, losing sight of her shyness in her desire to obtain her object, seeks a resting-place that will enable her still to keep a fascinated watch over Mrs Leyton, the widow having cast a glamour over the timid country maiden. The Misses Brighton and Grace Elton keep up a continual chatter, and are evidently enjoying themselves immensely; while Miss Lobin taking the cosy corner of the sofa, emulates her hostess, and letting her face lengthen until it reaches a state of utter imbecility, sweetly snoozes.

Cissy is standing in one of the windows, somewhat apart, she gazes out upon the stilly night, and softly cogitates. She cannot quite make up her mind whether she has been most sinned against or sinning; she cannot wholly approve her conduct at dinner, and finds it impossible to divest herself entirely of the idea that Halkett was looking miserable the entire time. But all men make a point of appearing injured when placed in the wrong position, and of course he had not liked her cross-examination of the morning. Yet again, why should he *not* receive presents from women? What right had she to question act or word of his? No matter what thoughts and hopes she may have encouraged in the secret recesses of her heart, she feels now she has no certain data to go upon to prove that Halkett cares for her beyond all others. Somebody—who was it?—had said he was a flirt. Well, one thing was positive—he should not flirt with her.

Here Aunt Isabel, slowly rousing, sneezes, and hems audibly, to let her friends know she has not been sleeping.

'Cissy, child,' she says, 'you will be perished over there. Come to the fire and warm yourself.'

'I am warm, thank you, and quite comfortable.'

'My love, I don't believe it' (with extreme mildness); 'it is freezing as hard as it can, and there is always a draught near a window. Come here, when I desire you.'

'Oh, I shall die near that blazing log.'

'And I shall die if you remain over there,' says Aunt Isabel; and carries her point.

'Better I than you, Auntie,' says Miss Mordaunt, and coming over, good-humouredly kneels down beside her kinswoman.

'Cold hands—warm heart,' murmurs the old lady, caressing the soft white fingers that lie upon her lap.

'A troublesome possession,' remarks Mrs Leyton with a lazy smile. 'No one is *really* happy in this world except he or she who carries an empty bosom.'

'Are you happy?' asks Miss Cissy innocently.

'Almost. The little worn-out article that beats here'—laying her hand over the region of the heart—'has pulsations hardly strong enough to cause me any uneasiness. Now and then I feel a faint pang—not often.'

'I would rather keep my heart, even at the expense of my suffering,' says Cissy warmly. 'She who cannot feel anguish, can know no perfect joy. Without love, life is a mistake, an unutterably stupid gift. That is how I think; but then I am Irish, and therefore of course unreasonable.'

'O no,' says Mrs Leyton graciously. 'The Irish are the most charming people in the world—so light-hearted, so quick to sympathise. Though I have been here only two days, and have asked no questions, I knew you to be Irish before you told me. Most of my friends come from your land; even Captain Halkett is half Irish, his mother being from Galway.'

'Yes?' says Cissy. She rather shrinks from mention of Halkett's name, and remembers with a slight pang how friendly have seemed his relations with Mrs Leyton since her arrival. 'Have you known Captain Halkett long?' she cannot help asking.

'All my life. His father and mine were fast friends; our childhood was spent together. Then we separated'—with a sigh, that sounds ominous to Cissy, but in reality is only born of past sorrow, utterly unconnected with him in any way—'to meet again after many years in India, and now—here. One way or another, all through, Frank's life has been mixed up with mine.'

Cissy bites her lip, and asks no more questions; but Mrs Leyton notices the action of the white teeth, and ponders.

'There is a great charm in Frank's manner, I think?' she says interrogatively.

'Is there? Most men nowadays are charming, as acquaintances,' replies Cissy carelessly. 'And Captain Halkett is too universal a favourite to be altogether charming to *one*.'

'Poor Frank!' laughs the widow lightly. 'He is unfortunate; or at least has found some one who cannot appreciate him. Then you mean to say you would find it impossible to care for any man who liked some other woman besides yourself?'

'Well, as you ask me the question, I confess I would,' says Cissy, who is feeling irritated, she scarcely knows why. 'I would divide honours with no one, and I would be winner—or nothing.'

'Then the man you love must be civil to no one else?'—with arched eyebrows indicative of surprise.

'Oh, "*civil*." Let him be as civil as he pleases. If you were talking merely of civility, I altogether misunderstood you. I only meant if I had a lover

—which at the present moment I certainly have not—I would wish to be first in his eyes. Let him be *civil* to all the world, but let him love *me*.'

'Quite so; that is only fair, I think,' says the widow, but she looks immensely amused; and Cissy seeing her expression, feels her wrath rising. 'I quite thought—judging from appearances—that you and Captain Halkett were very good friends,' goes on Mrs Leyton unwisely, and regrets her speech a moment later.

'I beg you will not judge *me* from appearances,' says Miss Mordaunt haughtily. 'A woman of the world as you are, Mrs Leyton, ought surely to know that people for the most part do not always feel everything they may look. And besides, you must forgive me; but if there is one thing I have a particular objection to, it is being watched and commented upon.'

'You are right,' returns Mrs Leyton with suspicious sweetness; 'I fear I have been very indiscreet; for the future I will not *watch* you and Captain Halkett.'

There is a covert meaning in this speech that is absolutely maddening; but the entrance of the gentlemen puts a stop to Miss Mordaunt's reply. She withdraws slowly, and seats herself upon a distant lounge, where she is immediately joined by Major Blake.

'I hope you have missed me,' he says with a tender glance, pushing aside her trailing skirts that he may gain room for his huge person. 'I assure you the time those men spent over their wine was actionable; while I was tantalised by dreams of fair women the entire two hours.'

'Two hours! What an exaggeration. Why, by Aunt Isabel's watch, that was never known to lose a minute, it was only half an hour.'

'What to me was two hours, to you was but a fourth of the time. How cruel an interpretation may be put upon your words! And I have been buoying myself up with the hope while absent from you, that when we *did* meet again, I should hear something kind from your lips.'

'And so you shall,' says Miss Mordaunt, bestowing upon him a radiant smile, just to let 'that woman' see she is not pining for the recreant Frank. But unfortunately for the success of the thing, Mrs Leyton is looking the other way, and does not see it at all, while Frank Halkett does.

'Must I confess to you? Well, then, my accurate knowledge of the hour arose from my incessant glances at the watch, to see if your delay in coming was really as long as it appeared—to *me*.'

'If I thought you *meant* that'—begins Blake hesitatingly, with a sudden gleam in his eyes (what man but feels more valiant after dinner than before?)—'if I really thought you meant it'—

'Well—"if you *really* thought I meant it"—what would you do then? But no!' she cries hastily, seeing she has gone rather far, and unwilling to bring matters to a climax—'do not tell me; I do not wish to know. My ignorance in this case no doubt is blissful; I prefer to remain in it.—And now to change the subject. Who is Mrs Leyton? and what do you know about her? I am all curiosity where she is concerned.'

'Do you like her?' asks Blake, merely as a precautionary measure.

'I can't say I do—exactly,' replies the Irish girl candidly. 'Now tell me where you first met her.'

'In India. Her husband was alive when I first

became acquainted with her. He lived tremendously hard; but he was devoted to her, without doubt, and she to him; and she took his death awfully badly. Never saw a woman so cut up by anything before; they generally take it pretty sensibly after the first shock, but she didn't; and went to a skeleton in less than three months.'

'She is not very thin now.'

'No. I suppose one can't keep on pining for ever, and in course of time good food *will* cover one's bones. But she felt it no end for months, and was altogether down in her luck. You see he got rather a horrible death, as his horse first threw him, and then almost trampled him beyond recognition.'

'How dreadful!' murmurs Miss Mordaunt, with a little shiver; and wonders how Mrs Leyton could ever have smiled afterwards.

'Yes; wasn't it? She took it so much to heart, that for years after she could not bear the sight of a horse, though she had the best seat in the regiment—amongst the women, I mean—and could not be induced to take a ride. Before leaving India, she sold, or gave away, every one of her horses.'

Here Cissy becomes intensely interested. 'To whom did she give them?' she asks indifferently.

'I hardly know; I was up-country at the time, but her most intimate friends, I suppose.—By-the-bye, Halkett was an immense crony of hers.'

'Indeed?'

'Never out of the house,' says the major, thinking it a good opportunity to improve his own chances, though really only giving voice to what had been the common report in that part of India where the catastrophe had occurred. 'After Tom Leyton's death, he would have married her like a shot; but she would not hear of it. She is a very handsome woman, you know, and tremendously admired by some fellows, though for my part I don't altogether see it.'

'Don't you? I think her wonderfully pretty. Perhaps she will relent, and marry him now; who knows? Certainly his constancy deserves some reward. Was it Mrs Leyton gave him the mare?'

'Don't know, I'm sure. But think it very likely, now you mention it, as he sets such uncommon store by her.—How very well Mrs Leyton is looking just now,' says the major, adjusting his eyeglass with much care, and glancing significantly at the other end of the room, where sits the widow in earnest conversation with Frank Halkett. Cissy follows the direction of his gaze, but, conscious of his scrutiny, takes care that not one muscle of her face betrays what she is really feeling.

Yes, very well, very handsome looks Mrs Leyton, as leaning gracefully back in her chair, with one hand toying idly with the rings that cover her fingers, she listens to Captain Halkett's conversation. Now and then she raises large dreamy eyes—half mirthful, half sympathetic—to his face, but scarcely interrupts him. He is talking with much earnestness—is apparently entirely engrossed by his subject—and takes no heed of what is going on around him. Presently he ceases, and evidently seeks an answer from his beautiful companion. She gives him one of her upward glances—all sympathy this time—and says a few words; but they are without doubt the right ones, as Halkett's face brightens, and a smile overspreads it that makes it positively handsome. At the moment he

raises her hand, and bending over it, seems to examine her rings curiously. To Cissy the action almost bespeaks a betrothal, and renders her half indignant, wholly miserable. Nevertheless, turning to Major Blake, she says with a bright brave smile: 'I think my idea was right, and even now he has received his reward.'

'Looks uncommon like it,' says the major with a sigh of relief.

NOTES FROM CHINA.

A MEDICAL gentleman at one time resident in China furnishes the following notes of interesting incidents within his knowledge. Though roughly put together, they may amuse our readers and be relied on as true.

In the month of January 1869, at about half-past seven P.M., I was sitting at dinner in my house in Swatow, when a sailor from the small gun-boat at that time in Swatow Harbour came running breathless and hatless, asking me to come down without any delay to the hospital, which I had built in the Chinese town on the side of the river opposite my own house. This man said there were thirteen sailors and the captain of the gun-boat badly wounded by an unprovoked attack of the Chinese. This looked serious indeed; so putting up instruments, lint, &c. I hastened down with the sailor. On reaching the hospital, the unwounded men of the gun-boat were still carrying into the hospital their injured comrades. I never saw a set of men so severely wounded without any being fatally so. I set to work, and extracted fifteen bullets from the men; but some were too deeply imbedded to get at that night. One man had one ear shot off, a second two fingers, a third was hit in the eye, a fourth shot in the breast, and I afterwards extracted the bullet at his back. The captain of the gun-boat had on a very thick shaggy pilot-coat, double on the breast; a bullet had cut right across his chest; and on examination I found the skin just raised where it had passed. A very singular wound was that of a young officer, whose two front teeth were knocked in by a bullet, that then disappeared somewhere in his palate. I never could find this bullet whilst he was under my care; but it seemed not to have done him much harm. He left Swatow; and I saw him three or four years later, and he said the lead had never appeared, and he had suffered no inconvenience from it. I believe it must have worked itself somewhere into the muscles at the back of his neck.

The cause of this raid of the Chinese was this: the captain of the gun-boat had merely taken out twenty-five men to exercise by rowing one of his boats up the river Han, on which Swatow is situated. This river is very wide at the mouth, and abounds in large creeks; on the banks of one of the largest of these, next to Swatow, are built three fortified walled-in villages, or what we would call towns, from their large population. The inhabitants of these towns were well

being particularly lawless, not having paid taxes for many years, and setting the mandarins at defiance. Seeing the foreigners (whom they detest) rowing up the creek, 'the Braves' (as they call themselves) rushed out in hundreds and fired into the gun-boat from each side of the river; and were it not for the nature of their guns, or as the Chinese call them 'gingals,' which are old-fashioned and of short range, none of the boat's crew would have returned alive; as it was, fourteen men were well riddled; and the boat, which I saw afterwards, had as many holes in it as a colander. The sailors rowed away for their lives, and escaped.

Our settlement, on hearing this story, was in great and just alarm. These people detest the foreigners; and having put to flight their supposed enemies in a crippled state, it was very likely they might follow this up by an attack on the settlers; and had they only sufficient courage, their numbers were so great, that our fate would have soon been decided by pillage and murder. The British consul, Mr Alabaster Challoner, saw the danger; and being a man of decided character and great energy, without any delay sent a merchant-ship that was in the harbour under high steam-pressure to Hong-kong to inform the Admiral of what had happened. The reply was prompt and satisfactory; for a few hours brought Admiral Keppel, Lord Charles M. Scott (son of the Duke of Buccleuch), two frigates, and seven gun-boats into Swatow Harbour, to the great satisfaction of the foreign settlers and of Mr Challoner. This gentleman was a small delicate-looking man, whose neck being a little crooked, made him hold his head on one side; but such was his courage, determination, and inflexible sense of justice, that the stoutest Chinese officials trembled at his look; and they all declared they would rather face a tiger than meet the glare of 'His Excellency the Devil's' eyes when displeased. The Admiral immediately told off five hundred marines and blue-jackets, fully armed and supplied with two small cannon, to punish the offenders. The friendly natives of Swatow averred loudly that these men were going to certain destruction; that not one would return, as the tribe in question was invincible; and most of the foreign merchants were sufficiently alarmed by these assertions to send all their most valuable possessions on board the vessels in the harbour. Fortunately the result was not what they dreaded. On approaching the first town, the troops saw 'the Braves' in vast numbers on the walls, shouting, waving flags, jumping up and down, and calling on them to come on and be killed. The tars replied by blowing open the gates with gun-powder, and falling on the heroes, who instantly gave way and fled precipitately. They then set fire to the place, sparing all who did not resist. They treated the other towns similarly, and returned victorious. The excellent effect of this prompt action was to produce a complete tranquillity in the neighbourhood of Swatow, which has remained undisturbed ever since (eight years), and a feeling of security which never before existed; yet the Admiral was reproved by the British government at that time for having acted without 'home orders!'

In the winter of 1873 a very unseaworthy merchant sailing-vessel (a Siamese), the *Tye Wat*, set out from the north of China to Siam with a

cargo of beancake, &c. The weather became excessively stormy, and at last the old vessel actually went to pieces many miles from land in the Gulf of Pe-che-le. The crew consisted of eight Malays, who worked the ship; the captain, an Englishman; and in addition was one Chinese woman. They had no boats on board, no time to make a raft or means of doing so; and as the vessel was rapidly sinking, the wretched people looked round in despair; when a hope of escape struck one of them as his eye lighted on a very large wooden water-tank which was on deck. This tank was strongly made, about six feet long, five feet across, and five feet high, with a large hole at the top into which a man could squeeze, and a tight-fitting cover. There was not a moment to lose: a hole was bored in the bottom, to let out what water it contained, then quickly plugged; and all ten squeezed themselves in hurriedly, put on the lid, and awaited their fate. In a quarter of an hour after they were thus packed, the ship sunk under them. They first whirled round, and then floated off freely, and felt themselves rolling and tossing about frightfully on a stormy sea. The weather was intensely cold, so much so that icicles had hung from the rigging of the sunken ship the day before; and being so tightly packed, perhaps it was fortunate the weather *was* so cold. In their haste to save life, they had brought only part of a ham which the captain had snatched up, and a bottle of brandy; and thus these poor creatures were tossed about from day to day, hungry and thirsty, jostled like potatoes shaken in a barrel; now and then, when they dared, letting in a little air by raising the lid. Their situation strongly reminds one of Gulliver in his box when the eagle carried him out to sea from the land of the Brobdingnags.

On the fifth day the Malays said they must kill and eat the English captain; but the poor Chinese woman (to the credit of her sex) vehemently opposed them, and succeeded in saving him for that day. On the sixth day the Malays said they *must* eat her; but the captain in turn saved *her* for that day. It is difficult to imagine a more horrible situation than that of this poor Englishman surrounded by eight starving men determined to eat him, which they certainly would have done had not an English vessel rescued them on the seventh day. It happened thus: the captain of that vessel sighted a large box tossing on the waters, and at first never thought of minding it, only supposing it part of some wreck, as the weather was so bad; but as he looked, to his utter surprise a head popped up through the hole in the centre, and then vanished, to be followed by another figure, making frantic gesticulations. With much difficulty this strange box was got alongside, hauled up, and its poor inmates dragged out to light barely alive, and emaciated fearfully, finding the man-hole easier to pass out of than to get into; which was reversing the fable of the weasel who got into the barn. The captain of the rescuing vessel was a kind Englishman, and did all in his power to restore his guests. They were still in the Gulf of Pe-che-le; and did not reach the port of Swatow sooner than six days, where a doctor was called in to visit these liberated 'Jack-in-a-box.' He said they were a singular proof of how much human beings can endure. All lived, and recovered perfectly. Certainly they were all *young*

people. The Malays went home. The English captain went to Singapore, and shewed himself really grateful to the poor Chinese woman who had saved him from the jaws of the Malays.

UNSUSPECTED WAYS OF EARNING A LIVELIHOOD.

'WHY, sir, we never should wake of our own accord, specially these dark mornings, if we hadn't somebody to knock us up.'

The speaker was a worthy artisan whom I often used to meet at a certain steam-boat pier on the Thames; his after-breakfast labours appearing to begin about the time I usually was in waiting for the boat.

'You see, sir,' he continued in answer to a question I had put to him—'you see, sir, there's about sixty of us hereabouts down by the water-side; and there's so much that depends upon the tide, that we have to be called at all hours—sometimes two o'clock in the morning, or three or four, just as the case may be.'

'But who is it calls you?' I asked. 'A policeman, I suppose?'

'No; not a policeman,' my companion answered; 'it would take up a deal too much of his time; besides, fresh policemen are always coming on to the beat, and we could not be bothered with constantly having to shew and tell a new man the way.'

'Well, it must be rather an awkward matter,' I observed.

'No; it isn't. We each pay fourpence a week to Phil Larkins; and he wakes us as regular as clock-work.'

'But if sixty people want to be called at all sorts of irregular hours, how does the awakener manage to know his duties?' I asked.

'Oh, we chalk on our doors or shutters the time, and that way he knows. Phil is to be depended upon always. But he very nearly lost the work a year ago, and it was a shame. Some fellow wanted to step into his shoes, and morning after morning went and altered the chalkings, so that we were either called two hours before our time, or overslept ourselves, and so got into trouble. There was no end of quarrels and misunderstandings till the trick was found out. And I think the rascal who did it deserved a ducking—only, you see Phil is such a little fellow he couldn't give it him.'

'It was a dastardly trick!' I exclaimed with indignation, bidding the man good-bye.

Another speaking acquaintance of mine was an old man whose duty consisted in sweeping down the steps which were submerged at high-tide, but quite bare at low-water. I had often seen him at work cleansing from mud and silt step by step as the tide receded; and now it occurred to me that from the nature of his occupation he, of all others, must work at the most irregular hours. It was a dull wintry morning, but the old man was working cheerfully at his accustomed task, which, as the water was getting low, was very nearly completed. He was pale and thin, but had that air of decent respectability which happily is often seen in the very humblest classes.

I opened the conversation in true English

fashion by a remark on the weather, asking his opinion as to the probability of rain.

'Snow more likely,' he answered laconically, but quite civilly.

'I daresay you are right,' was my reply, 'for I should think you are one of the weather-wise people.'

'Ought to be, if there's anything learned in being always twelve hours in the four-and-twenty out of doors all seasons,' was the rejoinder.

'Rather hard work for you, my man,' I said sympathisingly.

'I don't complain. There's lighter work to be sure, but there's some that's a deal heavier; and after being at it so many years, maybe it comes easier to me than it would to another. I was only fifty-five when I began, and now I'm seventy-three.'

'And is it necessary that you should work all the six hours that the tide is ebbing?' I asked, really desiring the information.

'Quite necessary,' he replied, descending a step, and plying his broom vigorously as he spoke. 'Why, if I did not begin at the beginning and go on regularly, the mud would harden, and I should have to drag up buckets of water to wash the steps with. And gentlefolks want nice clean steps going to the boats.'

'I suppose you are glad when your work does not happen to be in the dead of the night?' I observed.

'I don't know that I care. It is the change in the time that makes the variety in the work. And sometimes on fine nights, when the stars are blinking and winking, or the moon floating in the sky, with the clouds rushing along as if every now and then they were washing her face—I think things and feel things as I don't at other times. I think it's a mistake for people always to sleep of nights, I do.'

'I suppose you depend on some one to call you up at the turn of the tide?' I said inquiringly.

'No; I don't,' replied the old man, with a shake of his head. 'I tried that at first, but it didn't answer. I daresay Larkins might do it; but it was before he took to the business of knocking at doors; and the man I trusted to made mistakes or else forgot, and didn't wake me right, and I very nearly lost the place; and ever since I have trusted to myself.'

'Then how do you manage?' I said.

'That is just what I don't know, except that it seems to me it is managed for me. I only know that if it is high-water in the dearest hour of the night, I always do wake. It is just as if something said: "Look alive; time's up;" and sure enough it always is. I often wonder at it; but I have come to think that wondering is of no more use than wondering at the tides coming up so surely, and the new moons shining just as they are expected, and the stars all keeping their places so safely. O sir, some folks, no doubt, are very learned, but there's a deal more in the world than people can ever make out.'

'Do you know, my friend, that you are speaking the thoughts of one of the greatest of men?' I exclaimed, reflecting on Hamlet's words to Horatio.

'Am I? What did he say?' was the rejoinder.

'He said,' I exclaimed, '"there are more things in heaven and earth than are dreamt of in our philosophy."'

'Well, he was right, whoever he was,' exclaimed the old man, with a sort of innocent satisfaction at his own corroboration of a great man's words. 'And what's more, I think the world would be a worse place than it is if we had nothing left to wonder at.'

'I heartily agree with you,' was my reply.

'And there's more to wonder at than even the stars and the tides,' continued the sweeper, 'and that's the ways of men, the good and the bad that's in the most of us. But then I do think we river-side people see more than others, what with the partings and meetings going on; and now and again the dead bodies that come to shore, and sometimes the miserable despairing people who would drown themselves if they weren't hindered. Well, it's these things that set me wondering and thinking, and that make the working hours pass quickly, especially at night.'

'You seem a bit of a philosopher,' I said admiringly.

'What's that?' cried the old man.

'It means lover of wisdom,' I replied; 'and he is happy who can justly lay claim to the title. My friend, we must have another talk another day.'

'Well, sir, you'll always find me here according to the tide; leastways unless I am ill again, as I was last year.'

'How was that?' I asked.

'Well, I don't quite know myself,' the old man answered, 'for I don't remember much about it. When they found the steps neglected, some of the wharf people came to look after me, and then they took me off to the hospital, where I was for a matter of six weeks. You see, sir, since my poor old missus died I am all alone, for my grandson went to sea; his father is a soldier; and my daughter has been in service these thirty years; so I had no one to go for a doctor or give me a drink of water.'

'Oh, that was very sad,' I exclaimed.

'Well, it was rather hard lines; but you see no one knew how I was taken; and when they found me, folks were mighty good to me, and they gave me back my place when I got well; so I ought not to complain.'

The boat by which I travel was now nearing the pier, and I stepped on board, with a friendly nod to the old man, reflecting with some sympathy on the many such stories which doubtless, if we knew them, would serve to swell

'The short and simple annals of the poor.'

F R O T H.

CHILDREN sometimes ask, and men and women need not be ashamed to ask, why is froth always white or nearly white, whatever may be the colour of the liquid underneath it? To answer the question, we shall have to determine what froth really is in itself, and how it is formed.

Take a filled ale-jug, or the well-known 'pewter' of a tavern or public-house, and pour out gently into a glass: scarcely any froth is produced. Pour out the self-same liquor from the self-same vessel in a stream several inches high, and you produce a foaming 'head,' which to the eye seems to be a substance quite different from ale or beer. Open a bottle of lemonade or ginger-beer, of soda-water

or seltzer-water, and pour out the contents into a glass; the formation of froth is so rapid and abundant that the glass appears full when it really contains but a small quantity of liquid. Open a bottle of Bass's ale or of Guinness's stout; the froth is still more opaque and pronounced. Look at a cup of tea or coffee soon after the sugar has been added; there will often be seen a small covering of froth on the surface, which froth, if not actually white, is much more so than the liquid beneath. Watch the movements of the paddle-wheels of a steamer; the water thrown back from them is covered with foam of dazzling whiteness, the intensity of the white increasing with the rapidity of the wheel's motion.

In all these cases, and in multitudes of like kind, the froth seems to result from agitation; a quiescent liquid seldom presents symptoms of this nature. But agitation alone would not do it. Supposing it were possible for human beings to live, or for pints of ale to exist, without air, there would be no such thing as froth. In pouring out ale or other liquid, the falling stream becomes mingled with a portion of the atmospheric air which surrounds us; and it also buries, as it were, the air contained in the apparently empty glass: the result is, a mixture of ale and air, instead of ale only. Under ordinary circumstances, liquids contain as much air as they are capable of absorbing; the additional quantity is expelled. But how? It cannot rise in a body to the surface, but divides into minute spherical portions or air-bubbles, which ascend to the top of the liquid on account of their levity or comparative lightness.

This, however, is not all; if it were, the bubbles would burst directly they come to the surface, and froth would not have an opportunity of forming. Cohesion comes into action, the cohesion between the particles of every liquid. The bubbles of air, as they rise from the body of the ale, beer, or other liquid, are able to penetrate between the particles; but when they arrive at the surface they encounter a film of liquid cohesive enough to restrain for a time their final escape into the atmosphere. Froth consists of bubbles, each a tiny globular portion of air, bounded on the upper surface by an exceedingly thin film of liquid; the bubbles retain this position and condition until the struggle ends as a victory for one of the belligerents. The ascensive power of the air within the bubble overcomes the cohesive power of the liquid film or covering, and 'the bubble bursts'—our beverage loses its frothy 'head.' The length of time that elapses before the air escapes by the bursting of the bubble depends chiefly on the viscosity of the liquid. If we pour ale into one vessel and water into another, from equal heights, we shall find that the former will present a frothy surface, the latter a more instantaneous sparkling appearance; the power of retention being greater in the former instance than in the latter. In other words, ale having a greater specific gravity than water, and also greater viscosity, the bubble formed has a thicker coating, and requires a longer time for its disruption. Taking the round of all the 'frothy headings,' we find the same rule prevail. In the spray from the paddle of a steamboat, in the froth on the surface of beverages, in the sparkles on a cup of tea, the air is in the first place entangled among the particles of liquid, and thus forms bubbles in

the struggle to escape. Although carbonic acid may, in regard to physical properties, be ranked as a kind of air, the formation of froth in effervescing liquids is slightly different.

But why is froth *white*? Porter, ale, tea, coffee, champagne, water, differ very considerably in colour; yet in all of these, when froth is produced it is white. This appears to be due to the reflection of the light from the outer surface of the several bubbles. When the surface is thus broken up, we have a cluster of little spheres, each of which presents a reflection to the eye from some part of its surface; and as there may be tens of thousands of these in a very small space, the effects become united, and are recognised as a whiteness. It is simply an aggregation of small effects to produce one more conspicuous. If the bubbles are large, then fewer of them can be contained in a given area; consequently the number of convex reflecting surfaces is smaller, and the united effect less brilliant—in other words, less white.

But it may still be asked by some of us, how is it that the froth of a *reddish* liquid, such as beer, is white? The phenomena of reflected light must again be appealed to for the means of solving this problem. The colour of a liquid (not its froth) is determined by the transmitted light, not the reflected. If liquor be contained in a transparent glass vessel held between the eye and the light, and we look *through* it, the eye receives the light transmitted by the liquid, and deems the colour of that light to be the colour of the liquid itself; but if we pour the liquor into an open vessel, and look *obliquely* at the surface, we shall find that the colour does not deviate much from whiteness, whatever the transmitted colour may be. The liquid, whatever be its body colour, is when agitated broken up into detached portions at its surface by the formation of bubbles, and each bubble reflects to the eye a portion of the light which falls upon it. Consequently, if this reflected light is nearly white in all cases, the resulting assemblage of bubbles, generally known as froth, must always appear white or nearly white. We can easily understand the greater yellowness of the froth on strong Dublin stout than that on pale Burton ale; the more tenacious liquor forms a thicker and consequently less clearly reflecting bubble than that on the more limpid.

A CITY WEED.

I PASSED a graveyard in a London street,
Where 'stead of songs of birds, the hoarse sad cries
Of wretched men echoed from morn to night.
Locked were its gates, and rows of iron bars
Fenced in God's Acre from tired wanderers' feet.
All broken lay the slabs which love had raised;
But on a mound where fell a patch of light,
A Bindweed grew; and on its flowers, with eyes
O'erflowing with a wintry rain of tears,
A pale-faced, miserable woman gazed,
Heart-sick with longings for the nevermore,
And faint with memories of bygone years:
A breezy common with a heaven of stars,
And lovers parting at a cottage door.

A CORNISH HAVEN.

COME away with me to the sea! Let us go to Cornwall, where sea and air are of the purest and most exhilarating. Jumping into the train and proceeding westward until we come to Launceston, there we will leave the little quiet old-world town behind. So anxious are we to get to the sea, that we will not even stop to climb the hill and inspect the old castle which frowns down on us; but we will mount to the box-seat of the three-horse coach which stands waiting at the station, and drive away—still westward. Away, over the breezy uplands, where the cattle chew the cud sleepily beneath the August sun, between hedges set with brilliant jewels, which we call flowers, past undulating downs in whose hollows the purple shadows lie dreaming.

We stop presently at a little roadside inn, to give the horses a rest and a feed; and I climb down from my elevated position and partake of a cup of tea in the inn kitchen—a primitive flagged kitchen, with a great high-backed wooden settle by the fire, and pewter bowls and cups shining on the walls. They pour out my bohea from a teapot which a fancier of old china would pronounce to be priceless. Genuine old 'Plymouth' it is, I see, and ask if they would be willing to part with it. But no; 'It was granny's;' and they would rather not sell it; so I turn my covetous eyes away, and clamber back to my seat beside the coachman.

Off we go again, along a fairly level road. The country is but thinly inhabited, and there are long intervals between the houses. By-and-by we begin to descend a hill, and enter a little sleepy town, where at first sight it seems to me that there are an inn and one or two shops, but no inhabitants. Only at first sight; for as we draw up before the *Hotel* (such is the proud boast I see over the doorway), and the driver descends and walks away to deposit a parcel or two and to gossip awhile with his acquaintances, we are delivered over to the tender mercies of the whole juvenile population, who surround the coach, climb on to the wheels, and make audible com-

ments in very broad vernacular on our personal appearance and on our apparel.

This time we move off slowly, for we have a very steep hill to encounter, and the tired horses plod somewhat wearily up it. As we reach the top, and they stop panting to rest, I see far away on the horizon a silver streak, and my heart gives a throb of delight; for I have in its intensest form all an islander's love for the ocean, and I know what that silver streak is on which the sun shines so gaily. On rolls the coach merrily; the horses sniff the air, and seem to know that they are nearing home. Yes; here are the breezes we have come to look for. They peer familiarly under my hat; they blow my veil aside, and rudely kiss my cheeks; and their breath is fresh and salt, and whispers of new strength to the tired mind and body. On we hurry towards the setting sun, who is now mounting the chariot in which he drives away to the other side of the world. We have lost sight of the faint line of silver again, and our view is almost bounded by the dusky hedges. Presently we turn a corner abruptly, and there, apparently at our feet, lies the blue Atlantic, smiling bright welcoming smiles at us in the last rays of departing Sol. The active young breezes, which seem so glad to see us again, revive us with sweet aromatic odours, which they gather from the weed-strewn rocks. They evidently think we are wise people to have left those weak-minded little zephyrs coquetting with the flowers on the lawn at home, and to have followed them to their sporting place beside the restless ever-changing sea.

In another moment we stop, and all the tired travellers dismount and stretch their cramped limbs. I hear many around me inquiring for hotels or lodgings; but we are expected, and here is our landlady's husband come to meet us; so we hand over our luggage to him, and wend our way to Cliff Cottage. Here we find a smiling hostess, who tells us how glad she is to see us; and after we have removed some of the dust of our journey, we sit down to a well-spread tea-table, on which a noble Cornish pasty holds the post of honour. We

draw the table into the bow-window, which faces not directly seawards, but towards the bay, which has been a haven of safety to so many. But it is growing dark already, and we are weary with our long drive; so, soon we seek our fragrant chamber, in which the lavender scents struggle faintly to overpower the pungent aroma of the sea; and it is not long before we are lulled to sleep by the monotonous thunder of the waves on the rocks below.

In the morning we peep out at the colliers which ride safely in the little sunny bay, at the white houses which are dotted here and there over the cliffs, and at the little village itself lying snugly in the hollow. To right and left, sweeping far away, stand the great eternal sea-walls of sombre iron-stone crags, and the grassy downs rolling away inland, unbroken except by a lonely stone or a patch of golden gorse; and beneath us lie ancient gray boulders and stretches of yellow sand. Away on the hill opposite stands the little church, in whose quiet graveyard rests many a sailor who has found his death in the pitiless sea. Eleven graves mark the resting-place of the crew of one vessel, whose figure-head forms an appropriate headstone to the sad group.

The first thing to be done after breakfast is to bathe. It is not enough to be *by* the sea; we must be *in* it, if we wish to rob it of all the strength and vigour we can; so we start off over the downs to where a sudden depression in the cliff leads to the bathing beach. Here we find old Harriet the bathing-woman, browner than ever, who gives us a cordial welcome. The bathing is primitive in the extreme. Harriet possesses two tents, which she pitches daily on a smooth spot of sand. For the use of one in which to disrobe you pay a ridiculously small sum, which also includes old Harriet's watchful 'surveillance' while you are in the water. As the number of tents is so limited and the bathers many, not a few avail themselves of the shelter of a friendly rock behind which to perform their toilet; but I am squeamish, and wait my turn for the tent. And oh! how reviving the plunge into the surf, which comes rolling in frothing and seething like champagne, and which knocks me over and plays at ball with me as if I were a cork! The cool waves curl and cling round me, and kiss my arms and hands lovingly with their wet lips. I let them break over my bowed head, and clasp them tenderly to my breast; but they slip away from me, and riot and tumble round me with joyous laughter, sprinkling eternal freshness from their bounteous hands. I sniff the keen salt air with delight, and let the foam toss me to and fro at its own sweet will, until Harriet, who watches me anxiously (she thinks me a somewhat rash young person, I know), orders me authoritatively to come in, saying I have had enough of it—for the first time. Very reluctantly I obey; but it would require a braver person than I am to contradict the withered old sea-symph, and soon I emerge

from the tent with streaming locks, feeling like a giant refreshed.

Thank goodness, here are no brass bands, no esplanade; a circulating library of such modest pretensions that it does not circulate, and shops in which it is next to impossible to spend any money! At the chemist's we buy our groceries as well as our drugs, and he is the only wine-merchant the dear primitive little place can boast. But we get mutton which transcends Southdown; capital poultry and vegetables; butter such as I have never tasted before or since; rich cream, which you must call Cornish (not 'Devonshire'), to please the buxom farmer's wife who supplies it to you; and plenty of good fruit. And what do you want more, with such a sky above you, such a glorious sea at your feet, such a wall of ironstone crags behind you? Down on the beach we go, and dawdle away the hot summer afternoon. We stretch ourselves on the tawny sand, where great barriers of rock jut out on each side of us, beneath the shadow of a dreadful scarped cliff, to which no scrap of weed or herbage seems able to cling. We look up at it with a sense of awe. We think of the many ships, nearing home after a weary journey, which have been driven by the storm's pitiless whip straight into its terrible arms, there to meet a dread destruction. We think of the many struggling drowning wretches on whom it has gazed down with its stony eyes during all the ages it has stood there. The great billows in their winter's fury have beaten and lashed it until it is scarred all over; but still it gazes calmly down at them, as if defying their malicious rage. And yet, cruel as it is, how picturesque the colouring as it ranges from the intense purple black of the tide-line, through warm green and brown shadows, to the bright high lights far away above our heads.

Dark rock-pools lie behind us, lined with queer zoophytes and delicate sea-anemones; beside us are the crimson lady's finger and the golden trefoil; the dainty scents of the sea-weed and the fresh wet sand are in the air, and before us is the smiling sea. Yes; he smiles at us to-day, though here—with a restless surf breaking eternally on the beach—he is never calm and rippling, as we see him in more southern climes.

Presently the sun sinks lower in the heavens; a breeze awakes, and the day turns cooler; so we go for a walk along the smooth firm sand, which the ebbing sea has left bare; through a wilderness of weird black cliffs, which, when the tide is high, range far out into the sea in castles and turrets and spires of jagged rock; an iron-bound coast indeed, hopeless to the shipwrecked mariner, save for our friendly little haven. Far away on the warm horizon hangs Lundy Island, like a shapely gray ghost; very faint by day, and at night telling us only by its revolving light where it is. We walk on to a gorge up which we can make our way to the top of the cliff, and homeward over the undulating downs and by the banks of golden broom. We pass through a little village, where the myrtles and fuchsias are all abloom in the cottage-gardens, and where the great yews brood silently over the old gray church. The door stands open, and we go in. What a dear old church, with its quaintly carved oaken pews,

and tender-hued stained glass windows! Evidently the restoration-fund has not reached here yet. Let us hope that he will stay away, along with the esplanade and the brass bands.

Sometimes we spend our afternoon or evening out at the end of the breakwater, which forms one side of this little mariner's refuge. It connects a rock which stands right out at sea, with the shore, and occasionally in spring-tides is quite under water. One evening, while standing on the far end watching the glorious setting sun, we forget to look behind us, and turning suddenly, find the breakwater submerged. A man could still cross it perhaps, but a not over-strong woman might easily be carried over and drowned by the on-coming surf. I am not brave enough to face it; so we remain where we are, and enter into conversation with a stalwart Cornishman, who, with the instinct of a true gentleman, volunteers—as the lady seems nervous, and as he knows all about the tides, and exactly how high the sea will rise to-night—to remain with us until we are released by the ebbing waters. I rather resent the imputation of timidity, but am very glad he has imprisoned himself with us, as the night turns darker and darker, and the waves creep higher and higher, and wheel and foam and thunder around, as if in impotent rage at their inability to reach their prey.

Our Cornish hero reassures and consoles me, telling me that they cannot possibly reach to where we sit; and he whiles away the time with stories of wrecks which he has seen, and also of many hair-breadth escapes. He tells us how a ship driving straight on to the cruel rocks, was lifted by one giant wave over the breakwater and 'landed safely in the harbour beyond;' and I steal a glance behind me, and see with thankfulness that the waters are abating. In a little while longer, with the help of our pleasant companion, I am able to get over dry-shod, and it is with a feeling of relief that I find myself once more on mainland.

From this breakwater too, on a stormy day we watch the life-boat go out for practice. How gallantly she breasts the breakers, which seize her and whirl her backwards, as if defying her to leave the shore. The seamen tell us that in the great storms which arise here during the winter she is perfectly useless. No life-boat could live in the seas which beat upon this heartless coast. Often the coast-guardsmen have to creep on hands and knees to their signal-station, as, standing erect, they cannot face the wind. But the rocket apparatus has saved many and many a life; and we also one night see that fiery messenger of life and hope speed away into the darkness over an imaginary wreck; and a fictitious shipwrecked mariner comes on shore in the frail-looking apparatus, which slides along the rope, swaying to and fro in the angry wind, looking like a frail thread, suspended as it is in mid-air over the vexed and tumbling waters below.

Sometimes we make excursions—to Tintagel Castle, where King Arthur dwelt with his knights; or away to wooded Clovelly, where Will Carey lived, and Amyas Leigh suffered, and Rose Salterne loved. Or to Stratton, in the neighbourhood of which a great battle was fought, in 1643, between the Parliamentary and Royalist troops, in which the former, under Waller, were

defeated. A cannon found on the field marks the site of the combat; and in the High Street of the town, a slab let into the wall of an old house bears a legend telling how Sir Bevil Grenvil, the victorious general, rested there after the fight.

But we like best to spend our days wandering over the sands and the ancient mussel-clad boulders, or straying across the breezy downs into the rich smiling corn-country beyond, where in the hedges the pale wild roses are transforming themselves into brilliant scarlet hips, and the sun is beginning to dye the blackberries a luscious purple. Then as the day begins to tire, and prepares to go in royal state to her rest, we love to sit out on the rocks listening to the weary surges which sing her a sweet monotonous requiem, and watching the scarlet flames in the west steeping the wet sands in a crimson stain as of blood. A great belt of iron-gray clouds encircles the horizon. Slowly the sun sinks behind it, gilding its edges with a rich luminous glow, which faintly shadows forth the glories the clouds veil from our eyes. Lower and lower he droops his head, heavier and still heavier with sleep, until one brilliant flaming eye is all that we can see. Then the lid drops over that too, and he is gone. Spell-bound, we sit on, listening to the sea's mournful dirges, while night swoops down over earth and ocean with dusky wings. We watch the moon, like a vain lady attiring herself magnificently in the east before she issues forth on her evening pilgrimage. She sends her handmaidens, the stars, before her, and they light up her pathway with their brilliant lamps. Then she comes forth robed in a filmy veil of pearly lace, and mounts silently into the sky, until she sits enthroned far above our heads. She kisses the white crests of the waves, and crowns them with silver, and peers with gentle eyes at the solemn gigantic black cliffs, until they seem to lay aside something of their stony harshness in the light of those poetic orbs. The long oar-weeds waving in the water seem to beckon to her with inky fingers, and a few giddy young stars obey the summons, for some of them have fallen into the quiet rock-pools, and gaze up at us out of their calm depths. The phosphorus awakes and shoots out tongues of lambent flame, as if seeking to outvie the splendour of the queen of night. The waters glow as if they were on fire, and the great dark billows rush in and cast sparkling jewels at our feet.

How shall we resolve to leave all these delights? Wild ocean is so kind to those who love him and do him homage. He gives them back the strength of which the struggle and turmoil of the world have robbed them, and refreshes the weary spirit with his gracious sights and sounds. Nature is no step-mother, and for those who look at her most tenderly and love her best, she paints her fairest pictures and sings her sweetest songs.

But soon, too soon, the day comes when we must bid good-bye to the kindly folk we have grown to love so well; when we rest for the last time in our sea-odoured chamber; when we take our last walk over the downs, and loiter for the last time beneath the shadow of the time-worn cliffs. We leave the dear quiet little place, where we have for a time hidden from the busy world, and rested on our march; we leave it to the winds, which grow ruder and more boisterous day by day, and which soon will drive many a mariner to take

refuge in its friendly haven. We shall find our own little zephyrs at home quite grown up, and strong enough to give us many a blow during the winter.

But if there be any who, like me, would love to linger on its quiet beach, to make acquaintance with its giant wall of rocks, to drink its keen life-giving breezes, to watch its gorgeous sunsets, or dream beneath its silver stars—then, let them take coach at Launceston, and following the declining sun, drive westward away to—Budehaven.

THE LAST OF THE HADDONS.

CHAPTER XXXIII.—‘A WOMAN’S ERRAND.’

AFTER making two or three attempts to obtain a private interview with me, and finding that it was not to be, Philip did not stay very long, explaining that he had only come down for the papers, and had business in town for the remainder of the day. Somewhat more gravely and quietly than usual, he shook hands with Mrs Tipper and Lilian; and then, in a matter-of-course way, said: ‘Come, Mary.’

I knew that I must not refuse. Murmuring an excuse for a moment, I ran up to my room and fell upon my knees, asking for the strength I so sorely needed for the coming trial; then joined him again, and we went out together. As we walked down the lane, I felt that he too was nerving himself; and presently he asked, in a low grave voice: ‘What made you talk in the way you did just now, Mary?’

I was in a difficult position. If I attempted to justify myself, he would take alarm at once, and bind me and himself still closer to our bond. I could only treat it as a jest.

‘We all talk nonsense sometimes, Philip.’

‘I suppose so; but that is a kind of nonsense you have not taught me to expect from you.’

‘I am afraid you expect too much from me.’

‘I certainly expect a great deal.’

Fortunately, I had something to say which would keep off love-speeches; and without any attempt to smooth the way, I said it.

‘Philip, I want to ask you to give me ten pounds. I have spent all my money.’

Oddly enough, he did not know that I was entirely without money. I had thought it sufficient to tell him only that my dear mother’s income died with her, not wishing to pain him with the knowledge that I had been so nearly destitute. I think he imagined that I had a small income of my own, and as I avoided the subject, did not like to appear curious about it. Even now, I believe that he did not suspect me to be entirely penniless, merely supposing that I had spent all that I had in hand. The five-and-twenty pounds had been expended to the last shilling in furbishing up my modest wardrobe, and for small incidental expenses in the way of my share towards the cottages, &c. I had shrunk from the idea of making him acquainted with the state of my finances; knowing how large-hearted he was, and how much would be forced upon me if he once guessed my need. Mrs Tipper was always protesting against the value and number of the offerings which found their way to the cottage, whilst Lilian and I were afraid of expressing a wish in his presence.

It was all very different now. It would cheer and comfort him by-and-by to reflect that I was able to ask a favour of him just at this crisis. Had I not been so sorely pressed as I was, it would still have been as well to ask him.

‘Ten pounds!’ he ejaculated, stopping short in his walk to gaze at me in the greatest astonishment; asking himself, I think, if *this* was the explanation of the change which he had observed in me. ‘I am utterly ashamed of my stupidity in allowing you to name such a thing; though I am sure you will do me the justice to attribute it solely to want of thought!’

‘You see I do not mind asking you, Philip.’

‘Mind indeed; of course you do not! I will run back at once and write a cheque.’

‘No; please do not—not if you have as much as ten pounds with you. Just now, I want only that.’

‘Ten pounds! Take what I have about me!’ hastily taking out his purse, and putting it into my hand.

‘But indeed I could not take all this!’ I returned, seeing that the purse contained several notes as well as gold. ‘I do not want any more than ten pounds.’

‘Nonsense; don’t make a fuss over such a trifle.’

But I separated two five-pound notes from the rest, and was very decided about his taking back the purse.

‘Then I shall of course send a cheque as soon as I get back. By the way, Mary, I am making arrangements for the settlement of three hundred a year upon you; and of course all is yours, absolutely, in the event of’—

I broke down for a few moments, leaning against the stile where we were standing.

‘Nay, Mary’—Then I think that he saw something more in my face than even the allusion to his death seemed to warrant. He went on with grave anxiety: ‘I fear you are not well. Is your hand painful?’

Ah, my hand—how thankful I was for the suggestion! I slipped it under my cloak, dragged away the bandage, which again opened the wound.

‘Bleeding afresh! You must really have it seen to, Mary.’

‘O no; it is really a very trifling affair.’ In my misery and despair, I almost laughed at the idea of being able to feel any physical pain.

He assisted me to tighten the bandage again. But I presently knew that it would not do to have his hands touching me and his face close to mine in this way; so, with a little brusque remark about his want of skill (ah Philip, had you known what it cost me!), I declared that my hand required no more fussing over. I had the parting to go through, and needed all my nerve. First, I must make sure of his not coming down to the cottage for two or three days.

‘You said you expect to be very much engaged; and therefore I suppose we shall not see you again until the end of the week—Friday or Saturday, perhaps?’

This was Tuesday, and I wanted to make sure of two clear days.

‘I will contrive to run down before that, if you wish it, Mary.’

‘No; I too have much to do. Do not come before Friday.’

‘Very well. You will tell me then which day you have decided upon, since you will not say now.’

I had waived the decision as to which day the wedding was to take place; and I did so again, merely repeating 'Friday.'

'All right; take care of yourself; and be sure to have the hand seen to.' He was stooping down to give me the customary kiss before crossing the stile; but I took his two hands in mine, and looked up into his face, I think as calmly and steadily as I had prayed for strength to do.

'God bless you, Philip.' Then I put my arms about his neck, lifted up my face to his, and kissed him. 'Good-bye, dear Philip.'

I saw an expression of surprise, a slight doubt and hesitation in his eyes. He had not found me so demonstrative as this before, and was for the moment puzzled to account for it. But I contrived to get up a smile, which I think satisfied him. Then with a last wrench, I turned away, hearing as though from another world his answering 'Good-bye' as he vaulted the stile.

After that, the rest would be easy. I allowed myself one hour in the woods—not for the indulgence of regret—I knew too well the danger of that—but for recovery, and got back to the cottage in time for our early dinner. Moreover, I forced myself to eat, knowing that I should require all the strength I could get; and delighted dear kind old Mrs Tipper's heart by asking for a glass of wine.

It was a terrible ordeal, sitting there under their tender watchful eyes; but I got through it tolerably I think. Afterwards, I told them that I wanted to catch the three o'clock up-train, adding a purposely indefinite remark about having some arrangements to make in town.

'Is Mr Dallas going to meet you, my dear?' asked Mrs Tipper anxiously.

'No; I am going on a woman's errand,' I replied, with a sad little half-smile at the thought of what their surprise would be if they could know how very literally I was speaking.

'Must you go to-day?—may not I go with you, dear Mary?' pleaded Lilian. 'You are looking so pale and unlike yourself; I do not like the idea of your going alone.'

'I should fancy that there was something really the matter with me, if I could not go alone so short a distance as that, dearie,' I lightly replied. 'I think I will allow my age to protect me.'

She drew nearer to me, looking at me in the nervous, half-afraid way she so frequently did of late, as she laid her hand upon my arm.

'I wish you would not talk like that—dear Mary, why do you?'

I was not strong enough to bear much in this way; so replied with an attempt at a jest, which made her shrink away again. I daresay my jests were flavourless enough, and in strange contrast to my looks.

Mrs Tipper's silent, anxious watchfulness was even harder to bear than Lilian's tender love. It was not my journey to town which puzzled them—I saw that they imagined I was intent upon preparing some little pleasant surprise for them at my wedding—but the change they saw in me, which no amount of diplomacy could hide.

How thankful I was, when I at length made my escape to my own room; but I was not allowed to go alone. I had to bear Lilian's loving attendance whilst I was putting on my bonnet and cloak. Indeed, she lingered by my side until I had got half-way down the lane.

'You will not be very late, Mary?'

'No, dearie; I think not—I hope not.'

'We shall be longing to see you back.'

'And you must not be surprised if I return in a very conceited frame of mind, after being made so much of,' I lightly replied.

'Only come back *yourself*,' she murmured, giving me a last kiss as she turned away.

Dear Lilian, did she in truth guess something of what the lightness cost me? I knew that I did not deceive her wholly. Although she might be in some doubt as to the cause, I did not succeed in hiding the effects from her.

I arrived at the London terminus about four o'clock, and took a cab, directing the man to drive to a West-end street facing St James's Park. My errand was to one of the largest mansions there, which at any other time I should have considered it required some nerve to approach in a way so humble. I could quite understand the cabman's hesitating inquiry as to whether I wished to be driven to the principal entrance. Probably I did not appear to him quite up to the standard of the housekeeper's room. Fortunately I was not able to give a thought to my appearance. Had I been visiting the Queen, I should have thought of her only as a fellow-woman, in my deep absorption.

Three hours later I was taken back to the railway station in a luxurious carriage, borne swiftly along by spirited horses; a slight, refined, delicate-looking woman, with earnest thoughtful eyes, and attired almost as simply as myself, was sitting by my side with my hand in hers, as we now and again touched upon the subject which occupied our thoughts.

I had found a friend in my time of need, and such a one as I had not dared to hope for. But this in due time. We parted with just a steady look and grasp of the hand.

'To-morrow?'

'Yes; between six and seven.'

I returned to the cottage, certainly not looking worse than when I had quitted it, and was received with a welcome which made me almost lose courage again. Fortunately it was very nearly our usual time for retiring. Fortunately too I had much to do, and it had to be done in the small-hours of the night, so that I had no time to give to the indulgence of my feelings when I was left alone in my room. First turning out the contents of my drawers and boxes, I separated from them a few things which were absolutely needful for my purpose. One dress and cloak and bonnet were all that I should require, besides a small supply of under-clothing. The latter I put into a small trunk which Becky could easily carry, and then replaced the other things in the drawers again, arranging and ticketing them in orderly methodical fashion as I wished them by-and-by to be distributed. If 'Tom' should in course of time prove more appreciative of Becky—which in consequence of a hint I had, received from Lydia, I did not despair of so much as she did—I pleased myself with the idea that the contents of certain drawers would make a very respectable outfit for her. The plain gray silk dress which I had purchased for my own wedding would not be too fine for hers. In a note placed on the top of the things, I begged Mrs Tipper to give them to Becky when the right time came. Afterwards I took out the little collection of my dear mother's jewellery.

It was really a much better one than I had believed it to be. Indeed I had never before examined the contents of the packet. When it appeared probable that the jewels would have to be sold, I had avoided looking at them; shrinking painfully from the idea of calculating upon the money value of my mother's only legacy to me; and perhaps also in my time of need a little afraid of being tempted by the knowledge of its worth. One diamond ring, a large single stone, which even I could tell was of some value, I put on the finger of my left hand, which would never wear another now. That was all I would keep. I then put aside a pretty ruby brooch for my dear old friend Mrs Tipper; and after some hesitation about making a little offering to Philip, I satisfied myself with selecting a valuable antique ring which had belonged to my father, and writing a line begging Lillian to give it to him with the love of his sister Mary. The rest—I was quite proud of the quantity now—I packed up and addressed to the care of Mrs Tipper—my gift to my dear Lillian on her wedding-day.

SUBMARINE CABLES.

WORKING.

THE working and maintenance of the existing telegraph lines employ a vast number of people taken all together; but it is surprising how few hands are necessary for the working of any single line or system. This is especially so in the case of submarine cables, where, when the cable continues sound, it is not necessary to support a staff for surveillance and repairs. Half-a-dozen stations several hundred miles apart, and half-a-dozen men at each, are sufficient to carry the news from one end of a continent to the other.

Without enumerating the telegraph systems that now exist, it may suffice to say that the British Isles are connected by submarine cables with nearly every quarter of the globe, and that their number is still increasing.

A telegraph station abroad, no matter in what Company or country, presents nearly the same characteristics wherever found. The more remote the place, the more primitive may be the arrangements; but the work is the same, the men are about the same, and the instruments almost invariably so. There is the superintendent; and under him the clerk in charge, his right-hand man, who oversees the clerks or operators at their work of sending and receiving messages. Then, besides these, and partly independent of them, there is the electrician, a member of the scientific as distinguished from the operating staff of the Company, whose duties are to take periodical tests of the cable and land-lines, to report on their condition, and to keep the instruments in proper working order. Under all these, there is generally the messenger and battery-man, who may be called the stoker of the electrical engine, and who, besides, does the odd work of the establishment.

The station itself generally consists of the superintendent's office or bureau; the instrument-room, where the messages are sent and received; the battery-room, generally, under ground; and the sleeping-quarters of the clerks. Occasionally the electrician and clerk in charge have separate working-rooms; and a smoking-room, with perhaps a

billiard-table and home newspapers, are added for the convenience of all. Life passes quietly and uneventfully at these stations, except when something goes wrong with the instruments or the cable, and then the electrician has his period of anxiety and trouble; while the operators, on the other hand, find their occupation at a temporary standstill.

To understand the working of a submarine cable and the actual process of sending a message, it is necessary to figure in imagination the several parts of the electric circuit, made up of the battery, the instruments, the cable, and the earth itself; and to remember that for a current of electricity to flow through any part of the circuit it is necessary that the *whole* circuit should be complete. Starting then from the battery, which is the source of the electric current, we have the cable joined to it by means of a key or sending instrument, which by the working of a short up-and-down lever can connect or disconnect the conductor of the cable to a particular pole of the battery, the other pole of the battery being the while connected to the earth. The cable then takes us to the distant station. Here the conductor is connected to the receiving instrument, or instrument for making the signals indicating the message, and through the receiving instrument it is connected to the earth. The electric circuit is thus rendered complete. The current passes from one pole of the battery by means of the key into the cable, through the cable to the instrument at the other end, and thence to the earth; and inasmuch as the other pole of the battery is at the same time connected to the earth at the first station, the conducting circuit is complete, for the earth, no matter what the intervening distance be, acts as an indispensable part of the circuit.

We have thus the two stations connected by a cable. At the station sending the message there is the battery, from which the current proceeds; the sending instrument, for letting the current into the cable, or stopping it; and the 'earth-plate,' or metal connection between one pole of the battery and the earth. At the station receiving the message there is the receiving instrument, and again the earth-plate, connecting the earth into circuit. These separate parts of the circuit, as we have already said, must be 'connected up,' as it is termed, so as to provide a complete conducting channel for the current to flow in from one pole of the battery to the distant place and back again (or virtually so) through the earth. Only at one place can the circuit be interrupted and the current consequently stopped—that is, at the key of the sending instrument. Here then the sending clerk sits, and by manipulating the lever of this key he 'makes and breaks' the circuit at will, and thereby controls the current. The regulated making and breaking of this connection is the basis of telegraphing, whether by submarine cable or by the ordinary land lines. Accordingly as the clerk maintains the circuit for a longer or a shorter time, so will the current give longer or shorter indications on the receiving instrument at the distant station: or again, according as the opposite poles of the battery are applied to the cable by the key, and the direction of the current consequently reversed in the cable, so will the indicated signals on the

receiving instrument be of opposite kind. From the elementary short and long signals, or right and left signals, so obtained on the receiving instrument, a code of letters and words may be built up, and intelligible messages transmitted. The Morse Code is that universally adopted, and for the further information of our readers we here append it as it is usually written :

Letter.	Sign.	Letter.	Sign.
A.....	— · —	P.....	— — — —
B.....	— · — · —	Q.....	— — — — ·
C.....	— · — — —	R.....	— · — —
D.....	— — — · —	S.....	— · — · —
E.....	—	T.....	— — —
F.....	— · — —	U.....	— — — —
G.....	— — — · —	V.....	— — — — ·
H.....	— · — · —	W.....	— — — — ·
I.....	— · —	X.....	— — — — ·
J.....	— · — — —	Y.....	— — — — ·
K.....	— — — —	Z.....	— — — — ·
L.....	— · — — —	Ch.....	— — — —
M.....	— — —	é (accented)	— — — —
N.....	— —	Understand	— — — —
O.....	— — —	Wait.....	— — — —

The numerals run :

Numeral.	Sign.	Numeral.	Sign.
1....	— · — — —	6....	— — — —
2....	— · — — —	7....	— — — —
3....	— · — — —	8....	— — — —
4....	— · — — —	9....	— — — —
5....	— · — — —	0....	— — — —

For other accented letters, fraction signs, punctuation, and official directions as to the disposal of the message, there are other signs, but the above are the essentials of the Morse Code. The long and short signs represent the long and short signals of the receiving instrument, produced by the long and short contacts of the sending key with the battery. It will be seen that the letter A is rendered by a short signal followed by a long one; the letter B by a long signal followed by three separate short ones; and so on. Hence, in order to telegraph the letter A to his colleague at the distant end of the line, the clerk, by depressing the lever of the sending instrument, makes contact between the cable and the battery, first for a short time, and then for a longer time. The long and short signals are widely employed in overland telegraphy; but in submarine telegraphy a saving of time is effected by signals of *opposite kind*. Thus, if a left deflection, or deflection of the indicator to the left, signifies a 'dot' or short signal, a deflection to the right will signify a 'dash' or long signal. In this case the sending instrument or key has two levers, a right and left one, corresponding to the distinct signal which each produces. By depressing the left lever of the key, a pole of the battery is applied to the cable, which produces a left-hand signal on the receiving instrument at the distant station; and by depressing the right-hand lever, a right-hand signal is produced. Proper rests or intervals are permitted between the separate words, letters, and full stops of a message.

The battery in common use for submarine telegraphy is either the sawdust Daniell or the Leclanché. The Daniell consists of a plate of zinc and a plate of copper brought into contact with each other by sawdust saturated with a solution of sulphate of zinc; and crystals of sulphate of copper (bluestone) are packed

round the copper plate, so as to dissolve there in the solution of sulphate of zinc. The zinc plate forms the *negative* pole of the battery, and the copper plate the *positive* pole. When these two poles are connected together by a wire or other conducting circuit, such as that made up of the cable and the earth, a current of electricity—the voltaic current—flows from one to the other, and always in one direction, namely, from the copper or positive pole to the zinc or *negative* pole. Hence it is that by applying the one pole or other to the cable and the other to earth through the earth-plate, the direction of the current in the cable is reversed and opposite signals produced.

The earth-plate is usually a copper plate several feet square, sunk deep into the moist subsoil near the station, so as to make a good conducting contact with the mass of the earth.

The receiving instruments for working a submarine cable are different from those used in working land-lines. Inasmuch as the current travels full strength, like a bullet, through a land-line, and in the form of an undulation or wave through a cable, so is it necessary to have different kinds of receiving instruments for each. In a land-line powerful currents can be used with impunity, and these can be made, by means of electro-magnetism, to move comparatively heavy pieces of mechanism in giving signals. But in a cable the currents are prudently kept as low as possible, in case of damage to the insulator, and the receiving instrument must therefore be delicate. In land-lines the current passes in an instant, leaving the line clear for the next signal, so that the indications of the receiving instrument are abrupt and decided. But in a cable the electric current takes an appreciable time to flow from end to end, so that the separate signals in part coalesce, the beginning of one blending with the end of that preceding it, so that the signals become involved with each other. It is necessary, therefore, that time be allowed for each wave to clear itself of the cable before another wave is sent in, otherwise we would have the cable as it were *choked* with the message. A continuous current of electricity may be said to be flowing through it, and the ripples on the surface are the separate signals of the message. It is to take cognisance of these waves or ripples that the receiving instrument for cable-work must be designed; and as the quicker the message is sent into the cable the smaller these ripples will be, the more delicate should be the instrument.

There are only two instruments in use on long cables, and both are the invention of Sir William Thomson, the distinguished Glasgow physicist and electrician. The mirror galvanometer has been already described in this *Journal* in a paper on the manufacture of submarine cables; and the 'mirror' or 'speaker,' the commonest of these receiving instruments, is but a modified form of the mirror galvanometer. It consists of a hollow coil of silk-covered wire, in the heart of which a tiny mirror, with several small magnets cemented to its back, is suspended by a single thread of floss-silk fibre. A beam of light from a lamp is thrown upon the mirror, and reflected from it on to a white screen, across which a vertical zero-line is drawn. When no current is passing through the coil, the reflected beam of

light which makes an illuminated spot or gleam on the screen, remains steady at the zero-line. But when a current passes through the coil, the magnets in its heart are moved and the mirror with them, so that the beam of light is thrown off at a different angle, and the spot of light is seen to move from the zero-line along the screen to right or to left of the zero-line according as the current is made or reversed in the coil; so that as the key is manipulated at the sending station, so are right or left signals received by the clerk who sits watching the movements of this spot of light, and interpreting them to his fellow-clerk, who writes them down. In the form of instrument here described, and also in the other receiving instrument for submarine work, the zero is not fixed but movable. The vertical line on the screen is only the nominal zero. The continuous current underlying the ripples which form the message, deflects the spot from the zero-line; but this slow deflection can be disregarded by the clerk, for over and above it there are smaller quicker movements of the spot to right and left corresponding to the ripples, and these are the proper signals of the message. It requires long practice to make a good 'mirror' clerk, one who can follow the gleam with his eye through all its quick and intricate motions, and distinguish between those due to the shifting zero and those due to the various signals sent. Even this compound-ripple difficulty, however, is now got rid of by the use of an apparatus called a 'condenser,' the effects of which are that continuous currents are neutralised, and the pulsations of the signals sent are alone seen in the movements of the light upon the scale.

The other instrument is the siphon recorder, which permanently records in ink the signals which the 'mirror' only shews transiently. The principle of the siphon recorder is the converse of that of the mirror. In the mirror there is a large fixed coil and a light suspended magnet. In the siphon recorder there is a large fixed magnet and a light suspended coil. When the current passes through this coil, the latter moves much in the same way as the magnet moves in the 'mirror'; that is, it rocks to right or left according as the current flows. This rocking motion is communicated, by a system of levers and fibres, to a very fine glass capillary siphon, which dips into an ink-bottle and draws off ink upon a strip of running paper. The ink is highly electrified, so as to rush through the siphon and out upon the paper, marking a fine line upon it as it runs. When no current passes in the coil, this zero-line is straight; but when currents are passing, the line becomes zigzag and wavy; and the right and left waves across the paper constitute the message. Both of these instruments are very beautiful and ingenious applications of well-known electric, optical, and mechanical principles. The great merit of the recorder is that if a false signal is accidentally made by the sending clerk, the whole word need not always be lost by the receiving clerk, but may be made out from the rest of the word written down. Thus much repetition of messages is saved. There is some advantage too in having a written message for purposes of after reference.

A singularly ingenious system of telegraphy, termed the *duplex*, has recently been extended to long submarine cables, and is likely to become of

general, if not universal application. It is effected by constructing an artificial line, in this case representing an artificial cable, which shall have the same influences on the current that the actual cable has. The signalling current from the battery is then split up at each station between the actual cable and the artificial cable, so that half flows into one and half into the other. And there is placed a receiving instrument in such a way between these two halves of the current that they exactly counterbalance each other's effect upon it; and so long as sending is going on from a station, the receiving instrument at that station is undisturbed. But the sending currents from the other station have the power to disturb this balance and cause signals to be made. Thus then, while the sending at a station does not affect the receiving instrument in connection with the cable there, the currents sent from the distant station cause it to mark the signals. Each station is thus enabled to send a message and receive one at the same time; and this is what is called duplex or double telegraphy.

In ordinary telegraphy, one station is receiving while the other is sending; but in duplex working, both stations are sending together and receiving together, so that there is little or no delay in the traffic, and the carrying power of a busy cable is practically doubled.

In case of accident to the cables each Company maintains a repairing-ship ready to go to sea at shortest notice. Some 'faults' are of a nature not seriously to interfere with the working of a cable; but it cannot be expected that they will remain always in the same comparatively harmless state. When a flaw occurs in the insulator it tends to enlarge itself, and more of the current escapes to the sea, until so much escapes that the current which reaches the distant station is too feeble to work the instruments there. All traffic therefore ceases. The electrician's tests having localised the fault so many miles from shore, the repairing-ship proceeds to the spot. Here she lowers her grapnel a mile or two on one side or other of the supposed line of the cable, and when enough rope has been let out, she steers very slowly under steam, or drifts with the tide across the cable's track. The grapnel is simply a great iron hook, one approved form being like a compound fish-hook, with five or six flukes starting from the shank. A weight of chain drags behind it, to keep it well down on the bottom. The rope, which is generally of wire and yarn, passes under a dynamometer, which indicates its tension, and thence to the steam winch used for hauling in. Often the grapnel catches in rocks, or mud, and gives rise to false hope of the cable having been found. The ship is brought to, and hauling in commences; but soon the obstruction 'gives,' or the grapnel itself breaks, and the true nature of the 'catch' is found out. When the cable is hooked, the greatest skill and care are needed, especially when the ship's head lifts with the waves, to bring up the bight carefully without breaking the cable. When brought to the surface the cable is cut, and each end is brought on board in turn and tested. The fault, as we have previously shewn with the paying-out ship, may prove to be but a few miles distant. The sound end is thereupon buoyed, and the ship proceeds to pick up or haul in the faulty end until it is

thought the fault must have been picked up. The electrician then cuts off the piece which contains the fault, and then he has only to join on a sound piece of cable in its place, and lay it back to the end that was buoyed, so filling up the gap. But if it should *not* contain the fault, the tests are again applied, until finally the fault is detected and cut out. Repairing is arduous and trying work; now giving rise to hopes, now crushing them, and anon deferring them. A great responsibility rests on those who undertake them, as the gain or loss of a week or two may represent an enormous sum of money to the Company.

CROSS-PURPOSES.

IN TWO CHAPTERS.—CHAPTER II.

HAD Cissy only known it, there was very little in Frank Halkett's words to cause her any uneasiness. On his entering the drawing-room, seeing his place by Cissy's side forestalled by the major, whose person intercepted the beaming smile of welcome she bestowed upon him, he had turned away and thrown himself into the low chair that stood by Mrs Leyton's cosy lounge.

'So you have taken refuge with me,' says that lady with a quiet smile.

'Refuge!' repeats Halkett with an innocently puzzled air. 'No; I have only taken a seat.'

'What's the matter with you, Frank?'

'Nothing. Why? Do I look dyspeptic?'

'You don't look pleasant, certainly, if that has anything to do with it. Come; I am a witch, you know,' says Mrs Leyton, 'and so can tell all your secrets. And just to prove my power, I will tell you something now—you are sulky this evening.'

'Meaning I am stupid, I suppose,' says Halkett; 'but it don't take much witchery to discover that. I have an awful headache.'

'Oh, but I have not half done yet,' exclaims Mrs Leyton. 'Shall I go on? I could tell something very important, but that I am afraid of your heavy displeasure. Will you promise not to be angry?'

'Angry with *you*! Was I ever that?' asks Halkett tenderly. 'I give you full liberty to say anything on earth you like to me.'

'Do you mean that?'

'Certainly I mean it.'

'Very good then,' says the widow with lazy triumph; 'I will continue my sorceries; and first—you are in love.'

'In love!' reiterates Halkett, forcing himself heroically to meet her laughing eyes, and reddening very much in the attempt. 'No, no; your witchcraft has played you false this time.'

'It has not. I persist in my declaration. You are in love—hopelessly, irretrievably, desperately in love.'

'Well, perhaps I am,' says Frank, with tranquil resignation. 'Is that strange? Could one be with you, Frances, for so long a time, and not'—

'Nonsense!' interrupts Mrs Leyton. 'Do not trouble yourself to complete that sentence. We are much too old friends for *that*, I take it. And now, Frank, be a good boy; emulate your name, tell me all about it.'

'I really don't know that there is anything much to tell,' says Halkett, smiling. 'But what there is you shall hear. I admire a certain young lady

more than is good for me; I fancy, until to-day, she returns my regard. I discover a couple of hours ago that my vanity has misled me. I see her happy in the arms—no, in the society of another—I find myself nowhere, hence my dyspepsia, distraction, and despair.—Don't look so sympathetic, Frances; probably I shall get over it.'

Though he says this with a laughing face, Mrs Leyton's dark eyes can see for themselves he is tremendously hard hit.

'And what is her name?' she asks sweetly.

'O Frances! You laying claim to be a witch, and must even ask *that* question? I decline to answer it. Your fairy lore should enable you to find out that much for yourself.'

'I love my love with a C because she is candid; I hate her with a C because she is capricious,' says Mrs Leyton archly. 'Am I "warm?" or will you still cry "cold?" If you do the latter, I doubt you will be wronging your conscience. Ah, Frank, I think I am one too many for you!'

'You were always that. What one man is equal to any woman? Well, as you have guessed so far, I believe I may as well tell you the rest;' and forthwith he commences to pour forth a tale, the telling of which had caused Cissy such exquisite anguish.

When he has finished, Mrs Leyton says: 'If you will take my advice, you will seek the first opportunity that offers, and ask for an explanation of her coldness.'

'You really think that the best thing to do?' says Halkett, brightening. 'I will act upon your advice then, and try my chance. Now let us forget it for the present. Is that a new ring upon your finger? May I look at it? Does it mark a fresh adorer?'

'No; an old one. Geoffrey Hyde gave it to me last autumn.' She surrenders her hand to him as she speaks; and he bending over it, examines leisurely the cluster of brilliants that scintillate and flash beneath the lamp-light.

'He has been faithful to you for a long time,' says Halkett presently.

'Yes; he is very tormenting. I really believe I shall have to marry him in the long-run, if only to get him out of the way.' She reddens a little as she says this, and laughs rather nervously.

'Are you serious?' asks Halkett with surprise. 'Then you are going to make him a happy man after all?'

'That remains to be proved. Probably I shall make him a wholesome warning to all obstinate men. But I think when last I saw him I made him some foolish promise about marrying him in the spring.'

'I congratulate him with all my heart, and you too,' says Halkett cordially. 'I think he's the only man I know *quite* worthy of you.'

When the hour comes for bedroom candles to be adjusted, Halkett seizes one, lights it, and carries it solemnly to Miss Mordant. But quick as he has been, Major Blake reaches her side similarly armed, almost at the same moment.

'Which shall I take?' says Miss Cissy gaily. 'I suppose I can have my choice. I think *this* pleases me most;' and she holds out her hand towards Blake with a pretty smile. 'Thank you,' she continues, slipping her slender fingers into his brown palm; 'and good-night. Don't smoke too much;' and with a little provoking backward nod

she trips away, without bestowing so much as one poor glance upon Halkett. And so ends his first attempt at an explanation, leaving him so indignant that he almost vows he will not seek another.

All the following day Miss Mordaunt studiously avoids him, giving him no chance of obtaining the tête-à-tête she sees is impending. But Halkett calmly bides his time, knowing it cannot be far distant. As daylight fades, he feels more than ever determined to bring her to book before the dawn of another morning; and in this instance at least the Fates favour him, as there is to be a large dancing-party at the Hall to-night. She cannot well refuse to give him one dance out of the many—such palpable avoidance would be rather too marked; and once he has secured her as his partner, she must be at his mercy until the dance comes to an end.

This idea of course has also occurred to Miss Mordaunt, and though dreading the interview, she is still sufficiently indignant to cause her to make up her mind to be as curt and outspoken on the occasion as will be in strict keeping with her dignity. In this frame of mind she goes up-stairs to dress, and being an Irishwoman, it cannot be altogether said but that she sustains a rather pleasurable sensation—albeit one largely mingled with something very much akin to nervousness—as the battle-hour draws nigh.

'What shall I wear, Kennedy?' she asks her maid, sinking languidly into a chair.

'Well, miss, you know you look well in anything,' says Kennedy obligingly; 'there is nothing but what becomes you; but if I might be allowed to suggest, you look lovely entirely in white.'

'I won't wear white; I hate it,' says her mistress pettishly. 'Débutantes, and brides, and corpses wear white; I think—I shall wear—black to-night.'

'Black? O Miss Mordaunt!'

'Yes; certainly. Is gay clothing so necessary to me, then?'

'Well, miss, there's no doubt but you look real handsome in black; but the other ladies—they will be so gay—and you'—

'I shall be gayer than any of them, and the greater contrast!' cries Cissy, springing to her feet.

'Come, Kennedy; despatch, despatch; I feel I shall hold my own yet.'

And Kennedy throwing herself heart and mind into her task, soon turns out the most charming picture possible.

As Miss Mordaunt enters the drawing-room she sees Halkett standing on the hearth-rug in earnest conversation with the widow, who, if there is a fire anywhere, is never any great distance from it. He has been telling her of his repulse of the night before, and is looking somewhat dejected.

'Never mind,' says Mrs Leyton kindly; 'get her alone; then you will have the advantage. I think she must have heard—or fancied—something that wounds her.'

'I do not flatter myself so far; I merely think she prefers Blake, and wishes to get rid of me,' says Halkett gloomily.

'Nonsense! Let nothing induce you to believe that. In the first place, she doesn't even look at the man in the right way.'

Halkett laughs in spite of himself, and immediately afterwards becomes if possible even more despondent than before.

'How can she like that fellow Blake?' he says ill-naturedly.

'Oh, I don't see that. For my part, I think him absolutely handsome.'

'Of course, that goes without telling. All women have a *tendresse* for those great coarse broad-shouldered men. And what an accent he has!'

'Do you really dislike it? To me, I confess it is rather pleasant; mellow, with just a touch of the brogue. Your Cissy, you must remember, has it too, with perhaps rather more of the mellow and less of the brogue; but then you are prejudiced against this poor Blake.'

'Indeed I am not; you mistake me altogether: I think him a downright good fellow. In fact I have a fancy for all Irishmen; they are so full of go—chic—good-humour, until crossed. And Blake is like all his countrymen, a most enjoyable companion,' says Halkett with suspicious warmth.

'Evidently Miss Mordaunt is of your opinion,' says the widow rather cruelly, pointing to where Cissy is listening with a smiling face to one of the major's good stories.

Meanwhile the guests are arriving; and the fine old room that has been given up to the dancers is rapidly filling with pretty girls and powdered dowagers and men of all ages and degrees. Papas too are numerous; but these instinctively crowd round Uncle Charlie, and by degrees edge towards a more dimly lighted room, where instinct tells them, whilst is holding silent sway.

'Will you give me the first dance?' says Halkett to Mrs Leyton, who readily grants her consent. Major Blake has of course secured Cissy; and presently, as ill-luck will have it, they find themselves in the same set, dancing opposite to each other. As Halkett's hand meets Cissy's, he hardly lets his fingers close round hers; and as she is also in a revengeful mood, the ladies' chain almost falls to the ground. Mrs Leyton, in spite of the good-nature that lies somewhere in her composition, nearly chokes with suppressed laughter as she witnesses this little by-play. She twits Halkett about it later on, but he is moody, and doesn't take kindly to her witticisms.

At least half the programme has been gone through before Captain Halkett asks Miss Mordaunt for the pleasure of a dance.

'If I am disengaged,' she says coldly, not looking at him, and searches her card with a languid bored air that tantalises him almost beyond endurance. He is longing to say: 'Never mind it; I won't interfere with your enjoyment this time,' with his sweetest smile, and rage at his heart; but he is too sternly determined to have it out with her to-night, to let his natural feelings win the day.

Cissy examining her card finds she is not engaged for the next dance, very much to her disgust; and is pondering whether she shall tell the lie direct and declare she is, when Halkett, as though he divines her thoughts, says abruptly: 'Not engaged for the next? Then I suppose I may have it?'

'I suppose so,' returns Miss Cissy reluctantly; and instantly turning from him, addresses her partner, as though such a person as Halkett were no longer in existence. Indeed, when after a quarter of an hour, he finds her in the conservatory and claims the fulfilment of her promise, it is with the utmost bad grace she places the very tips of

her fingers upon his arm, and looks impatiently towards the ball-room.

'I don't mean dancing just yet; I have something particular to say to you first,' says Halkett hastily, and almost commandingly, standing quite still. 'It is hardly private here. Would you find it too cold to come with me into the garden?' glancing at the open door of the conservatory.

Cissy hesitates; then fearful of seeming reluctant, says: 'No. If you will go to the library for my shawl (you will find it on the sofa), I will go with you.'

'You will stay here until I return?' says Halkett, regarding her intently.

Cissy stares in turn. 'Of course I will,' she answers rather haughtily, and he goes.

'Did he imagine I would run away when his back was turned?' she soliloquises angrily. 'Does he suppose I am afraid? One would think it was I was in the wrong, not he. His conduct altogether is downright mysterious. I cannot understand him; and for the first time it dawns upon her mind that there may possibly be some flaw in the interpretation she has put upon his conduct.'

Returning with the shawl, Halkett places it gently round her shoulders, and they pass into the quiet night.

'What a beautiful moon!' exclaims Cissy presently, hardly knowing what to say.

'Yes,' absently.

'And for this time of year, how wonderfully mild it is—not in the least cold—as one might expect.'

'Yes—no—is it not?'

'I really don't know what you think about it,' says Miss Mordaunt impatiently. 'I for my part find it almost warm; but of course I cannot answer for you. Probably all this time you are feeling desperately cold.'

This little petulant outburst rouses Halkett.

'No!' he says with sudden energy and warmth; 'I am not. It is not in my nature to be cold in any way. I feel most things keenly: more especially slights from those I love. All ill-concealed disdain, unkind speeches, fickleness, touch me closely.'

'I can sympathise with you,' says Cissy calmly. 'I think nothing can be so bad as inconstancy—except perhaps deceit.'

This retort being as unexpected as it is evidently meant, puzzles Halkett to such a degree that he becomes absolutely silent. Miss Mordaunt, with her white shawl drawn closely round her slight black-robed figure, walks quietly beside him with the air of an offended queen, her head held rather higher than usual, a pretty look of scorn upon her lips.

After a while Halkett pulls up abruptly and faces her in the narrow pathway. 'What is the reason of your changed behaviour towards me to-day and yesterday?' he says shortly. 'I think I have a right to ask that.'

'Have I changed?'

'Have you? Must you ask the question? The whole world can see it. You treat me with the most studied coldness.'

'I thought I was treating you with as much courtesy as I give to all my uncle's guests.'

'I don't care for courtesy,' says Halkett passionately; 'your hatred would be better than your indifference. Yesterday morning I believed we were

friends—nay, more than that; yesterday evening you ignored me altogether. It is either heartless coquetry on your part, or else you have a reason for your conduct. Let me hear it.'

'You are forgetting yourself,' says Miss Mordaunt coldly. 'You are the first person who has ever accused me of coquetry; you shall not do it again. I was foolish to come here with you, but—I trusted you. I wish to return to the house.'

'Nay, hear me!' cries Halkett remorsefully, following as she makes a movement to leave him, and catching her hand to detain her. 'Your avoidance has so perplexed and maddened me, that I said more than I meant or intended. Forgive me, and at least let me know how I have offended. Cissy, answer me!'

For a moment Miss Mordaunt hesitates, then endeavouring to speak lightly: 'I did not intend to perplex you,' she says; 'one cannot speak to every one at the same time. I am sorry if I appeared rude or neglectful; but you did not look very miserable, and surely Mrs Leyton was an excellent substitute for me.' She smiles as she says this, but pales a little too beneath the brilliant moon that is betraying her.

'Mrs Leyton is my very oldest and dearest friend,' replies Halkett; 'but no one on earth could console me for—your loss. Why will you not confess the truth, Cissy, and'—

'Yet you once loved her, if report speaks truly,' interrupts Miss Mordaunt, still speaking carelessly, though her heart-throbs can almost be counted. 'In India, we hear, there was a time when you would gladly have called her your wife. Is it not so?'

Halkett drops her hand.

'Has that miserable bit of gossip taken root even here?' he says with a faint sneer. 'Has Blake been making his cause good by such rubbishing tales? Frances Leyton and I grew up together. I would as soon think of making love to my nearest of kin as to her. The idea of any romantic attachment existing between us is more than absurd! Besides, she is to be married to Geoffrey Hyde early in the coming spring.'

Miss Mordaunt severs a little twig from one of the shrubs, and takes it to pieces slowly.

'Then she did not give you your favourite mare?' she says quietly, detesting herself as she asks the question, yet feeling compelled to solve all her doubts at once.

'No; she did not.' A pause. 'Shall I tell you who gave her to me? It was my only sister, Lady Harley. She loved the Baby dearly, and on her death-bed, told me to take good care of the creature, for her sake.'

The twig falls from Cissy's fingers. Surely, surely it cannot be true! Oh, how he must hate and despise her for all she has said and done! It is too late now to make reparation. She feels she would rather die a thousand deaths than give in, and confess to all the wretched suspicions and jealousies she has been carefully harbouring in her heart during these two past days.

'However, all this is beside the question,' goes on Halkett; 'you have not yet told me what I so much want to know. Has Blake anything to do with your coldness to me? Tell me, Cissy, are you engaged to him?'

Cissy has not expected this, and growing

suddenly crimson, lets her head droop somewhat suspiciously. Halkett's eyes are on her face.

'No; of course not—I am not indeed,' There is a faint stammer in her speech as she says this, and Halkett's fears become certainties.

'But you care for him!' he exclaims vehemently. 'The very mention of his name has brought a flush into your cheeks. You hesitate, and turn your head aside. This then accounts for your sudden change of behaviour towards me! Having gained your point, you found your first victim in the way, and hardly knowing how to get rid of so troublesome an appendage, had recourse to—— Had you told me point-blank my attentions were unwelcome, it would have been more womanly, more just'——

'Pray, do not say another word,' says Miss Mordaunt with dignity, though tears are in her voice and eyes; 'this is the second time to-night you have spoken words difficult to forget. Do not trouble yourself to return with me. I prefer going in alone.'

When Cissy and Halkett appear at breakfast the following morning, they take care to seat themselves as far as possible from each other, and presently it becomes palpable to every one that they are considerably out of sorts. Uncle Charlie suggests that Miss Cissy has over-danced herself, or given the wrong man his *congé*; a remark that has sufficient truth in it to bring the hot blood into her cheeks. While Captain Halkett, having run through his letters, declares he must return to town by the afternoon train; at which Mrs Leyton looks uneasy, and casts a covert glance at Cissy Mordaunt.

That young lady stands fire pretty well, but with all her hardihood cannot keep her under lip from trembling ever so little. This sign of weakness be assured does not escape the widow's tutored eye; and she instantly challenges Major Blake to a game of billiards after breakfast.

'My dear Frank, you can't go to-day,' says Uncle Charlie decidedly. 'To-morrow they have promised us the best run we have had yet. I will not hear of your leaving. Write and tell her you have sprained your ankle, and send her your undying love. She will forgive you when she sees you.'

'I wish I *could* stay,' says Halkett, laughing; 'but unfortunately my recall is from my solicitor, not from my lady-love.'

'I don't believe a word of it!' says Uncle Charlie. 'A sudden recall *always* means a woman. Why, when I was a young man, I thought nothing of'——

'My dear!' says Aunt Isabel, with a gentle uplifting of the right hand.

'Quite so, my good Belle,' returns Uncle Charlie, patting the soft white fingers. 'But seriously, Frank, she will do very well without you.'

'I have no doubt of that,' says Halkett, and raising his eyes meets Miss Mordaunt's full.

Half an hour later, Cissy, feeling mournful and guilty, steals round to the stables to take a last look at the Baby, as she is afraid to look at the Baby's master. Just as she is patting her and rubbing down the soft velvet muzzle, the door opens, and Halkett enters.

'I am glad to see she is so much better,' says Miss Mordaunt promptly but nervously, pointing

to the injured limb. 'If you go to-day, you will not take her with you, I suppose?'

'No; I suppose not.'

'Must you go?'

Halkett glances at her reproachfully. 'Yes; of course I must. There is no other course left open to me. After what you told me last night, it would be simple madness to remain.'

'What did I tell you? I don't think I told you anything.'

'Well—what you led me to infer.'

'You should not infer things. I never meant you to do so.' As Miss Mordaunt says this in a very low tone, she turns her head aside and recedes a step or two. A dark flush rises to Halkett's brow, colouring all his face, even through the bronze an Indian sun has laid upon it. A sudden gleam of something akin to hope shines in his eyes for an instant, but as speedily suppressed.

'Do you know what you are doing?' he says in a tone sufficiently unsteady to betray the agitation he is feeling. 'Do you know what your manner, your words seem to me to mean? Do not, I implore you, raise within me again the hope I have surrendered, unless—— O Cissy, you will never know how cruel a thing it is to love without return!'

'But—are you sure—your love—has gained no return?' demands Miss Cissy in faltering accents, and immediately afterwards feels she has but one desire on earth, and that is for the ground to open and swallow her.

'Cissy, Cissy!' cries Halkett, 'tell me you do not care for that fellow Blake!'

'Not a bit, not a bit!' says Cissy; and in another moment finds herself in Halkett's arms, her tears running riot over the breast of his coat. 'Oh, say that you forgive me!' she sobs. 'It was most hateful of me—about that bedroom candlestick the other night, and everything. But I misunderstood it all. I thought you loved Mrs Leyton. Say that you forgive me!'

'I will not hear a word about forgiveness now,' says Halkett, who has been assiduously employed in kissing her hair, brow, and any other part of her face that is visible. 'It is taking a mean advantage of me; I am so happy this moment, I would forgive my bitterest enemy without hesitation. By-and-by we will discuss the question, and I shall grant you pardon on my own terms.'

Some time before luncheon there comes a knock, low but decided, at Uncle Charlie's library door.

'Come in!' calls out the owner of the apartment; and the door opening admits Frank Halkett and Miss Mordaunt—the latter keeping well behind, and only compelled by the strong clasp of her companion's hand to advance at all.

'I have come, sir,' says Halkett mildly, 'to tell you I have, after all, decided on delaying my departure until next week, as I at first intended—if you do not object.'

'Indeed, indeed; I am glad of that,' says Uncle Charlie, just a wee bit puzzled. 'I need not say how welcome you are.—But what about the business letter, eh, and your hot haste to reach town? What has changed your plans, eh?'

'Miss Mordaunt,' says Halkett, with a mischievous glance at Cissy, who is hopelessly confused and horribly shamefaced, in the background. 'Miss Mordaunt has induced me to alter my mind.'

'Eh! what, what?' says Uncle Charlie, rising from his chair as the truth dawns upon him, and instantly sinking back into it again. 'You don't mean it! And all this time I could have sworn it was that fellow Blake!'

And so were made happy a pair who, through a mutual misunderstanding, might have never come together again in this world; who, but for an accidental timely explanation, might have remained through life victims to Cross-purposes. Reader, remember that there are two sides to every story.

POLAR COLONISATION.

TOWARDS the end of February the Naval Committee of the House of Representatives at Washington reported a Bill authorising the American government to fit out an Arctic Expedition, which would establish a colony on Lady Franklin's Bay, and thence despatch exploring parties to the Pole. To influence congressional action in this matter, two or three pamphlets have been put forth in America, and circulated among the members of both houses. In one of these, Captain Henry W. Howgate, U.S.A., advocates the doctrine, that to reach the Pole with the greatest certainty, and with the least expenditure of time, money, and human life, it is essential that the exploring party be on the ground at the very time when the ice gives way and opens the gateway to the long-sought prize. This, he affirms, can only be done by colonising a few hardy, resolute, and experienced men at some point near the borders of the Polar Sea.

The same idea, in a somewhat different form, is advocated by Mr R. W. D. Bryan, of the United States' Naval Observatory at Washington, who, at Captain Howgate's request, has expounded in a brief pamphlet his views in regard to the best methods of conducting Arctic exploration. Mr Bryan says that he has given the subject much thought for many years, and has carefully examined the rich treasures of Arctic literature. This study, and his own experience and personal observation during the *Polaris* expedition, have suggested to him a plan which seems comprehensive and practicable. He is opposed to all spasmodic efforts to reach the Pole, because the chances of success are not commensurate with the necessary outlay. Let a vessel, he says, be always ready at some advanced post to push forward whenever an opportunity offers, for it is well known to Arctic explorers that Polar ice moves, shifts its position, and breaks up, sometimes slowly, and at other times with great rapidity, and that its position and condition change from year to year; hence in the same place success in one season may follow the defeat of a previous one. If, therefore, a vessel be at hand when the movement carries the ice out of her path, she can advance; and if, unfortunately, she should have no such opportunity, her officers and crew, by their observations and their boat and sledge journeys, would be able to employ their time profitably; the chances, however, would probably be in favour of their finding some season sufficiently open to admit of their forcing the vessel towards the Pole. In connection

with the ship which is thus to watch year by year for a friendly ice movement, Mr Bryan would have a station established on the land within easy communicating distance, and yet not so far north as to prevent its being visited at least once in every two or three years by a ship from the parent country. The plan, no doubt, is one which would conduce to eventual success; but we should fancy that even the hardiest enthusiasts would shrink from an undertaking which would involve their spending annually from four to five months in total darkness, even though 'the station should afford warm comfortable quarters for a corps of scientific observers and an active band of explorers.'

We cannot follow Mr Bryan through all the details of his original plan, but it will be interesting to glance briefly at a bolder and more comprehensive one which he develops towards the conclusion of his *brochure*. He says, and with reason, that a greater certainty of speedy success and the collection of scientific data beyond all measure more valuable, would follow the enlargement of the scheme he has propounded. 'Instead of establishing one station, and having but one ship watching tirelessly the mysterious movements of the ice, let there be many stations and many ships placed at intervals along the whole threshold of the unknown region.' To this, of course, the obvious objection arises that the plan would involve the expenditure of a large amount of money; but Mr Bryan is equal to the occasion, and perhaps taking a hint from the king of the Belgians' proposition with regard to African exploration, he suggests that the enterprise should be an international one, for in that case the burden upon any one nation would be comparatively light. Mr Bryan has gone further, for he has partitioned the work among the nations. Great Britain is to grapple with the difficulties of the Behring Strait route, and in addition, to take a turn at 'the eastern coast of Wrangell's Land or the western coast, or both.' This, we imagine, would keep Sir George Nares occupied for some time. For the United States is claimed the right to consider the Smith's Sound route as peculiarly its own; and the Germans are to undertake 'the eastern coast of Greenland, the route advocated so long and so well by their illustrious geographer Dr Petermann.' The Dutch are to take Spitzbergen for the base of their operations; the Austrians are to follow up Lieutenant Payer's discoveries in Franz Josef Land; and the Russians are to establish stations upon Novaya Zemlya and some of the extreme northern points of their empire. Italy, Norway, and Sweden, France, Spain, and Portugal have minor parts assigned to them; but hardy Denmark, oddly enough, is overlooked.

Mr Bryan thinks that the money laid out on these enterprises would be 'well invested, and would give an ample and speedy return in every department of human industry.'

Since the foregoing was written, intelligence has been received that arrangements are actually in progress for carrying out Captain Howgate's bold plan of prosecuting Polar discovery. The expedition, we hear, will be under the command of Captain Tyson, of *Polaris* fame, and it was intended that it should leave at once for the Arctic regions to select a position for the planting of a colony in 1878. The funds required for this advance voyage (about ten thousand dollars) will be raised by

subscription in New York; and it is expected that Congress will in autumn appropriate fifty thousand dollars to cover the expenses of despatching the colony.

A FEW WORDS ABOUT POULTRY.

THERE is no species of live-stock less understood or less cared for than poultry. Almost every farmer and nearly every cottager in the country keeps hens, as well as a great number of people about the suburbs of all large towns; and strange as it may seem, if you ask them as to the profitability of their stock, you will almost invariably be met with the answer that 'hens don't pay.' Many people of course never take the trouble to find out whether they pay or not, but go on rehearsing the story of others who do take that trouble, and who find it an unprofitable job. With a large number of poultry-keepers this is really the case; and there must therefore be a certain fascination about fowls that induces such people to keep them. The secret probably is that fresh eggs being such an adjunct to the breakfast-table and to the making of savoury omelets and puddings, hens are kept to lay eggs, no matter how few, or at what cost. Some people, however, do make them pay, and pay well too; but it is only by properly directed intelligence being brought to bear on the subject, as well as by the exercise of a good deal of care and attention, that this object is attained. Many an amateur keeper of poultry is able during the spring months to sell as many eggs as he can part with at prices ranging from six shillings to a guinea per dozen—such eggs being the produce of prize poultry, and such prices being given in order to rear chickens from them. It is therefore principally amateurs, fanciers, and people who take delight in and bestow care and attention on their birds, that are able to reap satisfactory results from the rearing and keeping of poultry. If care and attention were not brought to bear on the rearing of horses and cattle, these would not pay either; but hens are, by farmers especially, usually considered too insignificant to bestow much trouble on; therefore they are often allowed to run about starved and ill cared for at one time, and glutted with food at another; while their roosting-houses from want of cleaning become so filthy that it is a wonder the birds so frequently escape the diseases which filth engenders, and to which the feathered tribe are so liable.

It is certainly not creditable to this country that the importation of poultry and eggs is so enormous, and probably few persons are aware of its extent. In 1875, the latest year for which the Board of Trade returns have been completed, no less than seven hundred and forty-one million of eggs were brought into this country; and the returns of the immediately preceding years shew that this importation has been making gigantic strides. Most of these eggs come to us from France; and when we consider that the French themselves are large consumers of both eggs and poultry, it may well be imagined to what an enormous extent our friends across the Channel develop this branch of trade or commerce. The advantage which our continental neighbours derive from it is obvious when we consider that not only eggs but fowls are largely sent over to us; and that about three millions of pounds sterling are now annually paid

by Great Britain for these two staple articles of consumption. Farmers and poultry-keepers should lay this well to heart, and endeavour by some means so to increase the production of poultry and eggs, as not only to secure the retention of a large portion of this money in our own country, but to fill their own pockets with a portion of it.

In our observation and experience the point on which most ignorance prevails with regard to poultry is food. No attention or intelligence appears to be directed to the kind, quantity, or time of feeding that is most suitable; and nowhere is this ignorance more noticeable than at farm-steadings. At such places, hens are generally allowed to surfeit themselves with grain at one season, while they are starved at another. Now they do not lay well while they are either in the one condition or the other; for a starved bird has not the wherewithal to produce eggs, while an over-fed one gets lazy and accumulates internal fat, to the extinction of egg-production altogether. Hens never lay so well as when they are kept in a state of activity, running after meat that is thrown to them, or searching and scratching for it among earth or rubbish. After moulting-time, or when hens have been as it were resting from laying eggs, one of the first things that to a keen observer heralds a speedy return to that state, is the restless activity with which they scrape and scratch the ground. When their courts or haunts bear evidence of this by the holes which they make, laying is not far off. A happy medium in feeding produces the best results with poultry; and a golden rule is never to give fowls more at a time than they will greedily pick up. Indeed they should always be made to leave off before their appetite is satiated. Their meals should be given regularly, and should be thrown on the ground to them, not left in wooden troughs, which readily sour and taint the meat. But whether given on the ground or otherwise, not a particle should be allowed to lie over, for nothing injures hens more than stale food.

The number of meals in a day may vary according to circumstances, but for adult fowls no more than three should ever be allowed. Where hens have full liberty to roam about a farm-yard or in fields, only two scanty meals should be given both in summer and in winter—one in the morning as early as possible, and the other about an hour before they go to roost in the evening. Birds which are confined to courts or runs should have a more substantial meal—not later than nine o'clock in the morning in winter, and an hour or two earlier in summer, with a pick of something at mid-day, besides their evening feed. Grain of some kind should always be given them at night; wheat, rough barley, or oats, are all good, but ought to be used singly, not mixed; and it is well occasionally to change the variety. Indian corn seems to be more relished than any other grain, but should be sparingly given, and never longer than a very few days at a time, just for a change, as it has a very fattening tendency. The morning meal may consist of table-refuse of any sort mixed to a proper consistency with sharps, middlings, bran, or barley-meal. The mixture should neither be too sloppy nor too hard, but such as if thrown on the ground in a lump will break into bits, not crumble down into a state of powder. Potatoes are bad to use in large quantities, for like Indian corn

they are too fattening; boiled turnips, however, may be used with advantage for mixing. In winter it is best to give the morning diet warm, with an occasional sprinkling of pepper during very cold or wet weather. A very little salt may likewise be added. The mid-day pick may either consist of the morning's remains or a little grain; but on no account should soft food be given after it has stood for any length of time. It can be mixed up at night, but what is then prepared should all be used up on the following day. Grass or green food of some kind is requisite to keep poultry in good condition; and if the birds have not free access to it, a little cut up and mixed with their food, or a cabbage or lettuce hung up with a string just within reach of the birds, so that they may get at it with a little trouble, is a very valuable accessory to the dictary. It is absolutely necessary that green food be given regularly, if fowls are expected to thrive; but the amount of it need not be great; only if it is left off for a time and then resorted to, or given in too large quantities, it is likely to cause diarrhoea.

It is very difficult to define the exact quantity of food that ought to be given to hens, and it is well to remember that at some seasons they will eat much more than at others; but as a general rule for those in confinement, a ball about the size of a duck's egg in the morning, half of that at mid-day, and an average-sized handful of grain at night, is about the proper quantity for each bird; and less than that of course for those that have fields or farm-yards to roam in. The tendency with most poultry-keepers is to feed too well, and it is generally very difficult to get them convinced of this, for hens will go on eating long after they have had enough; but the consequences are always bad, such as accumulation of internal fat and the laying of soft or shell-less eggs. This latter disease—for so it may be called—is a very common effect of over-feeding young hens, and is sometimes not observed till it has existed for some time, as such eggs are often eaten by the birds as soon as laid, and if they are not caught in the act, those who keep them may be none the wiser. The quickest and most effectual way to cure the effects of over-feeding is to administer a good dose of Epsom salts in their soft food in the morning, and to starve them till the following day. Indeed such treatment to overfed fowls that have gone off laying will often bring them into that condition again at once. Poultry should always have access to plenty of cool fresh water; and if the dish containing it cannot be kept in a cool or shady place, the water should be frequently renewed, especially in warm sunny weather, for nothing is worse for hens than sun-warmed water. It is also important that a handful or two of small stones or gravel be occasionally thrown into their runs, if the ground itself is not gravelly, for hens swallow such stones to assist the gizzard in triturating their food. It is considered that lime or old mortar is necessary for the production of egg-shell, but we cannot speak authoritatively on this point, for we have kept hens for years, and never yet saw them swallow a piece of mortar, although they have access to it; but we are bound to admit that oyster-shells, broken up small, are at certain times swallowed with great avidity, if fowls can obtain them.

Next to the importance of good systematic feed-

ing, if not even before it, ought to come cleanliness. Some people never think of cleaning their hen-houses and hen-runs; but it ought to be carefully and regularly done; and the inside walls and roosting-bars should be whitewashed at least twice every year. In connection with this, it may be mentioned that nothing is worse for a hen-house than a wooden floor, as it soon gets saturated with their droppings, and becomes rotten, when it is impossible to clean it. A stone or cement floor, or even an earthen one, is greatly superior to one made of wood; and if such a floor be kept thickly strewn with fine coal-ashes, sand, or dry earth, this helps to deodorise the dung, and is easily cleaned—besides the whole makes a very valuable manure, which can be used in the garden. The floor or ground of the court or run should be earth, the surface of which can be lifted off occasionally with a spade, and then dug up to freshen it. At such times, the birds will get a feed of worms, which will do them much good.

Fowls clean themselves by means of dust; and if they have not access to it, they readily become infested with a species of small lice. Finely riddled coal-ash or dry earth laid in a sheltered corner of their run will answer the purpose. It should be renewed occasionally, and a little flowers of sulphur or carbolic powder sprinkled on it. It is very amusing to see the birds lying in their baths and shaking the dust all over and through their feathers. They seem to take great delight in this occupation.

The variety to be kept depends on circumstances, that which suits one locality being unsuitable in another. Many people keep what are called barn-door fowls, that is, a cross of all sorts of breeds, but experience shews that such fowls are not profitable either for the table or for laying. Occasionally one hears that there is nothing like them for laying; but those who speak thus have seldom much experience of pure breeds; and because they now and again find cross-bred birds laying remarkably well, they are too apt to sound their praise. A first cross between two pure breeds, such as the 'Dorking' and 'Spanish,' or 'Game' and 'Spanish,' sometimes produces very fine profitable fowls; but if these are again allowed to mate with other crosses, the progeny always degenerates. The Dorking is perhaps the most common and well-known variety in this country, and holds a good reputation for size and quality as a table bird, also for its laying powers. It does not thrive, however, in all localities, requiring a dry soil and extensive range to roam on, and is essentially a farmer's bird. Dorkings make good sitters and mothers. The variety is bred to perfection, principally in the counties of Sussex and Surrey. The general favourites of 'fanciers,' owing to their symmetry of form and beautiful plumage, are the several varieties of Game; but they are somewhat troublesome to keep, owing to their fighting proclivities. Spanish hens are good layers of large eggs, but the breed is a delicate one, difficult to rear, and difficult to keep in health. Cold and damp affect them much; but they sometimes do well in confined runs, if these are dry and sheltered and their houses warm. 'Brahmas' and 'Cochins,' two Asiatic breeds, created quite a sensation on their first being brought to this country about a quarter of a century ago, and large prices were then paid for them. As chickens they take a long

time to grow, but ultimately attain great size. They are both good layers, especially in winter, when eggs are dear, but are inveterate sitters; and the time lost by this propensity often neutralises the profit which might be made from their egg-producing qualities. 'Hamburgs' lay numerous eggs of a rather small description. The French varieties have been gaining ground in this country for some years back, the 'Houdans' being splendid table fowls, with good white flesh and small bones. They grow very fast as chickens, but do not generally begin to lay till well matured. 'Crève-cœurs' also grow quickly to a good size, but have not much reputation as layers. The latest breed—which, however, has not been known in this country more than a few years—is the 'Leghorn,' for the introduction of which we are indebted to the Americans, who imported the first birds of the kind from Leghorn about twenty years ago, and have since then been improving the variety. It would appear to excel most others for early development and splendid laying powers, and is fast taking a prominent place with poultry-keepers. Prize birds of all distinct varieties are very valuable, sometimes fetching as much as twenty-five pounds for a single bird to shew and breed from.

It is a great mistake with some people to keep too many birds, and we have noticed again and again where a keen amateur has very reluctantly been persuaded to kill off or dispose of a portion of his stock, that instead of his egg-basket suffering owing to the fewer birds kept, it has actually become fuller than before. Only a certain quantity can be kept on a given space, and if more than this is attempted, failure must be the result. The proper number can be arrived at only by experience, but no cottager with limited accommodation should attempt to keep more than about half-a-dozen. The worst layers should be killed after their first season's laying, just before they commence to moult or cast their feathers—say about July or August; for if allowed once to begin this process of renewal, they are useless for the table until the whole of the new feathers grow again; and this sometimes occupies months, during the whole of which time laying is generally suspended. The best, however, should be kept over their second season's laying, and then killed before moulting; and none but the very best should ever be allowed to see a third season, for age is a very unprofitable and increasingly unprofitable possession. From one hundred to two hundred and fifty eggs may be expected from a good bird in the course of a year; and those which lay less than a hundred are not worth keeping. It may be mentioned that the addition of a cock to the run makes no difference in the number of eggs which the hens will lay; it is unnecessary, therefore, to keep a cock unless chickens be desired.

THE WALMER LIFE-BOAT.

HARK! a distant gun is sounding
O'er the waters, wildly bounding;
Raging waves are fast surrounding
Some wrecked ship to-night.
On the shore the breakers, roaring,
Loud as thunder now are pouring;
Far a signal high is soaring,
Like a phantom light.

Moon and stars their aid denying,
E'en to seek the living—dying—
Who, to prayers and tears replying,
Will the tempest face?
Oh! for some brave ocean-ranger,
Who would, through the cold and danger,
Go to save, perchance, one stranger!
Silence, for a space.

Hark! the Life-boat bell is ringing,
Gallant men are wildly springing,
Life and home—their all—they're dinging,
So the lost they save.
Rockets now are brightly flashing;
Through the shingle sharply crashing,
Off the Life-boat's swiftly dashing.
Heaven guard the brave!

Through the night, that wanes so slowly,
'Little ones,' in accents holy,
Mothers, wives, in dwellings lowly,
Breathe their heartfelt prayer.
When the stormy sea is swelling,
Aching hearts in regal dwelling,
All their pride and power quelling,
Kneel as helpless there.

While the torches, dimly burning,
Shew the tide at last is turning,
Hundreds wait, for tidings yearning,
Watch, with eager eyes:
See! the first faint glimpse of morning
The dim eastern sky adorning;
Hark! the soldiers' bugle, warning
That the sun doth rise.

Then a little speck grows clearer,
Draws—it seems but slowly—nearer,
Seen by those to whom 'tis dearer—
Known by them too well!
Brighter now the morn is growing,
Clearer, still, and clearer, throwing
Light upon the billows, shewing
'Tis no dream we tell.

Past the fatal sands they're leaving;
Hail! the Life-boat, proudly cleaving,
Where the angry sea is heaving
Mountain-waves of foam.
Onward, homeward, quickly nearing,
'Mid the ringing, deaf'ning cheering,
Loving words of welcome hearing,
Greet the conquerors home.

Far away the wreck is lying;
But they bring, 'neath colours flying,
Five poor Frenchmen, spared from dying,
Safe to England's isle.
English hands they're warmly pressing,
English children they're caressing,
Asking, praying, Heaven's blessing,
With a tear and smile.

Simple words tell acts of daring—
Unknown heroes laurels wearing,
Brother-like all honour sharing,
Now and evermore.
Speed the Life-boat, England's daughters;
Bless her path across the waters;
Tell her gallant deeds of glory;
Spread the truthful, noble story,
Far from England's shore!

PETER BOTTE.

IN the island of Mauritius, in the Southern Ocean, stands Pieter Both (or Peter Botte), one of the strangest shaped and most inaccessible mountains in the world. From the sea it is most calculated to impress beholders. Its quaint shape towers above the rugged mountain mass which again dominates over Port-Louis; and its still quainter name dates from so far back as 1616, when Pieter Both d'Amersfort, a Dutch admiral, or General of the Sea, as he is described in the records, happening to be shipwrecked on the island, was perpetuated by name in the mountain which cast its shadow across his drowned body.

The travellers' tales which are heard beyond the seas of the ascents of a mountain, insignificant in size, but by reputation ranking with monarchs of Alpine celebrity, have contributed to lend a grandeur and a mystery to Pieter Both in the imaginations of those who approach him for the first time. Though various ascents have been made from time to time (one of which was described in this *Journal* as far back as 1834), that made in June 1876 by a party of eleven seems to have been of special interest, as the following narrative, from the pen of one of the party, will shew. His story runs as follows:

An Indian, Deebee by name, a carriage driver by calling, by repeated ascents has made himself so much at home on the mountain as to be able to arrange a system of ropes and rough rope-ladders by which any one with a good head and fairly strong muscles can reach the top with comparative ease. Deebee is a short square-built East Indian, with a pock-marked face, whose dress on the last time I saw him was a soldier's old tunic, and a lady's 'cloud,' also old, about his head and chin. This worthy, after the preliminaries are settled with the leader of the expedition, purchases a coil of two and a half inch Manilla rope, arms himself with a wonderfully battered horse-pistol and a broken cutlass, takes into his confidence sundry others of his countrymen, and starts up the mountain the day previous to that on which the ascent

is to be attempted. Upon the 'Shoulder,' which I shall presently notice, he has built a small hut, where he and his band sleep; to me, who saw it empty, it seemed just capable of holding half one man, with the contingency that his other half would dangle over a precipice some hundreds of feet high. In the morning the ropes are fixed; the 'Ladder Rock' being ascended by means of a pole; the pistol is used to fire a line over the head, by which the rope is gradually hauled up; the cutlass is for cutting the rounds of the rope-ladders from the bushes; so that if all goes well, when the party gather on the 'Shoulder' they will see above them the whole apparatus, strangely suggestive of the Old Bailey on hanging mornings, with Deebee and his crew clinging thereto—a black Jack Ketch to perfection.

Pieter Both itself is one of a score of peaks situated in the rim of a gigantic crater, which can be traced at the present day from itself on the north to the Black River Mountains on the south, a distance of more than twenty miles. A mountain called 'The Pouce,' so called from the resemblance of its peak to a man's thumb, lies immediately above Port-Louis, and forms a well-known feature in the views of that town. After the Pouce, which is thirty-six feet only lower than Pieter Both, the crater-wall becomes a wall indeed. Its northern face falls down in sheer precipice to Pamplemousses, two thousand feet below its crest; the reverse, no less steep, facing the valley of Moka, green with sugar-canes, and fifteen hundred feet below. This wall is broken into several peaks, of which the last is Pieter Both, having an elevation above sea-level of two thousand six hundred and ninety-eight feet, according to a recent survey made by the colonial surveyor.

At La Laura, a sugar-mill about ten miles from Port-Louis, the final arrangements are made for carrying up the provisions and other impedimenta, including on this occasion a photographic apparatus; and that satisfactorily arranged, comes a trudge of a mile along a gently ascending cart-road.

As the path nears the woods we find their

margin impervious with the matted undergrowth; the bright green of the wild raspberry, with its hairy fruit, and long straggling branches armed with fearful thorns; the scarlet and orange blossoms of the *Lantana*; while the snowy white and pink blossoms of the many other species of underwood crowd in beneath the shade of the taller trees in a many coloured parterre.

Side by side with many other curious varieties of trees will be noted the fluted stem and broad spreading top of the mighty Sambalacoe, now fast disappearing under the axe. On either side of the road which winds along this forest line are the tall sugar-canes, like walls high above our heads, the silver-gray blossoms waving in the softly blowing trade-wind; the rain-drops hanging from their leaves, falling in showers, and giving a none too welcome hint of slippery work a little higher up. Between Pieter Both and the mountain ridge that joins him with the Pouce is a steep gorge, wide at the base, narrowing gradually till it ends abruptly in a gap some fifteen yards across, and about four hundred feet below the summit. You can climb up to this gap, but it requires to be cautiously approached, for on looking over its edge, sharp and knife-like, you will find yourself looking down a precipice of naked rock some two thousand feet deep. The lookout is grand beyond description, and you will make out Port-Louis harbour, looking about the size of the Round Pond in Kensington Gardens, and Pamplemousses Church a dot immediately below you.

The path ends with the canes; and that which we follow after leaving them we make for ourselves. But upwards is the right way; you can't go wrong, for the ravine is like a funnel cut in half, and the easiest slope lies in its centre, to which we all gravitate by a sort of 'natural selection.' The forest is dense under foot and overhead; perhaps it is as well that it is, for without clinging on to the branches and tree-stems, and swinging bodily by them up bad places, the lower part would be as difficult as the upper. The forest primeval, silent and gloomy, shuts out the light, and the air feels hot and stifling. Dead trunks lie rotting on all sides, mere touchwood many of them, resenting our footsteps by a cloud of dust; giving homes to a variety of lovely ferns, including the harts-tongue, which grows in tufts on the dead-wood wherever its roots can penetrate. Everywhere strange forms meet the eye, as if Nature in a frolic had run wild to form them. From the branches depend long trails of 'lianes,' ropes that twist and twine and squeeze the life out of the trees they fasten on. Orchids are here also, fleshy leaved, with no apparent roots; and black shapeless masses perched in the higher tree forks, the nests of the destructive white ant. Mosses clothe the ground with an emerald tapestry, beautiful to the eye, but treacherous and squelching full of water under foot. Everywhere is a rank garden of luxuriant dripping vegetation, which, speaking as to comfort, we could have done without.

After a stiff climb, the funnel narrows visibly, and we get into the central watercourse, where there is free space to breathe and less vegetation. The path is rough, macadamised by gigantic boulders, moss-grown and slippery, standing at incalculable angles, very tedious to clamber over, amongst which a sharp lookout has to be kept to preserve our poor dear shins. Gradually the trees, hitherto a green arcade overhead, thin away, and the water-course emerges into a steep grassy slope, growing steeper at every step. Above, facing us, is the gap spoken of already; on the left is the mountain ridge; on the right rises old Pieter Both, cold, gray, and menacing—and a long way up. The ravine has narrowed to some fifteen yards; here and there is a scrubby bush. The water-course is now the only way possible to climb by, and in two places there are in it rocks twelve feet high standing straight up, which have to be clambered over somehow.

Above, on the right, is the 'Shoulder,' a narrow projection about twenty yards long, and two or three wide, on which breakfast is to be eaten and preparations made for the final climb. To reach this 'Shoulder' appears a sufficient task from where we are; beyond it rises a smooth perpendicular cone, without flaw or crack, mid air, apparently impossible. Yet as we bend back our heads and say so, out of one side far up, springs a small figure; and the word 'impossible' is wiped out of our dictionaries when we behold that a 'black man and a brother' has essayed the task. Up to the 'Shoulder' it is all hands and feet; beyond that there is nothing for it but rope. Viewed from a distance, the 'Shoulder' forms the knees of the sitting figure which the mountain is said to resemble. From many points the resemblance to the statue of Her Majesty at the London Royal Exchange is ludicrously exact.

When the top of the grass slope is reached, there is a narrow band of turf, dotted with half-a-dozen scrub bushes of a foot or little more high. This band leads off horizontally to the right, and is the only possible way to the 'Shoulder.' A very bad way indeed it is. From below it looks nothing but a strip of green ribbon stretched across the middle of a rocky face, black and green and slimy as ever earth, air, and water put together have concocted to puzzle mountaineers. In truth it is little better than it looks. There are toe-holes to stick your boots into as you walk with your face to the wall; and here and there a shrub to let you feel something between your fingers, besides a bunch of dead damp grass to save you from eternity. The whole passage is oozing with sludge and water, very slippery, and the grass looks utterly rotten and unreliable.

This track, which is about one hundred yards in length, lands you a little below the 'Shoulder'; then a dozen yards' stiff steep climb and you stand upon it—perhaps sit at first—for a yard farther on across it is space, sheer awful space, which to look down till you have got your breath is neither wise nor pleasant. You soon get used to the feeling; but it is a little startling just at first to find that this promised landing-place where breakfast is to

be served ends in nothing, just three feet beyond the baskets that contain the provender. When you have got your breath, the first thing to look at is the great bare cone immediately above and the dangling rope up which your road must lie. Your eye takes it all in at a glance, and that first glance is not promising. But breakfast puts a better construction on the onward journey; and by the time we have made acquaintance with the Oxford sausages and Australian sheep's tongues, we begin to scramble about quite merrily, and doff boots, coats, and hats for the task with as jaunty a grace as did my Lord Russell on Tower Hill.

The summit of Pieter Both is a cone of sugar-loaf form, compressed at the sides, that nearest the 'Shoulder' having a slight bulge, without which the ascent would be certainly impracticable. From the 'Shoulder,' which is covered with short grass and wind-scarred scrub, a ridge some three yards wide runs up to the foot of the 'Ladder Rock.' This ridge, which narrows as it goes up, is composed of rock-fractures firmly cemented together, and is to all appearance a great buttress supporting the cone. Up this you climb, hands and knees, without requiring a rope. The buttress comes to an abrupt end at the foot of a huge cube of rock, flat-sided and perpendicular, which stands bolt upright, and lars all further climbing without mechanical aid.

This is the 'Ladder Rock,' and is between fifty and sixty feet in absolute perpendicular height, its breadth being less than twenty feet. Running down its centre is a crack, without which the difficulty of climbing it would have been greatly aggravated, if not insurmountable. Against the face of the 'Ladder Rock' hangs a rope, the end disappearing over the upper edge where it has been made fast; the climb up it being made easier by a rough rope-ladder, which takes you up some dozen feet, to where the crack is sufficiently wide to admit your toes; that reached, grasping the rope with every one of your ten fingers, and squeezing as many of your toes into the crevice as you can, you must trust to your muscles and swing yourself up. The top of this rock reached, you are glad to sit or lie down upon a second ridge like the lower one, but much steeper and narrower; so narrow that in climbing up it, still with the rope tightly grasped, you sit astride it, your legs dangling over the sides, where it is better not to let your eyes follow unless the head that owns them is of the steadiest. This ridge has been christened 'The Saddle,' and is made up of broken rock cemented together with lava. Here and there are tufts of grass, with bosses of the silver-leaved 'everlastings,' wind-torn and ragged, and other plants. The 'everlastings' shew brightly against the cold gray rocks, and tempt many of the party to pluck them to adorn their hats when they get them; which just now is somewhat doubtful, as the slightest slip may be fatal. This dreadful 'Saddle' is said to have once vanquished two aspirants; one of them, conscious that he had 'lost his head,' lay flat along the ridge, allowing the man who came to his rescue to climb over his body, a ticklish bit of mid-aërial gymnastics, which happily came off successfully.

The 'Saddle' rises at a steep angle, say the steep roof of a house, and ends at another 'facer,' a huge rounded rock perhaps ten feet high standing straight up across the way, the way now having narrowed to a blunt-knife edge. This is

the 'Saddle Rock,' and is the most perilous-looking and most dangerous place in the ascent. The 'Saddle Rock' must either be swarmed up or circumvented by stretching round its left side; for both experiments a rope is needed, and both are a trifle delicate. This time the rope went round; and the thread which disappeared past the smooth slippery face, out over the ghastly precipice, that fell down sheer into Pamplémousses, was not inviting. To get round you have to sidle up to the base of the rock, holding the tightly stretched rope level with your head, and push on your feet inch by inch till your toes rest on the outermost knob of rock. You must be quite sure that their hold is good before you slip your hands round the corner, letting your head and shoulders follow until you can make out a little branch as thick as your umbrella, and four inches long, which sticks out of a cranny, and is within reach of a long straddle. The awkward part of this is that in looking for the branch you are obliged to look down. It is the first look-down absolutely necessary, and it is one not easily forgotten. To the writer it had a strange fascination. The actual peril of the position; the necessity of coolness in head and eye; the uncertainty how far this could be relied upon, was so startling, so vivid when the actual time came, as to force a feeling of absolute security upon the mind! Never did he feel more certain of his own powers than when hanging like a spread-eagle against the face of that rock twenty-six hundred feet above the plains.

It is a good stretch, but does not require very long legs to do it. One toe, no more, the right one on a knob of rock; the other foot feeling for those four inches of scrub wood; both hands overhead grasping the rope; and the strangest bird's-eye view between one's legs that featherless biped could wish for. It did not do to look too long. Another pull up is in front, along a ridge like the previous two, but narrower again, which runs up to the Neck, the rope your companion all the way; and then you can at last sit down in perfect safety. This is the 'Neck,' which the aneroid gave as three hundred and forty feet above the 'Shoulder.' It forms an irregular plateau partly round the 'Head,' some six or eight feet broad, and quite flat. On it is a carpet of rough grass and 'everlastings,' protected from the wind and rain by the overhanging mass of rock, which is the 'Head,' formed of irregularly shaped rock, forty feet in height, nearly round, and which contains what there is of the brains of Pieter Both.

A notch in one side allows the rope which has been already passed over, to rest without fear of slipping; and depending from this is a short rope-ladder, hanging quite clear of everything over the rim of the Neck. Its half-dozen rounds put the rope between your fingers; and in less time than it takes to write it you are on the old fellow's brain-pan, the keen air racing past, with no more harm done than a few 'barked' knuckles, and a queer growing feeling in one's head of utter loneliness. Nothing but space all round; blue sky; white scudding clouds quite close, which turn one giddy; for it seems to be that we on our little plateau are racing past the clouds, borne noiselessly, interminably; flung on some tiny planet whirling around an endless orbit. There was another feeling to confess to, suggested by that thin white rope creeping and disappearing over the bare edge—suppose it

broke, or was cut or frayed through! It was our sole connecting link with home and life and dinner. How hungry we should be if anything were to happen to that rope! how thirsty! how cold in the chill night! how wet in the company of those drifting clouds! Insensibly one fell to calculating which was the fattest for to-morrow's meal.

From our airy resting-place, the whole circumference of Mauritius, with a small exception, can be traced. From its height everything below is strangely dwarfed. Port-Louis as a town is barely visible; the harbour, which is nearly two miles in length, is a mere strip of water; moving objects are as much obliterated as if the land below was a printed map; sounds there are none, absolute silence, broken only by the whistle of the wind. In Mauritius, there is a paucity of animal life even in the valleys; it is possible to walk for miles without hearing a bird's note. On Pieter Both are no birds—even the lizards don't attempt him. Now and again a tropic bird, the *Paille en queue* of the French, sails past, screaming his news from the sea beyond. One by one our party gained the top, each one as he pulled himself over the edge lying down for breath. Our feet, innocent of shoe-leather, had lost some of their own, and more than one pair shewed signs of rough usage. But what were a few scars to the triumph of sitting perched on Pieter Both—the dear old Peter Botte of childhood's picture-book.

As the party met and got their breath, tongues were unloosed, and the serious concentrated look that had sat on most faces hitherto, melted under the influence of mutual congratulations. Eleven in all, without counting Deebee and an assistant Indian, were gathered on the 'Head;' sitting, standing, lying on that patch of black soil which Claude Penthé spoke of for the first time nearly ninety years ago. The sheet of lead for inscribing the names of the 'visitors' was there, but of a tin box which was known to have been left, not a trace remains; some passing hurricane has probably spirited it away. The descent was safely made, though it is perhaps more awkward than the going up. Some photographs were taken from the 'Shoulder,' on so narrow a shelf that it was necessary to place a man at each leg of the tripod to prevent the camera toppling over; a final glass drained to the health of the old gray rock; and about four o'clock in the afternoon, La Laura and the pleasant sugar-cane fields were reached without a single mishap.

It may be thought worthy to record the names of this the largest party that ever made the ascent of Pieter Both. He is not likely to be visited again for some time to come, and long before this account appears, the whole eleven will be scattered far and wide—miles distant from that strange, eerie trysting-place. They are: Lieutenants MacIlwaine, Creswell, Bayly, and Midshipman Elwes of H.M.S. *Undaunted*. Major Anderson, Captain Bond, Lieutenants Philipps, Hammans, Sillery, and Saunders of H.M. 32^d Regiment; and Captain Montague, Brigade Major. A pole was rigged up, and the Union-Jack hoisted and left flying, as a remembrance of the day, and as a sign to the many in town that the ascent had been successful. On the day told us afterwards that through a telegraph, the movements had been perfectly traced; far a sign, the 'Saddle Rock,' where the

rope stretches round the face of the mountain opposite Port-Louis, having caused the strongest sensation, as our bodies, dwarfed to the size of spiders, came out against the sky. W. E. M.

THE LAST OF THE HADDONS.

CHAPTER XXXIV.—TWO LETTERS.

AFTER arranging everything else, I sat down to write my farewell letters, commencing with one to Philip, and being very careful to allow no tears to fall upon the paper.

'DEAR PHILIP—I ought to have told you what I am about to write, when I bade you farewell this morning; but I wanted our parting to be, as it was, a happy one. Had I had the courage to tell you, instead of writing, I know you would not have yielded to me; perhaps you would not even have listened. When you read this, your blame cannot reach me; and until you can forgive me, we shall not meet again. Dear Philip, I cannot be your wife. I must bear all the blame of not making it known to you until now, as best I may; but I cannot marry you. The conviction has only become absolutely clear to me since you so much pressed me to make no longer delay.'

'Ah Philip, may you never suspect how it was made clear to me!' I mentally ejaculated, breaking down for a few moments in an agony of suffering. But I sternly called myself to order, and was presently bending to my task again.

'I have chosen a different life, and only delay explaining what that life is, and why it now seems more congenial to me than being a wife' (to the man who loves another woman, was in my thoughts), 'until you have quite forgiven me. Indeed, it is the belief that that time will come, which gives me the courage to act as I am doing. But there is one way, and only one, by which you can prove that your forgiveness is sincere, and give me the comfort of believing that I have not shadowed your life. If I hear that you are able, by-and-by, to find some other woman more appreciative than I'—

I dropped the pen, and bowed my face upon my hands again in the bitterness of grief. 'More appreciative than I!' But I forced myself to my task again, and left the words as they were. If he once suspected that it was a sacrifice, would he accept it, however willingly it were offered? Loved he not honour more? Besides, this must be a letter which he could shew to Lilian; at anyrate by-and-by, and no suspicion of the truth must reach her.

'If that time comes, and I earnestly desire that it may, I shall be able perhaps to justify myself to my own conscience. I know only one whom I should consider worthy of you, one not to be easily won, but worth the labour of a lifetime to win. I dare not name her—I am almost afraid to write of her. But, dear Philip, if it could be—if she whom I love above all other women could be in time won to make up to you for the loss of me, I shall have

nothing to regret. I can only repeat that nothing but the knowledge of your happiness will give me the courage to hope for your forgiveness and to meet you again. Meantime, I can only beg you to try to believe in your loving sister

MARY.

I read the letter through with not a little dissatisfaction, though I could not see how to amend it. It had been so difficult to say sufficient to serve the purpose without giving some clue to the truth. I could not help a little bitter smile at the reflection how very different would his judgment of that letter have been if he loved me! How scornfully would such excuses have been swept away if I had been the woman he loved! How angrily he would have taunted me for being what in fact I should have been had I deliberately wronged him! Alas! I was writing to a man whose love for me was dead, and who yet desired to act honourably towards me. He would not be inclined to be unkindly critical about my manner of setting him free, if I could only contrive to make him believe that I wished to do so.

To Lilian I wrote in a somewhat more jaunty strain. Better that my letter should seem to be written even flightily than sadly. But I had been so little accustomed to this kind of diplomacy, that I was astonished as well as saddened to find how close one might keep to the truth in the letter, whilst departing so far from it in the spirit. Neither to Philip nor to Lilian did I dare to tell the truth, and yet I could write all this without appearing to depart from it! Fortunately this kind of diplomacy blinds none who are not inclined to be blinded.

'MY DEAR SISTER—You must try not to be very angry with me for running away without bidding you farewell in some better fashion than this. But by acting as I am doing, I avoid your scoldings, or perhaps I had better say pleadings. It is really no use arguing with a person like me, as I think you have discovered before now. And as I have very deliberately made up my mind, there really is nothing to be done. You have, I know, been a great deal puzzled of late to account for the change which you have perceived in me, and as I could not explain it without shocking you, I have waited to get out of the way first. Dear Lilian, I was not in jest when I told you I had begun to suspect that marriage is not my vocation; and I have at length come to the conclusion to obey my instincts, which tend in another direction. I believe that you will in time agree with me in thinking that I have done for the best; though I fear you will be very angry with me at first, not being able to see all my motives. Please get dear Mrs Tipper to ask Philip to come down sometimes, and try what you both can do to cheer and comfort him. He knows so few people, and he will be so terribly lonely. I must trust that in time he will come to acknowledge that I may not be altogether so selfish and inconsiderate as I must appear to be to him and to all of you in the first moments of disappointment. I will say this much to you, dear sister—I feel, and the feeling is not altogether of sudden growth, that I am too old for Philip; or

perhaps I ought rather to say he is too young for me. At anyrate I have chosen a different life, and only wait until I feel sure that you have all forgiven me, to prove to you that I am happy in it. Say all that is kind to dear Mrs Tipper for me. I must hope to be able to prove my gratitude to her by-and-by. Ah Lilian, my sister, if I dared to write about my hopes! I can only say that if Philip is in time fortunate enough to find some good woman willing to make up for the past to him, my gratitude towards her will be very great. I am going away because I think it is best for us all that I should go, and because the persuasions which your love might prompt you to use would not induce me to alter my decision. I have begged Philip to try to believe in a sister's love, and I ask you too, dear Lilian, to believe in the love of your sister

MARY.

Little as I was satisfied with these two letters, I knew that I should not be able to improve upon them, however much I might try to do so. The fault was that I could not be explicit; and that would be apparent to myself if not to the others, however elegantly my sentences might be turned.

I put the letters aside until they should be required, and then lay down for a few hours' rest. Thank God it *was* rest! I fell into a deep dreamless sleep, and only awoke when Becky came to call me in the morning. There was still the same expression in her face, half sorrow, half pity, as though she saw cause for both as she looked at me.

'Now, Becky, you must not look at me in that way, to begin with. I am going to depend a great deal upon you, and it will not do to let your face tell all you are thinking about, as it is doing now.'

'I can't help it shewing, because— O Miss Haddon, dear, I know you are not so happy as you pretend to be—I know it! And it's ever so much worse to see you look like that, than as if you were crying and sobbing!'

I saw that it was no use trying to throw dust into Becky's eyes.

'Well, suppose I am not very happy, Becky, and suppose I have some good reason for pretending, as you call it, to be so. Suppose that I do not wish to grieve your dear old mistress and Miss Lilian by allowing them to see that I am unhappy. It is of great importance that I should appear cheerful to-day; and I want you to help me as much as possible to make them think that I am, for—Becky, I am going away, and they must not know I am going.'

Becky threw up her hands. 'Going away!'

'Hush! No one but you must know that I am going.'

She was on the carpet clinging to my feet. 'Take me with you; do, pray, take me, Miss Haddon, dear; no one will ever love you better, and I can't stay without you!'

I made her get up; and taking her two hands in mine, murmured in a broken voice: 'Try to trust me, Becky. If I could take you with me, it would be very selfish of me to do so. It is your duty to stay here, as it is my duty to go. But I shall not be so far away as I wish them to believe I am—recollect, as I *wish* them to believe; and I may be able to see you frequently, if I find that I can trust you to keep my secret.'

'You may trust me, Miss.'

'I am sure I can, or I would not ask you to help me. I must not break down this last day, Becky; for the sake of others as well as myself, I must not.'

She dried her eyes; and presently the expression I wanted came into her face.

'Please forgive me; I won't shew it any more; and I will do anything you tell me.'

'First, and above all, you must earnestly do what you can to assist me to make it appear that I am feeling neither sorrow nor anger to-day, Becky.'

'I will,' she replied, simply and honestly.

'And next, I want you to contrive to carry that small portmanteau into the wood for me at dusk this evening, when some one will meet you, and bring it to me. You must contrive it so that no one will know that you have helped me. The best time for you to take it will be whilst the ladies are at tea. If you take in tea at the usual time, precisely at seven, you would have a spare half hour, which would be time enough. Slip out the back way, and carry it anyway. I cannot take it myself, as there must be no good-bye.'

'Very well, Miss. This one?'

'Yes. It is not too heavy for you, I hope?'

'O no, Miss; it is not that;,' lugubriously.

'Now, Becky, please do not forget. That is not looking cheerful, you know.'

'No, Miss Haddon, dear; I won't forget, when I'm down-stairs.'

Fortunately, she helped me to get up a smile, to begin with, at the breakfast-table. How shall I describe the expression of Becky's face when she came in with the coffee, &c. Her mouth was distended with a grin, which was in strange contrast with the sadness in her eyes, and her whole face reminding one, as Lilian said, of an india-rubber one pulled out of shape!

Whenever she entered the room there was the same grin on her face. In fact, in her anxiety to be loyal to me, she was overacting her part, and it culminated, when, after looking at her in some astonishment, Lilian inquired if she had received any good news.

'Yes—no. It's only because I'm so happy to-day, Miss,' returned Becky, with a still more alarming distension of her mouth.

I think Mrs Tipper had occasion afterwards to congratulate herself upon Becky's 'happy days' not coming very frequently.

'She has broken two plates and a cup already, my dears,' anxiously said the little lady to Lilian and me. 'And I can't find in my heart to be angry with her about it, when she says it's through being so happy; but really, you know, it is a most unfortunate way of shewing her happiness.'

Lilian and I made a merry little jest at it, advising her to look sharply after such household treasures as Windsor Castle, &c.

'I wouldn't let her dust them to-day for the world, my dears,' ejaculated the little lady, hastily trotting off to the kitchen again.

I did not allow Lilian to make her escape afterwards. I smilingly decided that there was to be no French history to-day, and that she and I were to spend the morning together in the old delightful fashion of the past. Philip was not coming for a day or two; and we would go over some of the old work, which had been somewhat neglected of late, with the exception of music and singing. A little

steady work, and the consultations over it, was bracing for us both, and set us at our ease as personal talk would certainly not have done. We were not, either of us, strong enough just then to talk about ourselves. Moreover, I begged Mrs Tipper to make it a fête-day, and treat us to one of her famous lemon puddings; and she was enjoying herself to her heart's content in the kitchen, only too delighted to be asked to treat us, and bent upon shewing that a lemon pudding was not enough to constitute a feast in her estimation. The only disturbing influence was poor Becky's hilarity.

'My dears, it really is not natural,' the little lady confided to us at dinner. 'No more like smiling than a baby in convulsions. I was almost frightened at the strange faces she made just now in the kitchen; and if it goes on, I must make her take some medicine.'

I begged Becky off that infliction, persuading her anxious mistress to wait a few hours.

Kind Becky! she would very soon be able to look as she felt. There would be nothing unnatural in her regret at my departure, after having known me so long a time. On the whole, I was more successful than I had dared to hope for in the way of leaving a pleasant impression upon the minds of Mrs Tipper and Lilian—just the impression I wished to give them.

They believed that I was happier than I had been for some time previously, and I know now that they attributed my happiness to the fact of the date being at length fixed for my wedding to take place. They had seen just enough to perceive that some disturbing influence was at work with me; and the sudden change in my bearing seemed to them to imply that my doubts and fears were now set at rest. It did me real good to witness the unfeigned relief in Lilian's face; the unselfishness which could rejoice in my happiness though her own might be wrecked. I know now how much she had suffered from shame and dread—how terribly afraid she had been lest I should divine any part of the truth; lamenting over what she considered to be her disloyalty to me, and blaming herself as she certainly did not deserve to be blamed.

'Dear Mary, it seems quite like old times again; does it not?' she said, looking up into my face with the nearest approach to happiness in her own which I had seen there for some time, as I bent over her with a playful criticism upon a bit of foliage she was doing.

'It has been a pleasant day, has it not, dearie?' I returned. 'All the pleasant for French history being kept out of the programme, I think. You know I never did take kindly to that.'

She flushed up, nestling closer to my side. 'There shall be no more of it, Mary,' she whispered.

I replied with a tender kiss; then lightly said: 'I really feel quite kissably inclined this afternoon!' turning to my dear old friend, and giving her two or three hearty good-bye kisses, then back again to Lilian with a last hug.

'And now, I must run off again;' adding as I reached the door: 'Do not wait tea for me. I shall not be able to get back by then.'

'To town! Mary?' asked Lilian. 'And I am not to be permitted to accompany you again. I feel sure there must be something very mysterious going on!'

But she was smiling, and I believe that both she and her aunt were now quite at ease about it, having made up their minds that their first surmise—that I was preparing some pretty surprise for them—was a correct one.

I ran up to my room, hastily indicated to Becky where she was to find the two letters in a couple of hours' time, put on my bonnet and cloak, gave a quiet embrace and warning look to the faithful girl, sobbing under her breath, then went downstairs again. I dared not venture to go into the little parlour for a last word, lest some tender speech of Lilian's should cause me to break down; so little would do it just now, when every nerve was stretched to its utmost tension.

I passed swiftly out, and down the garden path, only venturing to give one look back to nod and kiss my hand, when I reached the gate, and then sped on as fast as my feet would carry me. I was just turning into the lane which led towards the stile, when suddenly I found myself face to face with Robert Wentworth.

'Where are you going to at that rate, Mary?'

I shrank back, for a moment incapable of uttering a word; eyeing him desperately, almost defiantly, for I felt in my misery as though he had suddenly presented himself in my path to bar my escape—a new power to strive against, when my strength was almost spent. He could always see deeper than any one else; and he had come upon me when I was so unprepared. I had just dropped the smiling mask which I had found it so difficult to wear all day, and was beginning to feel sufficiently secure from observation to be less careful as to what my face might tell. I caught in my breath, shrinking farther away, but facing him like an animal at bay. For a few moments he stood gazing at me, apparently as much at a loss for words as I was myself, then his eyes fell upon my muffled hand, and he asked: 'Have you hurt your hand, Mary?'

'Yes.'

'Not seriously, I hope? How did it happen?'

I looked down at my hand in a dazed kind of way, trying to recollect what had happened to it. 'I don't know. Good-bye.'

'Mary! is there anything to be done which a brother might do for you?' he asked in a low troubled voice.

I tried to think what brothers could do, and what there was to be done for me, then shook my head.

'For old friendship's sake, do treat me as a brother now, Mary!'

His very evident perturbation had the good effect of making me rally my scattered wits, and I was so far like myself again as to reply: 'The only—only way in which you can help me just now is to let me go without any further questioning.'

He stood aside at once without a word, and I passed on. But I had no sooner done so than my conscience smote me. Was *this* the way to part from him—the one above all others so true to me? I turned back to where he remained standing, laid my hand for a moment upon his arm, and said: 'Please forgive my rudeness, Robert; and believe that if there were anything for a brother to do, I would ask you to do it. And perhaps you *will* be able to help me presently in trying to convince them that, however blamable I may at first appear, I have acted, as I believe, for the best;'

thinking that they might possibly turn to him for advice and assistance. Then offering my hand, I added tremulously: 'Good-bye, Robert.'

'God keep you, Mary!'

(To be concluded next month.)

CURIOSITIES OF THE VOICE.

SOME years ago, a delightfully interesting book was written by Sir Charles Bell on the human Hand. There might be fully as interesting a work written on the mechanism of the human voice, in which would be equally demonstrated the power, wisdom, and goodness of the Creator. We offer a few observations on the subject. Until recently, there were mysteries difficult to explain concerning the wonderful inflections in the voice. Now, it is thoroughly understood how words are produced, and how the throat is able to send forth a wide variety of charming notes in singing. We begin by mentioning that Dr Mandl has devoted himself to the study of the organs of speech, and from his work on the *Larynx* we give some interesting particulars. Investigators have long been occupied with researches; but until they had seen the larynx of a living being one thing only was proved, that the voice was formed in the glottis. For fifty years of this century they were trying by mirrors and other appliances to examine the interior of this organ, but without results. Suddenly an inspiration came into the head of a celebrated singer, whose name awakens charming remembrances among old amateurs. This was M. Manuel Garcia. Ignorant of all the trouble which surgeons had taken in order to observe the movements of the throat in the act of singing, he conceived the idea of looking at himself. By the help of two mirrors, the one reflecting the image on to the other, he saw the whole of his larynx depicted. In ecstasy before the glass, he determined to pursue the accidental discovery which had been so long dreamed of. But the autumn had set in, and the sun's rays, which were necessary to success, did not lend their aid. London with its fogs forced him to try artificial light, the results of which were unsuccessful, and therefore he could only profit by fine days; yet he soon recognised how isolated sounds were produced. In 1855 the Royal Society received some communications from him on these curious studies.

The subject was at once taken up with great activity, especially in Vienna, where success was far from equalling the hopes of the doctors. The caprices of solar light and the defects of artificial threw them into a state of despair. By all means they must improve their mirrors. Czermak, the Professor of Physiology at Pesth, taking an example from the instrument used in examining the eye, the ophthalmoscope, had recourse to a concave mirror which concentrated the light. From this time there was no difficulty but to perfect the lenses. Czermak having acquired great skill in the use of his laryngoscope, visited the principal cities of Germany, where his demonstrations deeply interested surgeons and physiologists. He was warmly received in Paris in 1860, where he shewed not only the whole length of his larynx, but also the interior of the trachea or windpipe as far as its bifurcation; a spectacle truly astonishing to those who witness it for the first time. It is not possible to examine the organ of the voice

with the same facility in all; a man must have had some experience before he can do it.

A slight sketch of this organ will perhaps make the subject clearer. From the breast there rises to the middle of the neck the passage for the air between the lungs and the mouth; at one end it is divided into numerous branches, called the bronchial tubes; at the upper end, like the capital of a column, is seen the larynx, resembling an angular box; strong cartilages make it very resistant; and the interior is lined with a mucous membrane forming folds, named the vocal lips. These separate, lengthen, or shorten in the formation of various sounds. The largest of the four cartilages rises in an annular form, and protects the whole structure. It is but slightly shewn in the neck of the female, but strongly marked in the man, and is popularly called Adam's-apple. Like everything else, the larynx presents individual differences. A fine development is an indication of a powerful voice. As the child grows up, there is a sudden alteration and increase of size; but it always remains smaller in the woman than in the man; the angles are less sharp, the muscles weaker, the cartilages thinner and more supple, which accounts for the sharp treble notes in their voices.

Singing demands a different kind of activity in the organs from speaking. In society, where education requires a submission to rule, singing belongs to the domain of art; but in a primitive state all nations have their songs. Musical rhythm drives away weariness, lessens fatigue, detaches the mind from the painful realities of life, and braces up the courage to meet danger. Soldiers march to their war-songs; the labourer rests, listening to a joyous carol. In the solitary chamber, the needlewoman accompanies her work with some love-ditty; and in divine worship the heart is raised above earthly things by the solemn chant.

A strong physical constitution and a perfect regularity in the functions of the organs used in singing, are inappreciable advantages. They should be capable of rendering an inspiration short and easy, the expiration slow and prolonged; there is a struggle between retaining and releasing the air, and with the well-endowed artiste the larynx preserves its position, notwithstanding the great variety of sounds which it emits. But the evolutions of the parts are multiplied, the vocal lips vibrate, and the configuration of the cavity modifies the sounds which are formed in the glottis, and determine the tone of the voice. The most energetic efforts of the will cannot change this tone in any sensible manner. Professors injure their pupils by prescribing the position of the mouth, from which perhaps they themselves derive an advantage.

It is interesting to watch the play of the organs by the help of the laryngoscope, and see the changes which succeed one another in the low and high notes. At the moment when the sound issues, the glottis is exactly closed; then the orifice becomes a very long figure, pointed at the two extremities. As the sound rises, the vocal lips approach each other, and seem to divide the orifice into two parts; then as the highest notes are sounded, there is but a slit the width of a line. The vocal lips change like the glottis; they stretch out, harden, thicken, and vibrate more and more as the voice rises. Women, who have a smaller larynx and shorter vocal lips, can sing higher notes

than men, with a tone less powerful, but sweeter, more uniform, and melodious.

The ordinary limits of the voice comprehend about two octaves of the musical scale: it can easily be increased to two and a half; but some reach the very exceptional range of three, and three and a half. Thus at the commencement of this century, Catalani astonished every one who heard her, as a sort of prodigy. Suppleness and intensity may be acquired by practice, as has been proved in the case of many singers: the voice of Marie Garcia was harsh, but it became at last the delicious one of Madame Malibran. In general, the natural gift is manifested without culture; the child endowed with this great charm warbles like a bird for amusement; a lover of art passes by, listens with surprise, and promises glory and fortune to the rival of the lark. Thus the famous Rubini won his triumphs. Occasionally the singer has in a moment lost all power, and an enchanting voice will disappear never to return; such a misfortune befell Cornelia Falcon.

Those who have watched the formation of vowels and consonants can describe very precisely the positions which the lips, tongue, and palate take in articulation. Yet almost identical sounds can be produced with different positions. As we all know, the teeth are a great help to pronunciation, but a person who has lost all his teeth can modify the play of the lips and tongue and express himself intelligibly. Actors imitate the voice of public characters so as to make the illusion complete. The ventriloquist can make his voice issue as if from a cavern. When misfortune has deprived a man of the whole or part of his tongue, he can still hold a conversation, though the sounds are never particularly agreeable. All this shews that there is nothing absolute in the actions which form words, though in general the same organs play similar parts. Those who were born deaf have ceased to be dumb by interpreting the movements of the mouth with wonderful certainty: they guess the words of the speaker instead of hearing them, and so learn to speak by imitation, their speaking, however, being seldom well modulated. There are now several institutions where the poor creatures who have been deprived of one of their senses can acquire a means of communicating with their companions without the tedious intervention of writing. The master indicates to the child how he must open his mouth, place his tongue and lips; he then draws the pupil's hand over his own larynx, so that he may feel the movement. Those who, like the writer, have seen this reading from the lips, will be struck with the surprising delicacy of the impressions made on the eye which has been thus cultivated.

In comparison with the human voice, that of animals seems poor indeed. The barking of the dog, the mewling of the cat, the bleating of sheep, cannot be called language, in the proper sense. Yet the larynx of these creatures is on the same plan as that of man. Among monkeys the resemblance is perfect. To all appearance the impossibility of speaking is due to the formation of the lips and tongue. In 1715 Leibnitz announced to the French Academy that he had met with a common peasant's dog that could repeat thirty words after its master. In spite of such an authority, we must always say when we most admire the intelligence of this faithful companion: 'He only wants words.'

So well endowed with memory, affection, and intelligence, he can only express his joy by sharp, short expirations of air through the glottis. Howling is a prolonged note in the pharynx, excited by deep grief or pain. Yet they in common with many other animals can communicate with each other in a marvellous manner when they wish to organise an expedition. A dead bullock was lying in a waste far from all habitations, when a solitary dog, attracted by the smell, came and fed upon it; immediately he returned to the village and called together his acquaintances. In less than an hour the bones were picked clean by the troop.

Opportunities for studying the language of wild animals are rare: they fly from man, and when in captivity they become nearly silent, only uttering a few cries or murmurs. Travellers have sometimes been able to watch the graceful movements of the smaller African apes. Living in the branches of trees, they descend with great prudence. An old male, who is the chief, climbs to the top and looks all around; if satisfied, he utters guttural sounds to tranquillise his band; but if he perceive danger, there is a special cry, an advertisement which does not deceive, and immediately they all disperse. On one occasion a naturalist watched a solitary monkey as he discovered an orange-tree laden with fruit. Without returning, he uttered short cries; his companions understood the signal, and in a moment they were collected under the tree, only too happy to share its beautiful fruit. Some kinds possess a curious appendage, a sort of aërial pouch, which opens into the interior of the larynx and makes a tremendous sound. These howling apes, also called Stentors, inhabit the deepest forests of the New World; and their cries, according to Humboldt, may be heard at the distance of one or two miles.

If it be ever possible to observe the play of the larynx of animals during the emission of sounds, the subject will be a very curious one. The difficulty seems almost insurmountable, as their goodwill must be enlisted; yet M. Mandl, full of confidence in his use of the laryngoscope, does not despair. After man, among animated nature, the birds occupy the highest rank in nature's concerts; they make the woods, the gardens, and the fields resound with their merry warbles. Cuvier discovered the exact place from which their note issues. They possess a double larynx, the one creating the sounds, the other resounding them: naturalists call the apparatus a drum. Thus two lips form the vocal cords, which are stretched or relaxed by a very complicated action of the muscles. This accounts for the immense variety of sounds among birds, replying to the diversity in the structure of the larynx.

The greater number of small birds have cries of joy or fear, appeals for help, cries of war. All these explosions of voice borrow the sounds of vowels and consonants, and shew how easy and natural is articulation among them. Those species which are distinguished as song-birds have a very complicated vocal apparatus. For the quality of tone, power, brilliancy, and sweetness, the nightingale stands unrivalled; yet it does not acquire this talent without long practice, the young ones being generally mediocre. The parrots which live in large numbers under the brightest suns, have a love for chattering which captivity does not lessen. Atten-

tive to every voice and noise, they imitate them with extraordinary facility; and the phenomenon of their articulating words is still unexplained. It is supposed that there is a peculiar activity in the upper larynx. As a rule, they attach no meaning to what they say; but there are exceptions. When very intelligent and well instructed, these birds—such as Mr Truefitt's late parrot, an account of which appeared in this *Journal* in 1874—can give a suitable answer to certain questions.

Our notes on this interesting study come to a close. Man is well served by his voice; words are the necessity of every-day life; singing is its pleasure and recreation, whether the performers are human beings or birds.

FOX-HUNTING ON THE MOUNTAINS OF SCOTLAND.

THE light of an almost full moon was struggling with the first faint glimmer of dawn one morning late in February as I sprang out of bed and looked through my window. I could see a few fleecy clouds racing across that luminary; and away in the north-east lay a dark bank, speaking of the direction taken by the storm which I had heard at intervals during the night; but otherwise the sky was clear and gave promise of at least a few hours' respite from the almost ceaseless rain of the previous two months. Such being the case, I lost no time in dressing and in calling my companion; and before another day had fairly begun, we were passing through the fresh clear air on our way to the hill, accompanied by two couple of fox-hounds, while an irrepressible terrier who would not be denied found its way to its owner's heels before we had gone many hundred yards.

Foxes in the Highlands are held in very different estimation from the same animal farther south. Death, meted out with all weapons and under all circumstances, is their lot whenever found; and few acts are considered more meritorious or more deserving of public thanks than the destruction of a vixen and her cubs. Little fault can be found with such a state of affairs when it is remembered that hunting is impossible, and that otherwise foxes would increase to such an extent as not only to do great damage to game, but to become a serious tax upon the sheep-farmer, especially during the spring, when quantities of lambs fall victims even under present circumstances. The great extent of many Highland properties and the small number of keepers employed, render it impossible for them to keep the foxes under without assistance; and the result has been the installation of a regular district fox-hunter, whose one employment is to go about from farm to farm accompanied by his hounds and terriers, and kill foxes, on consideration of receiving a toll of so much per score of sheep, as well as free quarters for as long as he chooses to stay.

Such was my companion on this occasion. He deserves, however, a more than general notice. To watch him as he sat over-night by the kitchen-fire, his chin almost resting on his knees, no one would guess, from his bent and stiffened appearance and long white hair, that they were looking at the best hill-man within a radius of fifty miles; a man who on three different occasions had ventured alone on the outlying heights during the worst

of a wild snow-storm in search of missing shepherds, and who had succeeded in bringing two of them home alive, despite having to carry one for nearly five miles through drifts out of which no other man in the glen would have had a chance of extricating himself. Although now near sixty years of age, time did not seem to have had any effect upon his physical powers; and while he grumbled and declared himself worn out and unfit for his position, entailing as it did an immense amount of fatigue and hardship, it was well known that the man who could live alongside of old Ian Cameron when once his hounds had settled down to a fox, must not only be of sound wind and limb, but more active than nine-tenths of the young Highlanders in the district.

The hounds also deserve some notice before I enter upon the doings of the day. They were small, very powerfully built animals, with heads and frames much resembling the old Southern hound; and possessing a grand bell-like note; but far too slow to come up to the modern idea of a fox-hound. Indeed, except on some very rare occasions, when a fox had been caught unawares or, as it is usually termed, 'chopped,' neither they nor their immediate ancestors had ever killed one without assistance. Ian had, he told me, first got the strain from the late Lord Eglinton nearly fifty years ago, and had kept it pure from that day to this. It was, however, in terriers that the old man excelled. Talk of the prize-winners of the so-called Skye breed at the dog-shows of the present day! I very much doubt if Ian would have accepted one of them as a gift, while his specimens would no doubt have been contemptuously ignored by any well-regulated judging mind. Long-bodied, short-legged, powerful little animals they were, with rough coarse coats of the thickest of thick hair, each of them able and willing to bolt or half kill a fox single-handed. Their ancestors had originally been brought from the island of Barra, where, in common with all the western islands, the breed supposed to be confined to Skye is found of the utmost purity; and they were as perfect representatives of their class as it would be possible to find anywhere.

Their owner had arrived two days previously at the house of a large sheep-farmer with whom I was staying; and as I knew there were several foxes frequenting the cairns among the high hills, I had arranged to accompany him on this and on subsequent occasions; and I may add, that for those who both can and will run for miles over the wild tops of our Highland hills, and who care for hunting and seeing hounds working when separated from the excitement of hard riding, there are tamer amusements than accompanying a professional fox-hunter on his rounds. On this occasion we had some miles to go before there was much chance of falling in with the object of our search. The wily tods rarely came down to the low ground, where the house and stable portion of the farm were situated, preferring to keep among the almost inaccessible boulders and rocks which strewed the surface of many acres on the hill-tops, from whence during the breeding season they made nightly raids against the lambs for miles around. In winter, however, the snow drove them down somewhat, and they took up their quarters in such low-lying cairns as contained rabbits, which, with an

occasional white hare, seem to form their principal food, until the advent of spring brings them more easily captured and more toothsome victims. They by no means, however, confined themselves to any one spot, but moved about from cairn to cairn; and it was in the hope of getting on the line of some such prowler and marking him to ground that we were making our present expedition. A finer morning for hunting of any kind it would have been impossible to conceive: a warm south-westerly breeze was blowing, and the air felt more like May than February, while the few remaining clouds were rapidly disappearing, and the newly-risen sun, as yet concealed from us by the intervening mountains, was sparkling on the snow-covered summits of the hills, or pouring down through the glens in long rays of golden light on to the many lochs and woods which, intermingled with cultivated fields, formed a belt of lowlands at our feet stretching to the Western Ocean.

For nearly two hours we pursued our way, mounting higher and higher, until we reached a broad glen, shut in by very high hills, on which were some cairns much affected by the foxes. During this time the old fox-hunter had kept up a continuous stream of talk, quite regardless of the severity of the ascent, which was such in places as to render me glad of the excuse afforded by the glorious view below, for a momentary rest. His theme was foxes, and it may be imagined that after an experience of nearly fifty years he had a good deal to say worth listening to on the subject. One anecdote of a cub I remember. He had been asked by some southern laird to preserve any cubs he could catch, and to send them south to him for turning out; and one spring he succeeded in getting three. They were too young at the time of capture to bear the long journey; but after two months he put the three into a wooden box, nailed it down, and took it in a cart to the pier, some twelve miles distant, where the steamer by which he was going to send them called. A gentleman he met there told him that unless he wished the cubs to die of suffocation he had better take the top of the box off and bore breathing-holes in it; and while doing so one of them made its escape. It was dark at the time; and after a short pursuit he had to give it up as hopeless, and returned home next morning after sending off the remaining two. To his astonishment he found the missing cub comfortably ensconced in its accustomed corner, and was told by his wife that at eleven the previous evening, just three hours after the little animal had made its escape, she had heard something scratching at the door, and on opening it found the cub, much travel-stained and wet, and evidently very tired, but delighted at reaching home again. How it managed to find its way on a dark wet night over a road it had never seen, and had only once traversed shut up in a box at the bottom of a cart, is one of the mysteries of instinct; a faculty which ought rather to be ranked with reason.

On entering the glen Ian commenced to cast his hounds, which had hitherto kept to heel, from side to side; and we had hardly gone a hundred yards before they began to get busy, and in a few minutes it was evident they had got on the line of a fox. Knowing the ground well, we watched them without moving for a little while, until indeed we felt

no doubt as to the particular cairn their quarry had been making for, and then, as his line had by no means been a direct one, we had ample time to get above the hounds and, while making our own way as direct as possible, watch them as they followed him along the mountain-side. It was pleasant to see them all working together, making a cast here or a turn there, as they puzzled out the cold scent, their rich full note every now and again reaching us as one or other of them was able to 'speak' to it. Winding in and out among the small corries, but ever rising higher and higher, the tiny pack at last headed direct for the cairn, close to which we had arrived several minutes before; and whether the scent was fresher, or they were encouraged by again seeing us, every hound joined in the musical chorus.

We were standing on a small eminence close by, and as the rich bell-like notes sounded through the clear air of the mountain-tops, an old dog-fox with a white-tipped brush stole out, and before Ian could get his gun up, was well under weigh. I am glad to say that shooting straight did not form one of the old man's accomplishments, and I saw his slugs flatten themselves into great white blotches on the face of a big black rock a couple of yards behind the tod. At the same instant, with a yell which brought the hounds to my heels, I rushed after it, and only waiting long enough to see them racing away in full view, I made for the top of the hill, now not many yards distant. Ian, notwithstanding old age and white hairs, was already before me, and I had to run hard before I could get on level terms with him. The chase was for the time out of sight though not out of hearing; but after a smart run of half an hour's duration we came to a jutting perpendicular precipice, forming the angle where a smaller glen joined the main one, and far below us we could see the hounds racing without a check, while a careful search of the probable line of the tod revealed him making the best of his way to a very strong cairn on the hill exactly opposite to us. Feeling pretty certain that as he had got his mark in that direction, he would make it his point, we sat down on the brink of the precipice and watched both pursuers and pursued. The latter was evidently gaining ground, and seemed to be aware of the fact, as he was certainly not distressing himself; but the hounds were running so that literally a sheet would have covered them, and were hunting his line without even a momentary divergence; so that, however well this strong hill-fox might have proved, he would have found it no easy matter to run them out of scent. Five minutes across the glen, and another five up the opposite hill, sufficed, however, to bring him close to his stronghold; and secure in the prospect of immediate safety, he had the coolness to turn round and watch his pursuers as they toiled up behind him; disappearing from our view the moment after behind the great rock and boulders which everywhere lay scattered around.

As soon as he did so, we got up and made the best of our way across, finding the hounds mounting guard on the rock under which he had disappeared. The cairn he had taken refuge in was the strongest and largest on the property. A chaotic mass of loose boulders were strewn one above another among enormous masses of rock over an extent of some four acres; and so rough was the walking

that it was exceedingly difficult if not absolutely dangerous to attempt to cross it. Rabbits inhabited it by the thousand, and the whole mass was connected more or less by passages beneath the surface. Indeed there was nothing to prevent a fox from taking the ground on one side and bolting perhaps two hundred yards off on the other; and Ian's first care on arriving was to take his hounds round outside, to make sure that it had not done so. Satisfied on this point, he chose a position on one of the biggest rocks, and after putting his terrier in he retired there, in readiness to fire if the fox bolted. I remained down below, to follow as far as practicable the progress of the terrier. The little animal well knew its work, and plunged in under the rock with the utmost keenness. A second after, a yelp or two told that it could feel the hot scent, if it had not reached the fox; but the yelps grew fainter and fainter, and at last died away. I kept moving about among the boulders, listening at the rabbit-burrows and crevices of the rocks, and at last I distinguished the snarl of the terrier, followed at intervals by distant sounds of tearing and scratching. The combat, however, if combat it was, was taking place very deep down, and it was impossible to distinguish what was going on. By degrees also, even these sounds ceased; and as, after waiting for more than half an hour, they were not renewed, Ian joined me, and ineffectually called and whistled for his dog.

After persevering in trying to make out its position for some time, we at length desisted; and as it was necessary for one of us to go for assistance in the shape of other terriers and more men, I volunteered to undertake the task, leaving Ian to guard the cairn during my absence. A sharp run of an hour took me to the farmhouse, where the news of our having got a fox in the Gray Rock Cairn soon spread; and by the time I had bolted a few mouthfuls of breakfast, and got some grub put up for Ian, I found half-a-dozen men and three times that number of terriers and collies in readiness to accompany me back. A little over two hours saw us at the scene of action; and we heard that nothing had occurred during my absence, except that Ian felt pretty confident that he had once distinguished the sound of his terrier scraping. We had brought four others of his up with us, and these he at once turned in; while every one who owned a dog of the breed put it into some part of the cairn, and then awaited the result; the collies meanwhile contemplating the proceedings, sitting on their haunches with their ears half cocked and their heads a little on one side; pictures of canine wisdom. The terriers had not been in many minutes before a regular chorus of yelping commenced, followed by the appearance of one or two of the less courageous with their tails well tucked in between their legs, only to receive execrations in guttural Gaelic from their owners. We now set to work to move some of the smaller boulders; and, at the end of about an hour's hard work, we reached the scene of the conflict, and found the fox which we had marked to ground, and another, quite dead.

Great were the rejoicings over the death of these two of the shepherds' enemies, and loud the praises each man bestowed on his own terrier, if he was fortunate enough to possess one. In real truth, however, it was those belonging to Ian which had done the work, as they were put in

first, and not more than three could have reached the fox at one time.

On several other occasions I was out on such-like expeditions from dawn to an hour or two after dark, during which time we killed six foxes, one falling a victim to Ian's gun, and the rest meeting their death in fair fight with one or two terriers; as except on the occasion I have just related, I do not remember more than the latter number being turned in at once. We also had some capital runs with the hounds; and whatever may be the opinion of the legitimate fox-hunter, I can assure him he may have worse sport than a day on foot among our Highland hills.

W. H. D.

SMUGGLING IN ITS DROLL ASPECTS.

THE Custom-house, London, although it figures in almanacs in the list of 'places of public amusement,' is by no means a cheerful building. Situated in the extremely busy and dirty thoroughfare called Lower Thames Street, next door to Billingsgate Market, far-famed for good fish and choice language, it has few attractions for those who are not compelled by business needs to enter its portal. Here is nothing but noisy activity. Merchants' clerks, porters, car-men, and the numberless beings who form the rank and file of a vast commercial centre, elbow each other as they push through the ever swinging doors in their anxiety to get their business transacted.

Occasionally a knot of country people may be met with in the 'Long-room' staring about them in the fruitless search after anything in the shape of entertainment; but with these exceptions the place is given up to business. If these visitors were able to find their way to the Museum, they would there see much to both interest and astonish them; but this part of the building is perhaps necessarily withheld from the general public, for there seems in the busy hive so much for everybody to do, that drones in the shape of sight-seers would hardly be welcome.

Yet, the Custom-house contains a museum of real curiosities—memorials of attempts at smuggling. Various causes have contributed to the decline of contrabandism as a means of livelihood, chief among which are the necessary reductions and alterations in the Customs tariff since the adoption in this country of free-trade principles. When such valuable and portable articles as watches and lace were heavily taxed, the temptation to secrete them was naturally very common. At the same period too the duty on spirits was about five times as much as its intrinsic worth, and therefore this class of goods afforded a rich harvest to the successful smuggler. Things are changed now, for lace and watches are duty free, and the tax upon spirits has been reduced considerably more than one half. Tobacco and spirits, owing perhaps to the universal demand for them, have always, above other things, met with the smuggler's particular regard; and such cases as now come before our police magistrates are generally confined to these two articles. A matter-of-fact heavy fine and confiscation of the surreptitious goods, is the usual result of conviction; and the smuggler—which our childhood's fancy painted as a brave hero fighting the myrmidons of an oppressive government in some wild cave

on the sea-shore—is quietly walked off to prison until he can pay the forfeit. 'The Smuggler's Cave' still remains; for with that clinging fondness for the traditions of past times, it is the fashion to dignify any natural crevice in our cliffs with that title; but now the modern policeman steps upon the scene, and poetical ideas vanish with the sound of his creaking contract boots.

The chief evidence of smuggling as it has existed within the present century is furnished by certain articles which have been seized from time to time, and which are now lodged in the Custom-house Museum. It is to this Museum that we now intend to direct our readers' attention, and more especially to a certain large cabinet in the corner of the room, the contents of which supply a title to this paper. The first thing which is pointed out to us is a ship's 'fender,' which we may remind our readers is a block of wood with a rope attached slung over the bows to prevent the abrasion which might be caused by contact with another vessel. This particular fender was found to be hollow, and to contain several pounds of compressed tobacco. The officer who thought of looking for the soothing weed in such a receptacle must have been an extremely 'cute individual. But here is a still more extraordinary hiding-place, and one which must have involved a journey aloft for its detection—a ship's block, the sheave or wheel of which is actually made of solid tobacco. Here is an ornamental pedestal which once adorned the corner of a captain's cabin, and would perhaps adorn it still, had it not been found gorged with contraband cigars. Another commander appears to have been a more moderate smoker, for he was content with only two pounds of cheroots, which were found inside a sham loaf on his breakfast table. Here we have a number of cigars knotted singly on a string, like the tail of a kite; these were dropped between the inner and outer timbers of a ship's side; whilst holes drilled in the ends of an egg-box furnish lodging for several more.

A broomstick does not seem at first sight to offer much room for concealment, but here is one which, accidentally broken, revealed a core of that rope-like commodity known to those who chew the weed, as 'pigtail.' Cakes of tobacco formed to fit into the sole of a boot shew another ingenious mode of disposal. But the prize for inventive talent must certainly be awarded to the clever rascal who compressed snuff into slabs, and stamped them to exactly imitate the oil-cakes on which cattle are fattened. Whether the discovery of the deception was owing to moral objections on the part of some experienced cow to chew anything stronger than cud does not transpire; but the real nature of the food was somehow ascertained, and what might have proved the staple of a lucrative trade, was transformed into the original dust from which it sprung.

The stewardess of a Jersey steamer is the next delinquent who comes before our notice. On various occasions the petticoat has been found to be a useful auxiliary to the smuggler, and the one which was taken from this lady sufficiently proves the truth of our remark, for twenty-seven pounds of tobacco were hidden in its folds. Two more garments of the same nature contained respectively eighteen and twenty pounds of cigars; whilst another, with the help of a number of fish-bladders hanging from the waistband, was charged

with several gallons of brandy. Bladders of cognac have also been found attached to a ship's keel several feet under water. It is to be presumed that the discovery of these last was not made in the Thames, the water of that river not being celebrated for its transparency. Artificial lobster-pots thrown overboard with corks attached, also afford favourite receptacles for various articles. Another stewardess, in this case belonging to a Rotterdam boat, did a little ostensible trading in pigeons. Here is the box in which they were caged, constructed with a false bottom, below which were hidden a few pounds of Cavendish. It is a question whether birds ever before so well deserved to be called *carrier pigeons*. The journey to Rotterdam is but a short one, so that although this lady did not indulge in such wholesale doings as her sister, of Jersey, she worked on the principle that 'many a little makes a mickle.' Here is an apparently well-bound volume which a studious individual carried under his arm during the transaction of his daily business at one of the docks. It was found to be made of glass, moulded into the form of a book, and covered with leather. That it was a work of much spirit was proved from the fact that it was full of *eau de vie*. Another book is exhibited, the leaves of which are punched through with round holes from cover to cover, for the reception of watches.

We are told that the detection of most of these contrivances for concealing goods about the person has been due to the nervous trepidation of the delinquents themselves; an apt illustration of Hamlet's words: 'Thus conscience does make cowards of us all.' It would seem an almost impossible task to secrete one hundred and forty-seven watches in a single garment, but nevertheless one individual succeeded in doing so. Unfortunately he found a difficulty in sitting down, and the continued fatigue of keeping his feet during a long voyage so told upon his nerves, that fancying he was detected and watched, he gave himself up to justice, literally clothed in his own confusion. Here we have four tin boxes about an inch in depth and about two feet square, having a capacity of four and a half gallons, which, filled with spirit, were found hidden below the clothing in a passenger's boxes. But the latest contribution to the Museum is a small quantity of treacle-like fluid labelled 'Nicotine Poison.' This is a sample of a consignment lately received from Hamburg, and politely returned to the port of shipment, by order of the Customs Board. It is imagined that some enterprising genius had it in his mind to convert by its aid the refuse leaves of the British cabbage into Havana cigars. We have already had experience of Hamburg sherry and Hamburg butter, and doubtless the Customs Commissioners had these commodities in view when they rejected the persuasive overtures of the narcotic in question.

Besides the things which we have enumerated, there are various articles of interest in this Museum. Several curious old prints, shewing what the Custom-house was like in the days when the London suburbs were little villages, separated from the city by some miles of meadowland. It was then the practice of the Commissioners to ride or drive to their duties, and stable accommodation was therefore a necessary adjunct of the premises. Here too are shewn the dies

used when each outpost had its own particular seal—this was years ago, before the telegraphs and railways had so effectually lessened their distance from London. 'Leverpoole' was then a creek attached to the port of Chester; on the other hand, many towns which have now sunk into comparative insignificance, were then flourishing sea-ports of great commercial activity. Some curious records relative to the payment of officers are also well worth attention. Here we learn, by marginal notes, that certain unfortunate beings are to be deprived of their salaries, 'they being Papists;' whilst one is mulcted of his due because 'his wife is now or was lately a Papist.' These notes were written in the year previous to that which saw the landing of the Prince of Orange, and they form a singularly terse comment upon the state of public feeling which led to that event. The world is now nearly two hundred years older, and has grown more tolerant. We cannot say that it has become honest; but for the reasons already given, it is not likely that many additions will be made to the curiosities of Smuggling.

THE MONTH:

SCIENCE AND ARTS.

THE Royal Agricultural Society's *Journal*, No. 25, recently published, abounds with information likely to interest other persons as well as farmers. There is a good account of the implements exhibited at the Philadelphia Centennial Show, in which many clever contrivances are described, among them not a few shewing that Canada is by no means deficient in inventive ingenuity. Dr Voelcker in his experiments on roots explains that swedes when allowed to sprout a second time transfer two-thirds of their solid substance to their tops or leaves; and he calls attention to a series of experiments carried on in France which lead to the conclusion that 'roots mature more readily when planted closer, and often yield a heavier crop per acre, than when they are planted too widely apart.' In his chemical report the doctor exposes the trickery used in the manufacture of oil-cake, and says that he has 'considered it his duty to refer to these matters because he knows that mal-practices of cake crushers and dealers are again gradually extending all over England.' Then comes an article on the use and value of straw as food, which will surprise most readers; and next we find a Report on analysis of butter drawn up for the Board of Inland Revenue, in which the reporters state that the more butter is washed and kneaded to expel the curd the better will it be; and that 'while some of the finest and best prepared butters undergo little or no change, there is in others a gradual disappearance of the characteristic principles of butter, and a consequent assimilation to the constitution of an ordinary animal fat. This change, which appears to be due to an incipient fermentation, and is generally accompanied by the development of fungi, is probably caused either by the use of sour cream or by insufficient care in making the butter.' We only add the remark that the souring of butter is more frequently caused by

negligence in washing out the milk properly than anything else.

This seems the place to mention that a reward of three hundred marks has been offered by the Pharmaceutical Union of Leipzig for the discovery of a sure and practical method for the detection of the adulteration of butter by other fatty substances. The competing descriptions are to be sent in before September 30 of the present year.

Another article in the *Journal*, by the Rev. Canon Brereton, sets forth the advantages offered by Cavendish College, Cambridge, as bearing on the education of agriculturists. 'The time and the cost,' he says, 'of a three years' residence in College, after the school course is finished, have been considered incompatible with the obligations both of learning and earning, in the business of a farm.' But the reform of schools and the establishment of local examinations have 'not only made the general school preparation itself much more effective for after-life, but have admitted the possibility of adding to the school the further advantage of a college course, and this within the university, and in permanent connection, therefore, with the highest education of the country. In short, many a lad of fifteen or sixteen who has been taught in a good school has it quite in his reach to take a university degree at eighteen or nineteen, and then enter on his professional studies and duties with all the advantages of a completed education. To secure practically this important result, and to offer to such lads the best university instruction, with suitable protection and associates, and at a very moderate cost, the new Cavendish College is now being founded in Cambridge.'

In a recent *Month* (ante 270) we mentioned an exhaust nozzle for quieting the noise of safety-valves and escape-pipes. This nozzle has since been described in the *Journal of the Franklin Institute* (Philadelphia). It consists of a spiral coil of wire so compressed as to leave a slight space between the individual turns of the coil. This when properly adjusted is fitted into the end of the escape-pipe: the steam rushes out; but instead of communicating its vibrations to the air, communicates them to the coil. 'As, however, the individual turns of the coil cannot vibrate to any considerable extent without coming in contact with the adjacent ones, interference occurs to such an extent that the vibrations are not transmitted to the air.'

This useful invention (Shaw's Spiral Exhaust Nozzle) has been reported on by a Committee of the Institute, who in concluding their very favourable Report, recommend the grant of a premium and a medal to the inventor, and remark: 'In view of the annoyance, fright, and danger arising from the roar of escaping steam, and of the completeness with which the nozzle destroys this roar, we are of the opinion that Mr Shaw has done a great service to the community, and particularly to the transportation interests, in overcoming an obnoxious and dangerous feature in the use of steam.' The nozzle, we are informed, has already been largely adopted in America. Shall we have long to wait for its introduction here? People who dwell in the neighbourhood of factories and thousands of travellers, are ready to give it a welcome.

Steam-power for tramways instead of horse-power continues to be a subject of experiment,

with a view to prevent noise and escape of steam, so that passengers may not be deafened nor horses frightened. It was stated at a meeting of the Institution of Civil Engineers, that the best form of tramway is that which has the rails laid on continuous wooden sleepers, and that there will not be so great a saving as is commonly supposed by using steam instead of horses, for the repairs of the engines will be a heavy item of expense, and the engine-fitters and drivers will require high wages. Some inventors dispense with steam and make use of compressed air; and mention was made of 'a pneumatic car designed by Mr Scott Moncrieff which had been at work on the Vale of Clyde tramways. It carries one hundred cubic feet of air at a pressure of three hundred and fifty pounds on the square inch; and considering that everything about it was of a rough and temporary character, the success obtained was encouraging.' As regards capability, we are told that 'on the level, and on gradients up to one in thirty, engines can do all that is necessary. But the engine has yet to be designed which will stop and start again, with a heavy car behind it, on any steeper inclination without trouble and delay.'

On the other side of the Atlantic, a different conclusion has been arrived at, for, as stated in the *Journal of the Franklin Institute*, a steam tramway engine has been tried in Baltimore which, with a load of a hundred passengers, can be easily stopped and started on a gradient of seven feet in the hundred, or nearly three hundred and seventy feet per mile. It drew the same load through snow and slush ten inches deep, when four horses were required to draw an ordinary car. This engine weighs sixteen thousand pounds. On suburban roads it travels at from twelve to eighteen miles an hour. Compared with a two-horse car, it shews, in its working expenses, a saving of five hundred and fifty-eight dollars in a year. The power of traction is, however, of less importance than the absence of smoke and of noise from the steam that is employed. Several good specimens of smokeless and noiseless tramway engines have been shewn in this country.

A horseshoe which is described as 'partaking of the moccasin and also of the sandal' has been brought into use at Philadelphia for street traffic, with, as is said, satisfactory results. It is hollow on the under side, and the hollow is filled by a piece of tarred rope, which by deadening concussion, lessens the severity of the horse's labour and the wear of the paving-stones. This shoe is put on cold, and requires not more than six nails to hold it in place. Something has been heard too of a shoe made of compressed sole leather chemically treated, which is lighter and more lasting than iron shoes; but of this we have as yet no particulars. Lightness should be a recommendation; for if a set of shoes weigh two pounds and a horse trots one step every second, he will lift one hundred and twenty pounds in a minute; from which the sum-total of weight lifted in a day's work may be calculated. When farriers and all people who keep horses shall have some real knowledge of a horse's foot, then proper horseshoes may be expected to come into general use.

Mr Outerbridge of Philadelphia has succeeded in producing by precipitation gold-leaf so thin that with a single grain he can cover nearly four feet of surface. Nearly three million of such films would

be required to make an inch in thickness. The films are not, as might be supposed, patchy, but are perfectly whole and continuous: they are also transparent, and serve to illustrate the green appearance of gold under transmitted light.

A good example of the economy of fuel effected by the use of compound cylinders is to be seen in Cherry's Compound Steam-pumping Engine, which has been recently exhibited at Birmingham and at Falmouth. With four pounds of coal hourly for each horse-power, this engine, when fixed in a mine, will force water from a depth of more than a thousand feet; and it is of course applicable to overground work as well as underground work. The characteristics, as described in the Report of the Royal Cornwall Polytechnic Society, are 'extreme simplicity, the reduction of friction to a minimum, thorough efficiency of expansion;' and the entire cost of the engine will be less than the cost of the foundations for an ordinary pumping-engine.—With this may be noticed Stevens' patent underground Hauling Engine, which is so compact that it may be placed almost anywhere in a mine, requires no foundation, may be spiked to a piece of timber or wedged to the roof, and is not affected by the moving of the floor, which is not unfrequent in mines. Another advantage is, that it requires but a few hours to get it into working order, and may be driven by steam or compressed air at pleasure.

A common objection to ordinary fireplaces is too much of the heat wasted up the chimney, and various contrivances have been tried to prevent this waste, one of which was an iron plate instead of bars for the bottom of the grate. An improvement on this is Wavish's patent Coal Economiser, which has a hollow-pierced cylinder rising from the middle of the plate. The air entering the cylinder from below the grate is thus conveyed at once into the centre of the fire, and the heat, instead of rushing up the chimney in undue quantity, is diffused into the room, and coal is economised. The perfection of combustion is achieved when, instead of feeding the cylinder with the vitiated air of the room, it is fed by a pipe communicating with the external air. And further, we are informed that 'if a bag of camphor or other disinfectant is hung on the cylinder, the scent is driven into the apartment;' and thus any room in a house may be perfumed, disinfected, or ventilated by this contrivance, when properly fitted.

Among recent patents is one granted to Professor Sir William Thomson for 'improvements in navigational deep-sea soundings.' With this apparatus a sounding can be taken without stopping the progress of the vessel, which is in itself an important advantage. The depth is indicated by appearances in a glass tube, which shew what portion has been occupied by air while under pressure beneath the water. A Frenchman has invented a sounding apparatus which consists of an india-rubber bag filled with mercury communicating with a valved metallic chamber. The pressure of the water forces the mercury into the chamber, and the quantity therein denotes the depth.

Hitherto the electric light, though a brilliant and powerful substitute for sunshine, has resisted the attempts made to bring it into general use. Clockwork has been required to keep the carbon

points always the same distance apart, and as carbon wastes by burning, there was too often failure on the part of the wheels. But now Mr Jablochhoff, a Russian military officer, has discovered a way of overcoming the difficulty. His source of light being a magneto-electric machine, strong enough to produce, say, twenty minor lights, he connects the points where these are to be placed with the principal machine by means of wires. At each of those points he fixes an 'electric candle,' composed of two strips of carbon, and a central strip of a fusible and insulating substance described as kaolin. The current flowing from the machine passes up one of the carbon strips of the first candle, appears as a steady light at top, passes down the other strip, and so on to each candle in succession, and returns to the machine from the last of the series. The candles burn about an hour; but as four are fitted to each lamp, and take light one after the other, an uninterrupted illumination of four hours is thus provided for.

This method has been tried with approbation in Paris, and in London at the West India Docks. Gas appeared dull and feeble by contrast, and the onlookers came to the conclusion that by aid of the electric light the loading or unloading of ships could be readily carried on at night. A further advantage is, that the light is portable, and can be taken without danger into the hold of a vessel. Thus by subdividing a single current and leading each division to a 'candle,' it seems that the question of utilising the electric light is likely to be solved.

Mr C. Meldrum, F.R.S., Director of the Observatory at Mauritius, devotes much time to observation and discussion of sun-spots, rainfall, and cyclones. After carefully considering and comparing observations made in all parts of the world, he finds them corroborated by those of his own locality, and that there is a decided and apparently persistent difference between the rainfall of the period of most sun-spots and of fewest sun-spots: the law being, the more spots the more rain. He finds further, that the increase and decrease have recurrent periods, that there are cycles of rainfall, of sun-spots, and of cyclones; and he remarks: 'Although the question has been brought forward simply by way of hypothesis, yet it appears to me that, on the whole, the evidence in favour of a connection between sun-spots, cyclones, and rainfall, is so strong that any doubts or uncertainty that may now exist will soon be dispelled. . . The hypothesis does not require that the years of fewest spots must necessarily be years of drought, and those of most spots necessarily years of torrential rains over the whole earth. It merely requires that the rainfall of the globe should be subject to a variation having a period of the same length as the sun-spot period. Observation shews, however, that the years of fewest sun-spots are those in which severe droughts are most to be feared.'

'It would be a hopeless task,' continues Mr Meldrum, 'to try to convince those who judge of the matter only by their sensations, that less rain falls over the globe in some years than in others. Great floods and great droughts, especially floods, make deep impressions on the mind, particularly on the minds of those who may have suffered from them. If in a certain year a man was ruined by

a succession of floods, and in another by a succession of droughts, it might be hard to persuade him that, generally, the former was a remarkably dry year, and the latter a remarkably wet one. The opinions of people who trust to their sensations in a question of this kind, are swayed from side to side by every change of weather. It is only by taking annual averages for many places and many years that the truth comes out.

Papers bearing on this question were read during the past session at the Royal Society, shewing that by careful observation of the periodical phenomena above mentioned, it would be possible to foretell and provide against the calamitous seasons of famine which occur in India. This would indeed be a beneficent application of physical science; but the results of observation are not yet sufficiently definite. General Strachey, F.R.S., read a paper to prove, by a negative process, that 'there has been no sufficient evidence adduced of any periodicity at all.' Thus the question remains open to further observation and argument, of which there will be no lack; but we may anticipate that a profitable direction will be given to both by the new Council appointed by the Treasury to govern the Meteorological Office. This Council comprises the Hydrographer of the Admiralty, and five Fellows of the Royal Society eminently qualified to deal with scientific questions and direct the work of the Office.

A FIJIAN TRAGEDY.

THE following sad story is correct in its details; it occurred within the writer's ken, and may serve to illustrate how English civilisation and laws affect the Fijian mind and mode of thought. About four years ago Ravuso Ioni was the principal chief of Waia, one of a group of islands the most westerly in Fiji, called the Yasawas. About that time the parvenu Fijian government had just been formed; and we planters and natives were blessed with a travesty of English laws and institutions down in the Yasawas: one of our planters was made a warden, a court-house was established, and a posse of native police sent down. It need hardly be said that these proceedings were a mystery to the natives; and even close to Levuka, the more enlightened of them could at first hardly be brought to understand the idea of any government. At all events, Ravuso troubled himself very little about the new *nata-ni-tu*, as the government was called by the natives, but carried on in the old Fijian style of his fathers. Now there was a young man in Waia who made love to all the young girls; and not content with that, he also paid his attentions to the married women. The Fijians are a jealous lot; and by-and-by a mob of angry husbands complained of this young fellow to their chief Ravuso, who, with the advice of the old men in full council, decided that this gay lover was to be *buturaka-ed*, or turkey tramped as we whites call it. This *buturaka-ing* is an institution peculiar to Fiji. The unfortunate is knocked down; and the natives dance and jump on him until he is insensible and nearly dead. A man seldom recovers thoroughly from a good, or rather a bad, *buturaka-ing*.

Some, doubtless, of the jealous husbands or their friends were among the party that *butu-*

raka-ed the gay deceiver, because they carried out their orders so well that in three weeks after the young fellow died from the effects.

In the old times, most of us whites and natives would have said: 'Serve him right,' and the matter would have ended. But now there was law in the land; our warden was just appointed, and, new-broomish-like, ordered the arrest of Ravuso. After some trouble, he was coaxed to surrender, and was confined at Somo-Somo, awaiting trial. Nothing so puzzles a Fijian as the slow procedure of our English law; and poor Ravuso pined in prison. So one day he asked his *Ban* (jailers) to be allowed a walk: they accompanied him; and all sat down under a large *ivi* tree. After a time the chief proposed to get some *ivis*, and climbed the tree for the purpose. When he got to the top, he called out to his astonished guards that he was going to throw himself down headlong. 'Tell your white judge,' said he, 'that I am a chief and the son of a chief; that I can't survive the disgrace of being imprisoned like a felon; that the punishment given to the man of mine was just—he was a bad man; that I am a chief, and had a right to punish him *vaka-viti*' (after the manner of Fiji). So saying, he threw himself down, broke his back, and died shortly afterwards.

In a day or two the news of the chief's death reached Waia, and a wail went up from each little village embowered in its cocoa-nut grove, for the death of their 'Turaga,' as they call their chiefs. His wife, Lau Wai (to strike water as in fishing), and young daughter (fifteen years only) made up their minds that their chief should not go unaccompanied to Hades, but have some one to cook and look after him there. So one night they tied a rope between two trees, twisted it round their necks, and so strangled themselves after the old Fijian fashion. These people had been Christians ten years, but evidently believed in their old traditions still. Our warden was not a bad fellow, and I believe the unfortunate result of his first attempt at enforcing English law among the natives caused him many a pang.

And now the sad tale of the death of this unfortunate Waia chief and his family is told in many a Fijian hamlet, in the cool evenings, as the sun goes down under the shade of the lofty *ivis* and cocoa-nut trees; and the women and children hear with a thrill of the power of that mysterious *mata-ni-tu* whose action hurled a Fijian chief from his high estate, and sent him and his devoted wife and daughter prematurely before the face of their Maker.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the 'Editor, 330 High Street, Edinburgh.'

2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.

3d. Manuscripts should bear the author's full CHRISTIAN name, surname, and address, legibly written.

4th. MS. should be written on one side of the leaf only.

5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

PREDOMINANT DELUSIONS.

SEEING is believing! Such is an old saw, not usually called in question, and yet it is exceedingly fallacious. A great many phenomena seemingly true by the eyesight are not true at all. Ignorance and prejudice have led to very extraordinary mistakes. We speak of the sun rising and setting, because it appears to do so, but it neither sets nor rises. The earth turns in front of it like a roast turning before a fire. A conjurer will clearly shew you that he will bring any number of eggs out of an empty hat. He only brings them out of his sleeve, where they were cunningly concealed. And so on with a great many other illusions, all seemingly fair and above board, but in which we are imposed on either by our senses, or by some fallacy in reasoning. Less than two hundred years ago, courts of justice were hanging and burning thousands of old women for being witches—all on a sort of evidence which in the present day would only be laughed at. The world now knows better than believe such trash, but it took a long time to learn; and even yet this highly experienced and much complimented world occasionally falls into the most absurd crazes; or perhaps we should more correctly say, there are large numbers of tolerably educated but credulous people who with a taste for the wonderful are ever ready to believe in any kind of nonsense that turns up. These worthy individuals are, of course, not without excuse. Starting with the principle that there may be forces in nature which science has as yet failed to disclose, we should be cautious in asserting that any particular phenomenon that seems incomprehensible is a result of mere illusion or imposture. Let every mysterious demonstration, they say, be impartially inquired into. Quite correct. The misfortune, however, is, that before the matters in question have been examined impartially by the light of science, the craze gets ahead, and many persons weakly allowing themselves to be carried away by their feelings, get painfully compromised, and are by the more cool and cautious part of mankind set down as little

better than—fools. Very hard! But the warning offered is useful. If people of good standing will believe in absurdities without proper examination, they must take the consequences.

We have been led to make these remarks by a perusal of the lately issued work, *Mesmerism, Spiritualism, &c., Historically and Scientifically considered*, by Dr W. B. Carpenter. In this ably written and eminently readable small volume, the author brings to bear a long experience in scientific inquiry into the popular crazes and impostures of the last forty years, beginning with Mesmerism and Table-turning, and ending with Spiritualism in the several shapes it has assumed. We commend the book to the serious consideration of the credulous. Tracing the history of marvels of different kinds, Dr Carpenter states that the whole has been 'a long succession of epidemic delusions, the form of which has changed from time to time, whilst their essential nature has remained the same throughout; and that the condition which underlies them all is the subjection of the mind to a dominant idea. There is a constitutional tendency in many minds to be seized by some strange notion which takes entire possession of them; so that all the actions of the individual "thus possessed" are results of its operation.' Placed on this footing, the Predominant Delusion, be it a belief in witchcraft, mesmerism, or spiritualism, is a kind of monomaniacal frenzy. An absurd idea has got possession of the individual, and no reasoning with him to the contrary will have any effect in driving it out. He will absolutely get out of temper if his fanciful notions are so much as questioned. Usually the monomania spreads; and the more who suffer themselves to be affected, the keener and more demonstrative does the delusion become. Certain frantic religious ferments in past and recent times have been due to nothing else than strange contagious influences, of which, after a time, when passion has subsided, all are pretty well ashamed, and fain to stifle out of disagreeable remembrance. We happen to have seen several of these prevalent crazes, droll in some respects, but very pitiable. After such mental disturbances, things, happily,

shake themselves right at last, and all goes on as usual. The fever has subsided.

Often, able and estimable men suffer themselves to be affected by the prevailing craze, and lead on others as imitators. It is now about forty years since, when by invitation to a friend's house, we were present at an evening *séance* in which an eminent professor at one of our universities entertained the company with what he confidently believed to be mesmeric experiments, such as sending persons to sleep, or rendering them temporarily mute by bidding them 'tie their tongue.' Here was a man skilled in a branch of physical science, but of eager temperament and with a rage for novelty, lending himself indiscreetly to certain popular delusions which had originated in the crazed fancy of a charlatan. Mesmeric experiments of this sort were for a time a favourite amusement. They reminded us of the superstition in the old legends, in which 'glamour' is said to have been cast over weak-minded individuals. This ancient glamour consisted in producing by looks and gestures a negation of self-assertion. The operator threw the patient into a kind of spell-bound or dreamy condition without any power of correct reasoning. It was the conquest of the strong and resolute will over the weak and irresolute, through the effects of a kind of jugglery.

Mesmeric sleep, as it is called, is ordinarily produced by seemingly mystic passes of the hands, and an intense concentration of looks on the eyes of the person operated upon. In it there is nothing marvellous. Dr Carpenter explains that it 'corresponds precisely in character with what is known in medicine as "hysteric coma;" the insensibility being as profound while it lasts as in the coma of narcotic poisoning or pressure on the brain; but coming on and passing off with such suddenness as to shew that it is dependent upon some transient condition of the sensorium, which, with our present knowledge, we can pretty certainly assign to a reduction in the supply of blood caused by a sort of spasmodic contraction of the blood-vessels.' This explanation, on a physiological basis, considerably reduces the mystic character of those mesmeric marvels in which the late Dr Elliotson indulged at his public *séances* in Conduit Street. It does not, however, as we imagine, detract from the medical value that may be attached to the calming of the nervous system by what is spoken of as mesmeric sleep. Mr Braid, a practising surgeon in Manchester, ingeniously fell on the device of producing a profound mesmeric slumber by simply causing individuals to fix their gaze determinedly at a cork stuck at the top of their nose. It was not surprising that people should have been lulled by being subjected to this species of Hypnotism. Ordinary sleep may in most instances be induced by keeping the lower extremities perfectly still, and determinedly fixing attention on the act of breathing through the nostrils. Speaking from

experience, we offer this as a hint to the habitually sleepless.

In the amusing book before us, the author shews how clairvoyants have imposed on public assemblies by tricks, which could be seen through by sceptical observers. Miss Martineau, as is well known, had a profound belief in the marvels of mesmerism. This lady had a servant, J., to whom was imputed wonderful powers of clairvoyance. On one occasion, while in the mesmeric sleep, she gave 'the particulars of the wreck of a vessel, of which her cousin was one of the crew; as also of the previous loss of a boy overboard; with which particulars, it was positively affirmed by Miss Martineau, and believed by many on her authority, that the girl could not have been previously informed, as her aunt had only brought the account to the house when the *séance* was nearly terminated. On being asked, says Miss M., two evenings afterwards, when again in sleep, "whether she knew what she related by hearing her aunt telling the people below," J. replied: "No; I saw the place and the people themselves—like a vision." And Miss Martineau believed her! After all, the girl was proved to be an impostor. A medical friend, on making a rigorous investigation, discovered 'unequivocally that J.'s aunt had told the whole story to her sister, in whose house Miss M. was residing, about *three hours before the séance*; and that though J. was not then in the room, the circumstances were fully discussed in her presence before she was summoned to the mesmeric performance. Thus not only was J. completely discredited as a seer, but the value of *all* testimony to such marvels was seriously lowered, when so intelligent a witness as Harriet Martineau could be so completely led astray by her prepossessions as to put forth statements as facts, which were at once upset by the careful inquiry which she ought to have made before committing herself to them.'

A preconceived determination or proneness to believe in the reality of any seeming marvel without any other evidence than the senses, goes a great way to explain the stories that are fondly cherished by the dupes of spiritualism. The error lies in taking things for granted. At one time people were all agog as to the wonders of table-turning, and it is amusing to remember how the wonder was speedily exploded by the appliances suggested by Faraday. He conclusively shewed that the operators, however honest, unconsciously exerted a muscular action, causing the table to turn in the direction previously conceived. The whole thing was a curious piece of self-deception. Dupes of spiritualistic manipulators are similarly self-deceived. They go to *séances* in the fond hope of seeing incomprehensible marvels by 'mediums' and table-rappers, and come away believing that all has been real, instead of being only tricks worthy or unworthy of a conjurer. Certainly, at no *séance* of spiritualists have the performances excelled the wonders effected by those adepts in conjuring, Maskelyne and Cooke.

Although exploded and discredited, table-turning has latterly come up in the new form of planchette, a fashionable toy alleged to be endowed with singularly mystic qualities. Consisting of a small and easily moved board, in which a pencil is stuck with the point downwards on paper or slate laid on a table, the machine is said to be

capable of answering questions put to the operator who presses on the board with his hands. No doubt, the pencil will write answers as required, but it does so only by the conscious or unconscious muscular action of the hands on the board. This weak device of pretending to get answers to questions by the agency of an inanimate piece of wood and a pencil, has been resorted to by real or sham believers in spiritualism; and we are presented with the melancholy spectacle of decent-looking ladies and gentlemen sitting gravely round a table affecting to hold a conversation with beings in the unseen world.

Just as mesmerism lost its reputation as a branch of psychology, so has spiritualism begun to be estimated at its true value. It was always very much against it, that its professors held their séances in darkened apartments, and that for the most part they took money for the display of their wonders. The thing became a trade, and so it would have continued but for the prosecution and conviction of persons who stood guilty of imposture, and of taking money under false pretences. To add to the discomfiture of trading spiritualists, their tricks have been exposed in the book, *Lights and Shadows of Spiritualism*, by D. D. Home, who, however, lets it be known that he is among the few genuine professors of the art whose operations are alleged to be beyond suspicion! As shewn by Dr Carpenter, deception is not confined to those who practise for gain. He speaks of young ladies who take pleasure in imposing on elderly persons by tricks of an ingenious kind. 'I could tell,' says he, 'the particulars, in my possession, of the detection of the imposture practised by one of the most noteworthy of these lady-mediums, in the distribution of flowers which she averred to be brought in by the "spirits" in a dark séance, fresh from the garden and wet with the dew of heaven; these flowers having really been previously collected in a basin up-stairs, and watered out of a decanter standing by—as was proved by the fact, that an inquisitive sceptic having furtively introduced into the water of the decanter a small quantity of a nearly colourless salt (ferrocyanide of potassium), its presence in the dew of the flowers was afterwards recognised by the appropriate chemical test (a per-salt of iron), which brought out "Prussian-blue."'

Other instances are presented of deceptions practised in private séances; but for these and much that illustrates the whole tenor of the delusion, we must refer to the work itself. We restrict ourselves to quoting only one, but a very pertinent remark: 'It is affirmed, such exposures prove nothing against the genuineness of any new manifestation. But I affirm that to any one accustomed to weigh the value of evidence, the fact that the testimony in favour of a whole series of antecedent claims has been completely upset, seriously invalidates (as I have shewn in regard to mesmeric clairvoyance) the trustworthiness of the testimony in favour of any new claimant to "occult" powers. Why should I believe the testimony of any believer in the genuineness of D's performances, when he has been obliged to admit that he has been egregiously deceived in the cases of A, B, and C?'

For this instructive and admirably written work, offering a lucid philosophical explanation of the source of Predominant Delusions, which are apt to be turned to a bad account by the designing, and

are in every sense mischievous, as conveying erroneous notions of natural phenomena, the learned author deserves the hearty thanks of the community. W. C.

THE LAST OF THE HADDONS.

CHAPTER XXXV.—A TWELVEMONTH AFTER.

A GLORIOUS morning, in early August. I was standing in a large cheerful room, from the windows of which was an extensive view of beautiful country, hill and dale, clothed with the rich ripe fullness of fruit-time, while to ear was borne 'the distant cries of reapers in the corn—all the live murmur of a summer day.'

I was attiring myself—or I ought rather to say being attired—for a wedding, attended right royally, no less than twenty handmaidens hovering about me, each eager to do something towards my adornment; and each as desirous that I should look my very best as I was myself, which is saying a great deal. Never was slave of fashion more anxious to make an effective appearance than was I on this bright August morning. But even I began to be satisfied as the process of adornment went on, and I was gradually transformed from a sober brown chrysalis into a brilliant butterfly. A bright blue silk dress, an elegant lace cloak, white bonnet with blush roses, &c. &c. Everything, be it understood, of the very best that money could buy, and made in the latest mode, there not being a sombre colour or faded shred about me. 'All new and fresh and bright, as befits a butterfly!' I ejaculated, contemplating myself with a glad smile.

And then there was the one thing—ah, I knew it now; my prayers *had* been answered! Even allowing for the flush of excitement, this was not the face of a twelvemonth ago smiling gaily back at me from the dressing-glass. The eyes had lost their mournfulness, the mouth had become used to smile, and the whole face was full of life and colour. 'Yes; it all matches beautifully,' I acknowledged, in smiling assent to the exclamations of my attendants. 'But I require care, you know,' as they all pressed about me; 'not a rose must be crushed. And it is to be hoped that I shall not forget that I wear a train, and spoil the effect by falling over it;' which raised a laugh amongst my handmaidens, as royal wit should. Then being pronounced 'finished,' I went out into the gallery, and descended the broad staircase (my home was one of the finest old mansions in Kent) with my train about me. In the long room I was met by Jane Osborne, who, after examining me very critically from head to foot, was graciously pleased to add her testimony to that of the rest, and pronounce that I should do. I was nevertheless obliged to call her to order in a little aside for a certain trembling of the voice and moisture in the eyes—a weakness not to be looked over in Jane Osborne.

'God bless you, Mary! By five o'clock, remember.'

I just touched her lips, since she would have it so, notwithstanding my pointing it out to her that it was not a time for sentiment; and then with her hand in mine and attended by my train, I went into the court-yard, where my carriage awaited me.

'It couldn't have been grander if it had been created out of a pumpkin!' I whispered to Jane.

She looked uneasily at me. 'Do not try to jest, Mary,' she replied anxiously.

'Why not? if I feel equal to it, you foolish person!'

'Are you equal to it, Mary?'

'Quite. If I had doubted it before, I knew when I saw myself in the glass this morning. You ought to be able to see the difference.'

'Yes,' she murmured, 'there is a difference. —You will find the flowers in the carriage, Mary.'

I stepped in, and was swiftly borne away, amidst—I had almost written a flourish of trumpets, so very loud and shrill were some of the voices shouting all sorts of good wishes after me.

I flattered myself that the effect was very telling indeed, when my equipage, with its spirited horses and coachman and footman wearing large breast-plates of flowers, drew up before the porch of the pretty little ivy-covered vale church. I was received by the beadle and pew-opener with due respect, and found that I was in very good time. The gentlemen and some of the guests were already in the vestry, said the pew-opener; and in the porch were waiting two pretty young bride's-maids, who eyed me rather curiously. They had just time to remind me that my place was with the guests inside the church, and I to reply that I preferred waiting there, when a carriage of much more modest pretensions than mine drew up, and the two I waited for stepped out.

'Mary, Mary!' ejaculated Lilian, springing towards me with outstretched arms, forgetful, as I even then had the nerve to remind her, of our finery. What would become of me if I gave way now? 'Mary, Mary!'

And no sooner had I released myself from Lilian than there was my dear old Mrs Tipper giving me a good honest hug, utterly regardless of appearances. And as to finery! she had long ceased to allow that to interfere with her love, and was not to be daunted by any such consideration now.

The little bride's-maids, who were very carefully guarding their laces and muslins, reserving themselves for the right moment, looked with much disfavour at an ebullition of feeling at the wrong point in the ceremony; and now reminded us that it was half-past eleven, and that the clergyman and the other guests had been waiting some time. At which, with a meaning look at me, Mrs Tipper put Lilian's hand into mine, and we two passed up the aisle together, whilst the dear little woman walked after us with the bride's-maids, notwithstanding their whispered protestations that it was 'wrong—altogether wrong—and the effect was quite spoiled!'

As Philip turned to meet us, I put his bride's hand into his with a smile which appeared to satisfy even him. Moreover, Robert Wentworth's face brightened, and Robert Wentworth's critical observance had been anticipated with some little anxiety.

Lilian's uncle, the father of the bride's-maids, was to 'give her away'; he looked not a little curiously at the person whose appearance seemed to cause so much sensation; but his curiosity did not affect me.

At the words, 'Who giveth this woman to be married to this man?' Major Maitland gave the necessary response; but both bride and bridegroom turned their eyes upon me, as though the gift were mine.

As soon as the ceremony was over, Philip and Lilian turned towards me; and for a few moments we three gave no thought to the *convenances*, as we clasped hands and murmured a few words meant only for each other. Then the rest of the party gathered about the bride and bridegroom, and I became conscious of the presence of others that were known to me: Philip's brother Mr Dallas, and his wife, and Mrs Trafford and her sister-in-law Mrs Chichester. Marian Trafford was gorgeously attired in what no doubt was the latest Paris fashion; although I think that even she was conscious that her splendour did not eclipse mine. They had not evidently expected to see me there, and both, I felt, watched very curiously for any slight giving-way upon my part. But if I could calmly meet Philip's eyes, it may be imagined that I was proof against the scrutiny of either Marian Trafford or her sister-in-law. And Mrs Chichester's softly spoken little aside: 'Did not I think that the bride and bridegroom were an admirably matched couple, even to age—eighteen and thirty was just as it should be; was it not?' was assented to with a cheerfulness which did not seem to gratify her as a looker-on might have expected it to do.

There was only one shadow on the bride's lovely face, and that came when she signed her name; and perhaps it was natural enough that Major Maitland should frown at the remembrance of the wrong done to his sister. But it was the last time Lilian would be so pained, and she was not allowed time to dwell upon it now.

When we stood aside for her and Philip to pass out, she caught my hand and drew me with them, and in that very unorthodox fashion we left the church and entered the carriage—'Mury's carriage,' as Lilian termed it. There not being room enough at the cottage, the breakfast was to take place at Hill Side, and we were driven there—so far as a carriage could convey us—for we had to alight at the foot of the hill and walk the remainder of the distance.

As soon as we reached the plantations, Lilian took my face between her hands and gazed at me with anxious tender eyes. Then, with a deep-drawn sigh of relief and a radiant smile she murmured: 'It was true, Philip; she is happy!'

'Yes; thank God!' he ejaculated.

I made it the occasion for a little jest about my truth having been doubted; and by that time some of the others had come up with us, when the bride naturally absorbed all the attention, and the rest was easy. It was the first wedding-breakfast at which I had been a guest, and therefore I was not *au fait* in such matters. I can only say that if there were any little divergences from the etiquette proper upon such occasions, they were unobserved by me. I knew that the two I most cared for in the world were made happy, and that all the rest of us were pleasant with each other, as befitted wedding-guests. I was afterwards told that the bride's-maids thought that they had not been sufficiently considered in being only provided with one gentleman, and he so grave a one as Robert Wentworth. And Philip's brother and his wife were

said to be very stiff with us all; whilst Major Maitland was more anxious than it was polite to be to catch an early return train, reminding his daughters that *they* must not be the cause of his losing it, and so forth. But I looked through rose-coloured spectacles, and it seemed all flowers and sunshine to me.

Dear old Mrs Tipper and I sat together; and it did me not a little good to feel the eloquent pressure of her hand, which she now and again slipped into mine as the breakfast went on. I am, to this day, not quite sure how much Mrs Tipper knew of the truth; but I saw that she at any rate guessed something of it, when, in a tremulous voice, she whispered a few words about my having given happiness to her child.

I tried a little jest about still having enough and to spare.

'Yes, my dear; that is the best of it; you really are happy. Thank God, you are reaping'—

I hurriedly commenced asking questions about Becky, who, as I had so much hoped she would, was about to become the wife of Tom. He was engaged for the garden at Hill Side, and it was arranged that he should live with his wife at the cottage. Mrs Tipper elected to continue her cottage life; and as she had become very much attached to Becky, she was very glad to adopt my suggestion, that the married couple should live with her.

It must not be supposed that I was ignorant of anything which had transpired during my absence. I had regularly corresponded with Lilian, although I held firm to my first resolution, not to return amongst them again until Philip and she were married, and so brought about the event at an earlier date than it might otherwise have taken place. I need not say that Becky proved a firm ally, and faithfully kept my secret. Faithful Becky! how difficult it was for some time to get her to talk about her happiness to me! This first day of my reappearance, I inquired in vain for Becky; she was not to be found. I only caught sight of her once when I was leaving Hill Side, watching me from the back staircase, her eyes and nose bearing eloquent witness to violent emotion; but when I turned to speak to her, she sped away as fast as her feet would carry her.

As soon as might be, the bride slipped away with Mrs Tipper and me, to the increased disapprobation of the bride's-maids, who prided themselves upon being acquainted with all the proprieties for such occasions. But it was not to be expected that we could allow two comparative strangers to act as tire-women to our Lilian; and we carried her off, regardless of the murmurs about its being 'all wrong—quite wrong!' and so forth.

Once alone together, we three behaved—well, I will say as any other three women who love each other and are not above having feelings might be expected to behave under such circumstances. I contrived to satisfy Lilian, as I had satisfied her aunt, that I was no unhappy martyr, as she asked me question after question, eyeing me with wistful loving eyes.

'And you will not desert us again, Mary?'

'No; I will not desert you again, Lilian.'

'It is quite delightful to see her like this—quite a grand personage, with a fine carriage and livery servants and all the rest of it; isn't it, auntie? I may now confess, Mary, that I have been the

least bit afraid that your talking about living in a grand old house with a number of attendants to do your bidding, was'—

'Was what, goosy?'

'Too much like a fairy tale; and you know you used to talk like that sometimes, when you—when I have fancied that you were not quite happy.'

'Are you satisfied at last, dearie?'

'Yes, I am—yes, quite. You look really happy.'

I mentally offered up a thanksgiving, as she went on: 'But of course I am longing to know how it all came about. Recollect, you have promised to explain everything very exactly in your first letter. Recollect too that I leave dear auntie to your care; and of course we shall expect to find our sister here on our return.'

I promised; and when we presently conducted the bride in her travelling-dress to the drawing-room, she was looking happy enough to satisfy Philip, who, I noticed, glanced anxiously from me to her as we entered.

We all went down the winding path with them to the carriage waiting in the road below; and sent them off with all sorts of merry speeches and good wishes and the orthodox accompaniment of old slippers.

THE LAND OF THE PHARAOHS.

Time past lends to Egypt a charm more entrancing than its cloudless skies and delicious climate. Go where you will, antiquity meets you at every turn. Around you lie the ruins of cities whose very names have been obliterated in the silent march of the ages. Before you flows the sacred river upon whose waves floated centuries ago the little ark of the outcast Hebrew infant, and the golden barge of the gorgeous daughter of the Ptolemies. Time was when this old Nile was the highway down which many successive nations rushed to conquest: for the Ethiopian, the Assyrian, the Persian, the Roman, and the Saracen have all lorded it in turn in this ancient realm of the Pharaohs. Now vexed no longer with the fleets of rival monarchs, the mighty river rocks with slumberous swell the lotus lilies on its tranquil breast; and on its lonely banks, which have rung so often in days gone by to the shrill pæans of triumph, the palms in the sultry noontide throw their long shadows athwart ruined temples and colossal statues, grand in execution and faultless in detail, which reveal in every outline the perfection to which the arts of architecture and sculpture were carried in this their earliest cradle. The soil is strewn with fragments of broken columns and defaced colossi. Buried beneath the drifting sand of the Desert lie the glorious and yet grotesque masterpieces of the Egyptian chisel. Serene, grave, majestic, inundated with a flood of harmonious light, the calm features of the once inscrutable Sphinx look down upon us, as many centuries ago, they looked down in their grand repose upon the wondering Father of History. Time has pressed lightly on these Titanic temples and vast tomb palaces, but from their shadowy portals the worshippers have gone for ever. Desolate and state-fallen, they open now only to admit the curious stranger.

In *A Thousand Miles up the Nile*, by Miss Edwards, we have a lively gossiping description of the Egypt of to-day with its wasted temples and ruined palaces. Cairo—where Miss Edwards tells

us she arrived in the end of November 1873, with a party of friends in pursuit of dry weather—is a picturesque city. Seen from a distance embowered in gardens of the richest green, it looks like a forest of minarets and domes intermingled with palm-trees and acacia groves. The streets, as is always the case in eastern cities, are narrow and intricate; but their gloom is enlivened by a series of gorgeous bazaars, where the little pigeon-holes of shops are bright with many-hued carpets, and gay with delicately tinted silks, and glittering tissues of gold and silver. Here you can buy precious stones of varied value, and bracelets and collars of intricate and complex designs, such as were the fashion thousands of years ago at the court of the Pharaohs; or invest, if you choose, in a variety of warlike weapons, inlaid with gold and silver, and damascened with exquisite arabesque patterns.

The busy crowd passing and repassing the while, presents to the stranger a series of intensely interesting *tableaux vivants*. There, with ample turban and flowing beard and long robes of striped silk, stalks the stately Turk, followed by a scantily clad Fellahin. Next comes some light of the Harem, some Fatima or Eminah, mounted on a carefully painted donkey led by an armed slave. On the street this fair enchantress is but a shroud-like mass of drapery, through which the curious gazer can sometimes discern the outline of a delicately oval face and the flash of a black liquid eye. Behind her, in thin clinging robes of dark but vivid blue, with graceful form and carelessly veiled melancholy face, a Niobe in bronze, glides an Abyssinian slave-girl. By her side a swarthy Bedouin sheik reins in an Arab steed, whose prancings and curvettings somewhat disturb the gravity of the tiny donkey upon which that Englishman is mounted; while over all streams the sunshine of an Egyptian noon, flooding with light the unfamiliar draperies, the strange Saracenic architecture, and the varying features and costumes of each commingling race.

While conducting the important operation of bargaining for a dahabeeyah (a Nile-boat), Miss Edwards and her party went to interview the Great Pyramid. She had fancied that the Pyramids looked small and unimpressive when she first caught a glimpse of them from the railway carriage; but once at the base of this gigantic tomb, she realised, with a sense of awe and wonder, how mighty it was. As she lingered, loath to leave the scene, the sun set in crimson glory behind the sands of the Libyan Desert, and the shadow flung by this immense mass of masonry stretched full three-quarters of a mile over the plain below. 'It was,' she says, 'with a thrill of something like awe that I remembered that this self-same shadow had gone on registering not only the height of the most stupendous guonon ever set up by human hands, but the slow passage, day by day, of more than sixty centuries of the world's history.'

Before starting up the Nile, Miss Edwards witnessed two of the characteristic sights of Cairo—a performance of howling dervishes, and the departure of a caravan of pilgrims for Mecca. She found the convent of the howling dervishes situated in a picturesque nook beyond the walls. The gateway and courtyard beyond were shaded by a great sycamore tree, through whose branches the glowing sunshine broke in vivid flecks and

bars of gold. About seventy dervishes were present; and with the aid of eight musicians, and to the chant of 'Allah! Allah!' they danced round in a circle until they had worked themselves up into a state of convulsive frenzy. Gradually their dance became a series of mad leaps, performed with incredible rapidity, their chant swelled into a hoarse scream, and at last one of the devotees fell writhing and shrieking to the ground. This ended the first performance; and the English ladies did not wait for a second.

Having made choice of a dahabeeyah yclept the *Phila*, Miss Edwards and her party started with a fair breeze for their voyage up the Nile. This once sacred historic river is, as every one knows, all in all to the Egyptian. His harvests depend upon its beneficent inundations, its waves form his highway to the sea, he eats of its fish, he drinks of its waters, and finds them still, as his ancestors found them of old, delicious as the nectar of the gods. Egypt, baked and shrivelled by the glowing sun into one immense brick, annually sinks beneath the waters of the life-giving river, and emerges from the flood, fresh, radiant, shining, like an emerald, flower-crowned like Ceres of old, and holding in her full hands an ample promise of fruit and sheaf. A Nile voyage in favourable weather is about the pleasantest of all pleasant things. The large sails of the dahabeeyah swell out to the breeze like the wide snowy wings of a sea-bird, and fleet as that bird, she cleaves her way past water-palaces and suburban gardens. The minarets and domes of Cairo are left behind; the Pyramids, towering over the groves of palm, stand clearly out against the cloudless sky; and the distant ridges of the Arabian hills glow with softened shades of tawny purple. As evening falls, every charm of the landscape is subdued into a more tender repose; the night-breeze balmy and cool sweeps up the river; darkness follows, and your boat is moored for the night at Bedreshayn.

Morning on the Nile is inexpressibly fresh and beautiful. At the first faint streak of dawn the light mist clears away, and Aurora spreads for the sun a rosy chariot of clouds, into which he steps at once, flushing the stately palm-groves, and the gleaming river, and the picturesque water-wheels, and the swarthy crew, with a flood of golden radiance. There was, however, little time for sentimental feeling, our author's whole attention being claimed by a horrible clamour which arose outside, caused by the arrival of a regiment of donkeys attended by a phalanx of men and boys.

Mounted upon eight of these asinine martyrs, Miss Edwards and her party proceeded to Sakkarah and Memphis, riding through a country which would have been monotonous but for the subtle beauty of its colouring. Tender tints of rose, and warm tones of russet gold, pale opalescent blues and grays and dusky purples, were all blended by Nature's cunning brush, shading into the nearer green of the dusky palm forests, until they formed one inimitable whole. Sakkarah is a vast necropolis, whose more distinguished tombs are pyramids. The soil around is full of fragments of broken pottery, mummy gods, bones, shreds of linen, and lumps of a strange brown substance like dried sponge. Tread lightly, O Northern stranger! around you are the mighty dead; that brown spongy mass was once warm human flesh, instinct with power and passion;

that skull perchance once held the scheming brain of a Pharaoh, who reared for himself one of these vast sepulchres, little dreaming of this all too ignoble resurrection. Of Memphis, the ancient city of the Egyptian kings, only a few mounds remain embowered in vast palm-forests, through whose fan-like foliage the brilliant sunshine falls aslant upon a muddy pool, where, face downwards, lies the far-famed Colossus of Rameses the Great, which, like Cleopatra's Needle, belongs to the British nation. This, with a few battered sphinxes, is all that is left of one of the earliest cities of the world.

On their way to Minieh, a Moslem saint of peculiar sanctity, yclept holy St Cotton, swam out to them, and having hallowed by a touch the tiller-ropes and yards of the *Phila*, dropped into the water again, and swam back to the shore. It happened to be market-day when they arrived at Minieh, and having stores to buy, they proceeded to it, and found almost everything exceedingly cheap. How it would rejoice the heart of a thrifty housewife here at home to be able to buy a hundred eggs for fourteenpence, or a couple of chickens for twopence, not to speak of fine geese at two shillings a head! Large and very good turkeys may be bought for three-and-sixpence, a lamb for seven shillings, and a sheep for sixteen shillings or a pound, fruit and vegetables being proportionably moderate.

In Egypt, little children have very hard lines of it. It makes one's heart ache to read of the disease and suffering induced by the barbarous ignorance of their parents. Miss Edwards says: 'To brush away the flies that beset the eyes of young children is impious; hence ophthalmia and various kinds of blindness. I have seen infants lying in their mother's arms with six or eight flies in each eye; I have seen the little helpless hands put down reprovingly if they approached the seat of annoyance. I have seen children of four or five years old with the surface of one or both eyes eaten away, and others with a large fleshy lump growing out where the pupil had been destroyed.'

As a consequence of this horrible cruelty three children out of every five die in Egypt; and in certain districts every twentieth person is either wholly or partially blind.

On Christmas-day Miss Edwards entertained some friends, who were in a dahabceyah behind them, to dinner. The guests consisted of a bride and bridegroom and a painter. The scene around their floating dining-room was lovely; the placid river flowed tranquilly through broad green savannahs, and breezes redolent of perfume fanned the lotus lilies beneath their prow. It required all the conventional sentiment which attaches to a blazing plum-pudding to convince them that it was really Christmas.

At Siout, the capital of Middle Egypt, they inspected the celebrated Stabl d'Antar. It is a splendid tomb temple hewn out of the rock. The roofs of its lofty chambers are painted in fresh and vivid colours, and the walls are covered with bas-reliefs and hieroglyphics.

En route to Denderah, at a part of the river where the banks were flat and bare, they saw on the western shore what seemed to be a large grizzled ape perched upon a dust-heap, and learned with intense surprise that it was Sheikh Seleem, a sort of Moslem St Simon. Stylites.

There he sat in the gathering night, as he had sat for fifty years from darkness to dawn, and from dawn to darkness, amid inconceivable filth and squalor, not even moving to feed himself. The sailors shouted to him as they passed, loudly imploring his blessing; but he made no sign of response. Motionless as a huge frog, he squatted on his dust-throne, inflated with spiritual pride or madness, or both.

About ten miles below Denderah thousands of Fellahin were at enforced work on the embankment of a new canal. These canals are the life of Egypt; by them the supply of the precious water is regulated and its outlay economised. Without canals and the ever-recurring water-wheels, the fresh green beauty of the river-plains would soon disappear, and famine, gaunt and hollow-eyed, stalk upon the scene, with disease and death in its train.

At Denderah, among other interesting remains, they found a splendid temple in an almost perfect condition, with a finely executed bas-relief of Cleopatra. This queen of beauty, whose slaves were the masters of the world, is fair enough in this mask of stone to recall to Miss Edwards something of that loveliness which conquered Caesar. 'Mannerism apart,' she says, 'the face wants for neither individuality nor beauty. Cover the mouth, and you have an almost faultless profile. The chin and throat are also quite lovely; while the whole face, suggestive of cruelty, subtlety, and voluptuousness, carries with it an indefinable expression, not only of portraiture but of likeness.'

On the third day after leaving Denderah, they saw in the faint light of the early morning the gigantic propylons of Karnak towering vast and gray against the horizon. The warm flush of the dawn bathed with rosy light the range of precipitous hills, which are honeycombed with the tombs of the kings, and kissed into tender beauty the time-worn columns of Luxor, the ancient Woolwich of the Pharaohs. At Karnak, the ruins are stupendous; the eye loses itself in a waste of giant propylons, columns towering to the clouds, colossal figures in black granite, partially buried in the sand; and a little apart, in solitary grandeur, an immense obelisk, seventy-five feet high, covered with hieroglyphics and bas-reliefs, depicting scenes in the life of Rameses the Great. In the temple at Karnak, the great hall of pillars, roofless and vast, presents to the eye of the curious gazer forests of colonnades, aisles of pillars, huge pylons, towering like giants to the sky, half-hiding, half-revealing weird fantastic bas-reliefs of the gods, who glare, superb in ruin, over their desolated shrines. The sunlight streaming through the open portal shines on avenues of sphinxes, battered colossi, vast lengths of splendid bas-reliefs, glowing with a depth and freshness of colour which Time has had no power to fade; labyrinth of headless statues, prostrate obelisks, shattered images, all in such numbers that they produce a bewildering effect upon the mind.

At Esneh, their next halting-place, there was also a very beautiful temple, dedicated to Kneph. Assouan and Elephantiné (the Isle of Flowers) came next. At Assouan, Egypt proper ceases, and Nubia begins. Here the traveller enters upon the region of the Cataracts, a succession of rapids extending almost all the way to Philæ. The Nile at this point is singularly picturesque. First narrowed between

banks of dark red cliffs, it suddenly expands almost to the breadth of a lake, and presents a broad expanse bristling with rocks and covered with innumerable islets, round which the water rushes in swirling eddies of foam. The navigation among these islets is difficult and dangerous; the boat half buried in spray, struggles gallantly forward, making a succession of rapid rushes, as if she were about to dive headlong over the fall; but it is too much for her; she recoils, quivers, turns round, and seems to be driving right upon a huge mass of black granite, when the Sheik of the Cataracts comes to her aid. This tutelary genius of the Nile dahabeeyahs has few of the external attributes of a hero. He is a little fat ugly man; but what of that? he knows his work, and can do it. A moment more, and the dahabeeyah and its inmates will be engulfed in the foaming abyss; but before that moment comes, he springs up, plunges into the torrent, pushes off the boat by sheer force of muscle; and then he and his tawny assistants drag her up the rapid.

It is a lengthy operation; and while it was in progress, Miss Edwards and her party made a pilgrimage to Philæ. Beautiful Philæ, the fabled tomb of Osiris, the Holy Island whose very soil was sacred, still preserves almost uninjured the beautiful temples and gorgeous tomb-palaces which were the master-pieces of the later style of Egyptian art. The vastness, the gigantic proportions of Thebes and Karnak, are not aimed at here; on the contrary, there is an inimitable grace, an airy lightness about cloister and colonnade, which are half Greek. And what Art has so nobly accomplished, Nature has not been slow to assist. The cloudless sky, the graceful palms, the majestic carob trees, enwrap with greenness and beauty all the wealth of colouring, of sculpture, and of architecture which the past has bequeathed to this spot, once so hallowed, now so lonely. Lingeringly tenderly reminiscent on the pearly strand of this voluptuous Egyptian Iona, one half expects to see the white-robed priests of Isis wind again in long procession out of the shadow into the sunshine, solemn and stern, vainly questioning of the forgotten ages—What meaneth this?

Leaving Philæ, ever lessening in the distance, the travellers glide away into Nubia, and are quickly conscious of a perceptible change, first in the river scenery, which becomes wilder and more grand, and then in the character of the inhabitants, who become more savage, and at the same time more truthful and honest. The climate becomes warmer, and with the accession of heat, turbans disappear, and the only headgear is that furnished by Nature, consisting of profuse thickly matted hair, plentifully anointed with castor-oil, a species of pomade which frizzling in a tropical sun makes a Nubian beau or belle an exceedingly savoury individual. Very little clothing is worn; the young of both sexes are content with a slight covering round the waist, and the matrons with a single long loose garment of blue. The Nubian women are often beautiful, with lustrous gentle eyes, and grand majestic figures like Junos in bronze. If their wardrobes are slender, their jewel caskets seem well supplied, for they almost invariably wear a profusion of gold and silver ornaments.

Nubia, like Egypt, abounds in temples. At Aboo-Simbel there are two excavated out of the

sandstone rock. On the façade of the great temple there is a wonderful row of colossal figures, portraits of Rameses the Great and some of his more immediate successors. This Rameses is believed with good reason to have been the Pharaoh who oppressed the Israelites. Many hieroglyphic records of his reign have been discovered, some of which when deciphered run thus: 'I, the scribe, have obeyed the orders of my master, and served out rations to the Hebrews, who quarry stone for the palaces of King Rameses, Mer Ammon.' This monarch, whose passion it was to build, has left a more ineradicable impress of his personality upon the scenes of his former glory, than any of his predecessors or successors have done. His face, preserved for us by an Aboo-Simbel Michael Angelo, still frowns in lonely majesty across the desert sands, handsome, placid, sternly implacable, precisely the man who would account the tears and anguish of helpless thousands as less than nothing when weighed against a pet project.

Shortly after leaving Aboo-Simbel, Miss Edwards had a pleasure which she had almost despaired of—she saw a crocodile. The creature was asleep upon a sandbank, and was to all appearance so exactly like a log of drift-wood, that our author refused to believe it was a veritable crocodile until, aroused by the approach of the dahabeeyah, it cocked up its tail, wriggled off the bank, and splashed into the water with amazing rapidity.

They were now on their return journey, and the wind was against them, necessitating frequent and vexatious delays.

At a place called Ayserat they paid a visit to a native gentleman, Ratab Agha, and before leaving were conducted to his harem. He had two wives: the principal wife was very beautiful, with auburn hair, soft brown eyes, and lovely complexion; her rival was plain; and both were magnificently dressed in black robes embroidered with silver, full pink Turkish trousers, and silver bracelets and anklets. They wore their hair cut straight across the brow and plaited behind into an infinitude of small tails studded with coins.

A parting visit to the Pyramids followed; and with an inspection of these colossal monuments, which remain an imperishable testimony to the vigour of the world's dawn, they bade adieu to what was once the mighty temple-crowned empire of Rameses the Great.

A QUEER CLUE.

IN TWO CHAPTERS.—CHAPTER I.

As an ex-detective, I am often asked to relate my adventures, and at one time I was ready enough to do so; but I soon found that my tales were looked upon as dull prosy things, and not at all like what detectives ought to have to say for themselves. Everybody seemed to think that detectives ought to find things out by a sort of magical divination; but I was reckoned a pretty good one, and I have known some of our greatest celebrities; and the only way any of us ever found anything out was by inquiring of everybody who was likely to know a little, keeping our eyes on any probable party, holding our tongues, and putting all the scraps together. Now and then we are befriended by a lucky chance; and when this happens, we get a

hundred times more praise than when we puzzle out the darkest and toughest case. The last affair I was ever engaged in was of this kind. I was first concerned in it two years before I left the police, after, by-the-bye, I had quite given up the detective branch; and I resumed it three years afterwards, that is three years after I had left the police; and this is how it occurred. I must first say, however, that I don't at all regard this as one of the dull prosy cases I referred to; in fact, it was the most exciting business I was ever engaged in.

I had left the detective work, as I said, and indeed had left London, for when I grew a little tired of the business, I was recommended to the authorities at Combestead, a thriving market-town in one of the home counties; and I had a very comfortable situation there, having little to do, very good pay, and being head of the borough police. Of course there is a great deal of difference between life in the country and life in town, and from a policeman's view it perhaps appears greater than it does to anybody else; and whereas I had often wondered how anybody could be detected in London, I was equally surprised to think how anybody could hope to escape in the country; for, excepting when strangers came down on some carefully planned burglary, we could nearly always tell where to look for our men if anything went wrong; in short, I knew everybody. As a matter of course, everybody knew me.

There was a middle-aged party lived in a quiet row of houses in Orchard Street—which ran parallel with our High Street—a Miss Parkway, who was reputed to be pretty well off, although not extremely rich, and reputed also to be rather eccentric. She lived by herself, in the sense of having none of her relatives with her; but there were other persons, although not many, in the large house where she lodged. I had my attention drawn to her by seeing her walking repeatedly in company with a young man of no very good character, who was fully twenty years her junior; and at last I heard she was going to be married to him. All the town professed to be surprised and shocked at this, but I wasn't. Whether detectives get hard of heart in such things or not, I can't say, but nothing in the way of a woman of five-and-forty marrying a man of five-and-twenty would ever surprise me; nor should I be surprised at the man marrying the woman if she had money, as in this case. After all, although I have said John Lytherly—that was his name—was of no very good character, yet there was nothing serious against him. He was a good-tempered, good-looking, easy sort of fellow, with a lot of cleverness about him too, that always shewed itself when it wasn't wanted; and never shewed itself when it might be of service. He now called himself a photographer; but had been a solicitor's clerk, an actor, a traveller for a wine-merchant, a barman, and had once, before his mother died, been bought out of the Lancashire. However, it was now pretty well known that John was going to marry Miss Parkway, and half the young chaps in Combestead ridiculed and envied him by turns.

Matters progressed so far that it was known the lady had given orders to Bunnyman and Company, our chief bankers, to call in a thousand pounds of her money which was out on mortgage; and it was said she intended to buy one of the houses in the High Street and fit it up as a photographer's. It

was also reported that old Mr Bunnyman said: 'I hope, Miss Parkway, that whatever you do with your money, you will do nothing that you have not well considered.' And it was also said that Miss Parkway replied: 'If I wanted to be preached to, Mr Bunnyman, I should go to your brother the Ranter;'—perhaps because Mr Bunnyman had a brother who preached, though he wasn't a Ranter at all. However, as these two were by themselves, I don't see how any one could have known what passed; and these confidential conversations in books and histories are certainly things I don't believe in.

It was known for certain, however, that she had not only given notice, but had actually withdrawn the money; and among other things it was said that she had admitted to her landlady Mrs Ambliss, that the match with Lytherly would break off all intimacy with her friends. She only had one relative who came to see her, and that was a gentleman living some forty miles away, but he had not been to Combestead lately. Whether he was offended or not, neither the landlady nor lodger could say; but the latter feared he was, as she had written and told him exactly how affairs stood and what steps she had taken, but had received no reply to her letter. Lytherly seemed, very naturally, to be brightening up, and took our jocular congratulations—for I had my say as well as the others—in a good-tempered although rather a conceited style. One annoyance he felt, which was, that everybody to whom he owed money—which was every one who would trust him—was anxious to be the first paid; and thinking that a little gentle pressure might help them, two or three of the tradesmen took out county court summonses against him; and this, as he said, was very hard on him and very selfish. However, there seemed a little chance that they would defeat themselves, for, harassed and worried by these doings, he was forced to ask Miss Parkway for an advance of money, being the first time he had ever done so. He had received money from her; but she had always offered it, and pressed it upon him when he made a show, if he was not actually in earnest, of wishing to refuse it. Whether she was in a bad temper at the time, or whether she was hurt at his making such a request, Lytherly could not say, but she refused to make the advance, and they parted worse friends than they had been for some time.

All this the young fellow let out at the *Bell* on the Saturday, as the refusal happened on the Friday. A great part of it in my hearing, for I generally took my pipe and glass at the *Bell*, and I saw that he was well on for tipsy. He had indeed been drinking there some hours, and would perhaps have stopped longer, but that the landlord persuaded him to go home. He was hardly able to walk, and as I did not wish him to get into any trouble, which might mean also trouble to me, I followed him to the door, determined I would see him to his lodgings if necessary; but just then his landlady's son happened to come by. The poor chap, as I well remember, had been to the dentist's to have a tooth drawn; but his face was so swollen that Mr Clawes would not attempt to draw it till daylight, and the poor fellow was half distracted with pain. He offered to see Lytherly home; and as he lived in the same house and slept in the same room, of course he was the fittest party

to do so; and so off they went together, and in due course of time I went home too.

Next day was Sunday, and a quiet day enough it always was in Combestead. Younger men might have thought it dull, but it suited me. I had lived fifty years in London, and did not object to the steady-going ways of the little town; in fact I took to going to church, and all sorts of things. Well, the day passed by without anything particular; and I was really thinking of going to bed, although it was only half-past nine, for I felt sleepy and tired, when I heard somebody run hurriedly up our front garden, and then followed a very loud double-knock at the door. I lived, I should mention, at a nice house in Church Street, which was a turning that led from the High Street into Orchard Street, where, as I have said, Miss Parkway lived. I was just about to drink a glass of eggshot, which is a thing I am very partial to when I have a cold, and this was winter-time; but I put the tumbler down to listen, for when such a hurried step and knock came, it was nearly always for me; and sure enough, in another half-minute the door was opened, and I heard a voice ask if the superintendent was in; then without any tapping or waiting, my door was thrown open, and I saw a young woman, whom I knew as servant to Mrs Ambliss. The moment I saw her, I knew something serious was the matter; long experience enabled me to decide when anything really serious was coming.

'Now, Jane,' I said, 'what is it?'

'Oh, Mr Robinson!' she exclaimed (I forget whether I have mentioned before that my name is Robinson, but such is the fact), 'come round at once to missus's, for we have found poor Miss Parkway stone-dead and murdered in her room.'

And with that, as is a matter of course with such people, off she went into strong hysterics. I couldn't stop with her; so I opened my door, and equally, as a matter of course, there I found the landlady and her servant listening. 'Go in and take care of that girl,' I said; 'and one of you bring her round to Orchard Street as soon as she can walk.' I didn't stop to blow them up, and they were too glad to escape, to say a word; so off I went, and found a little cluster of people already gathered round the gate of the house I wanted. 'Here is the superintendent!' I heard them say as they made way for me. I hurried through, but had no occasion to knock at the door, for they were on the watch for me. Mr and Mrs Ambliss were in the passage, and a neighbour from next door; all looked as pale and flurried as people do under the circumstances.

'This is a most terrible affair, sir,' says poor old Ambliss, who was a feeble superannuated bank clerk. 'We have sent for you, sir, and the doctor, as being the best we could do. But perhaps you would like to go into her room at once!'

I said I should, as a matter of course; and they led me to her room. There was a light there, and they brought more up, so that everything was plainly visible. The people had not liked, or had been afraid to disturb anything, so the room was in the same state as when they had entered it. It appeared they had not been surprised at Miss Parkway not coming down in the morning, for this was not uncommon with her; but when the afternoon and evening passed away and she did not appear, and no answer was returned to their

rapping at her door, they grew alarmed, and at last forced an entrance, when they found the furniture in confusion, as though a struggle had taken place, and poor Miss Parkway in her night-dress lying on her face quite dead. They had lifted her on to the bed, and from the marks on her throat had judged she died by strangulation. As I could do no good to her, I noticed as closely as I was able the appearance of the room, and especially looked for any fragments of cloth torn from an assailant's clothes, which often remain after a struggle; or a dropped weapon, or any unusual marks. But I could see nothing. There was no difficulty in deciding how the assassin had entered the apartment, and how he had left it, for the room was on the ground-floor, and the lower sash of one of the windows was thrown up, although the blind was drawn fully down. The furniture was knocked over and upset; the washstand, which was a large and somewhat peculiar one, of a clumsy and old-fashioned description, had been overthrown, and had fallen into the fireplace, where it lay resting on the bars in a very curious manner; while the jug had fallen into the grate, deluging the fireplace with water, but, extraordinary to relate, without being broken; not broken to pieces at anyrate, although badly cracked. A great deal of noise had probably been made, and cries for help probably uttered; but Ambliss and his wife were both deaf, and they and the servant all slept at the top of the big house in the front; while poor Miss Parkway slept at the bottom at the back, and in a room which was built out from the house itself.

I had time to hear and notice all this before the doctor came; and his attendance was of course a mere matter of form. No one could help or harm the poor woman now; so, with the information I had gained, I went to the house of the nearest magistrate, a very active gentleman and a solicitor. I ought to have mentioned that the drawers in which Miss Parkway kept her money and jewellery were forced open and every valuable abstracted; the only trace of them being a few links of a slight chain of a very unusual pattern, which, with a curious stone, the lady generally wore round her neck. This chain had evidently been broken by the violence used, and parts of it scattered about; the stone was gone.

Information was of course sent to Miss Parkway's relative who came sometimes to visit her. And the result of all the inquiries made was to make things look so very suspicious against young Lytherly, and so much stress was laid upon his quarrel with Miss Parkway on her refusal to lend him money—which seemed known to everybody—that I was obliged to apprehend him. I didn't want to hurt his feelings; so I went myself with a fly, although his lodgings were not half a mile from the town-hall, so as to spare him from walking in custody through the streets. I found him at home, looking very miserable, and when he saw me he said: 'I have been expecting you all the morning, Mr Robinson; I am very glad you have come.'

'Well, I'm sorry,' I answered. 'But you may as well remember that the least said is soonest mended, Mr Lytherly.'

'Thanks for your caution, old friend,' he says with a very sickly smile; 'but I shan't hurt myself, and I feel sure no one else can do so. Why

I said I was glad you had come, was because from Sunday night, when the murder was found out, until now, middle day on Tuesday, everybody has shunned me and avoided me as if I had the plague. I know why, and now it will be over.'

I didn't put handcuffs on him or anything of that; and when we got into the street he saw the fly, round which there had already gathered at least a score of boys and girls, who had, I suppose, seen me go in. He looked round, and said: 'This was very thoughtful of you, Mr Robinson; I shall not forget it.' We drove off, and spoke no more until we arrived at the town-hall. Here the magistrates were sitting; and here I found a tall, dark, grave-looking gentleman talking very earnestly to Mr Wingrave, our chief solicitor. I soon found this was Mr Parkway, the cousin of the murdered lady. He was giving instructions to the lawyer to spare no expense; to offer a reward if he thought it necessary; to have detectives down from London, and goodness knows what. Mr Wingrave introduced me, and was kind enough to say that there was no necessity for detectives to be brought, as they had so eminent a functionary as myself in the town.

It was supposed that this would be merely a preliminary examination, but it turned out differently. A few of Lytherly's companions—although, as it transpired afterwards, they fully believed him guilty—were yet determined he should have a chance, and so subscribed a guinea for old Jemmy Crotton, the most disreputable old fellow in the town, but a very clever lawyer for all that; and Jemmy soon came bustling in. He had a few minutes' conversation with Lytherly, and then asked that the hearing might be put off for an hour. This was of course granted; and by the end of that time he had overwhelming evidence to prove an alibi; for the landlady's son hadn't slept a wink for his toothache, and he was with Lytherly until dinner-time on Sunday; and then the accused went for a walk with a couple of friends, and did not return until after dark, having spent two or three hours at a public-house some miles off, as the landlord, who happened to be in the town, it being market-day, helped to prove; the rest of the time he was in the *Bell*, as was usual, poor fellow.

There was no getting over this. There was not a shadow of pretence for remanding him, and so—much to Mr Parkway's evident annoyance—Lytherly was discharged. He became more popular than ever among his associates—although the respectable people of the town looked down upon him—and they had a supper in his honour that night, at which old Jemmy Crotton presided. In default of Lytherly, no clue could be found. Not a shilling of Miss Parkway's money was ever discovered in her apartments; so her murderer had got clear away with his booty. Many wisacres said we should hear of Lytherly quietly disappearing after things had settled down.

Some little excitement was created by Lytherly attempting to get into the sole funeral carriage that attended the hearse; but Mr Parkway would not permit such a thing, and was himself the only follower. It was very clear that the stranger, in common with many others, was not half satisfied with the explanation which had secured Lytherly's escape; and as I was on the ground at the funeral, I saw, as did everybody else who was there, the

frown he turned on the young man, who, in spite of his rebuff, had gone on foot to the churchyard.

Mr Parkway left that evening, having placed his business in the hands of Mr Wingrave; for as there was no will, he was the heir-at-law. Now this was a very curious affair about the will, because Miss Parkway had told her landlady not many days before, that she *had* made her will, and in fact had shewn her the document as it lay, neatly tied up, in her desk. However, it was gone now; and she had either destroyed it, or the person who had killed her had taken that as well as the money; and even if the latter was the case, it was hardly likely to turn up again. So, as I have said, Mr Parkway went home. The solicitor realised the poor lady's property; and all our efforts were in vain to discover the slightest clue to the guilty party. As for Lytherly, he soon found it was of no use to think of remaining in Combestead, for guilty or not, no one of any respectability cared to associate with him; and, as he owed to me, the worst part of it all was that old Crotton the lawyer, whenever they met at any tavern, would laugh and wink and clap him on the shoulder, and call upon every one present to remember how poor old Jemmy Crotton got his young friend off so cleverly, how they 'flummoxed' the magistrates and jockeyed the peelers, when it was any odds against his young friend.

So he went; and a good many declared he had gone off to enjoy his ill-gotten gains; but I never thought so; and one of our men going to Chatham to identify a prisoner, saw Lytherly in the uniform of the Royal Engineers, and in fact had a glass of ale with him. The young fellow said it was his only resource; dig he could not, and to beg where he was known would be in vain. He sent his respects to me; and that was the last we heard for a long time of the Combestead murder.

A CURIOUS PICTURE-BOOK.

WE have before us one of the most singular picture-books that can well be imagined; singular because unexpected in its character. It is a book containing the trade-marks of several thousand merchants, manufacturers, and shopkeepers; each device printed, in the proper size, from a block or cast of the original; and the whole collection likely to be very formidable in dimensions by-and-by. The system has sprung out of the passing of a particular Act of Parliament two years ago; and we shall best facilitate a comprehension of its nature and purport by glancing at that which preceded it.

A trade-mark and an armorial bearing have much the same meaning, however different in splendour and dignity. Each is a token to distinguish certain persons from others. In the middle ages distinguished families and famous old commercial companies had their marks; so had monasteries, abbeys, and convents; so had municipal towns and chartered guilds; so had merchants and shipowners. By degrees the mark became embodied as a trade-mark in some instances, as an heraldic shield or crest or coat-armour in others. Some noble families at the present day can shew coats of arms including (in the device) trade-marks once belonging to the founder of the family when a trader.

As a feature in legitimate commerce, it is fair

and right for a man to affix to his wares some mark or symbol to distinguish them from the wares of other traders. The mark may have a significant or symbolical meaning, or it may be wholly fanciful; no matter which, provided it be his and his only. The range to choose from is so wide as to be practically limitless; for the mark may be a name, initial, signature, word, letter, device, emblem, figure, sign, seal, stamp, or diagram; and it may be impressed upon or otherwise attached to a cask, bottle, vessel, canister, case, cover, envelope, wrapper, bar, plate, ingot, sheet, bale, packet, band, reel, cork, stopper, label, or ticket. He must indeed be a difficult man to please who cannot select out of all these. A quadruped, bird, or fish; a sun, moon, star, or comet; a triangle, diamond, square, oval, or hexagon; a crescent, a castle, a ship; a portrait, medallion, or profile; a view of a warehouse or of a plantation—anything will do, if it suffices to imply 'This is mine: you must not imitate or forge it.'

No one can glance through the daily papers, in the columns relating to actions at law, without seeing evidence how jealously the privileges of trade-marks are watched by the owners; nor is it difficult to see why this jealousy is exhibited. If A possess something which has a money-value to him, B would like to possess it also if honestly obtainable, or something sufficiently like it to be equally advantageous. Unfortunately men do not always wait to consider how far honesty should actuate them. There is a vast amount of shabby speculation on the part of men who avail themselves, directly or indirectly, of other men's trade-marks, in order to obtain a share of custom which does not fairly belong to them. A belief or hope is entertained that if the public do not know exactly which is the real Simon Pure, a sham Simon may perchance come in for some of the pickings.

Suppose, for instance, there is a Macassar oil which has brought a fortune to a particular firm; another concocter of toilet 'requisites' may be tempted to adopt the same title, in the hope that the originator may fail to shew that the Straits of Macassar have really anything to do with the matter. If a compounder of pills and ointments (say Mr Jones) is driving a flourishing trade at a particular shop, and if another person (also named Jones) opens a shop close by, and sells similarly curative pills and ointments, he may hope to trade partly on the good-luck of the other, and may defy any one to prove that the surname has been falsely assumed. If a trader be making a good thing out of baking powder, and another man wraps up another (perhaps an inferior) kind of baking powder in packets printed almost exactly in the same style and wording, he trusts to an unwary public being deceived in the matter. No small difficulty has been felt at times, by judges and jurors, in determining whether a particular designation or inscription really deserves the rank of a trade-mark, and ought to be protected as such. If a man's name be combined with the name of the article sold, this would in most cases be a good trade-mark: such as Day and Martin's blacking, Delarue's playing-cards, Elkington's electro-plate, Rimpel's perfumed valentines, Reid's stout, Beaufoy's vinegar, Fortnum and Mason's hampers, Crosse and Blackwell's pickles, and the like. But if there happen to be two men of the same

name in the same trade, then there may possibly be materials for wrangling, should the men be disposed to wrangle. It is for this reason that Dent's watches, Mappin's cutlery, Clarke's coals, Smith's gin, &c. would not be alone sufficient as trade-mark designations; because there are two persons or two firms entitled to use it, something additional would be needed.

The imitation of a label is one of the most prevalent modes of displaying the shabby dishonesty of those who disregard the rights conferred by a trade-mark; but brands and painted marks are imitated with equal boldness, if not so frequently. Soda-water bottles which have in the making been stamped with the name of a particular firm have, in like manner, got into the hands of persons who fill them with soda-water of an obscure and unrenowned quality. Wine-casks and cigar-boxes, branded with well-known names, have similarly been utilised by the sellers of inferior commodities. As to two Howqua's mixtures, it was shewn that there was no such person as Howqua concerned in the matter. Is it true that Birmingham manufacturers often receive orders from merchants to make certain goods, and to stamp on them certain trade-marks belonging to third parties; and that the manufacturers do this as a matter of course, 'all in the way of business?' Is it true that, in obedience to orders from wholesale houses in the Manchester goods-trade, manufacturers will sometimes put two hundred yards of sewing-thread on a reel, and paste on it a label denoting three hundred yards? If so, 'pity 'tis 'tis true.' The latter of these two ifs does not relate to a trade-mark piracy, but it is equally indicative of a shameful disregard of the principles of *meum and tuum*.

Foreigners have had in past years much reason to complain of English imitations of labels, inscriptions, signatures, and trade-marks. Among metal goods there was one American Company famed for the really good edge-tools manufactured by them; they were imitated at Birmingham, so far as regards a similar mark stamped on each article, or a similar label attached; of course the tools, whether good, middling, or bad, were not what they professed to be; they were worth less in the market, but were nevertheless sent forth as if made by the original Company—a bit of sharp practice very little creditable to the parties concerned.

Most amply have foreigners taken their revenge; indeed it is not improbable that they first began this game; seeing that they had more to gain from a great manufacturing nation than we had to gain from them in this way. Sheffield has been despoiled by them in a notable degree. Knives, files, fish-hooks, needles, &c. made very cheaply of inferior steel, receive in the German workshops (more perhaps than in those of France or Belgium) brands, marks, wrappers, and labels so closely resembling those of eminent Sheffield firms, as to deceive all but the most wary. In some instances, the foreigners have given the go-by to us with an almost superb audacity: imitating the very notification on English wrappers that to imitate that particular trade-mark is felony! Print what they may, stamp what they may, English manufacturers of high-class goods find that they cannot ward off this kind of cheater—cheater, not of money direct, but of the good reputation which possesses

money's worth. However, international trade-mark laws are doing something to lessen this unfairness—of English towards foreigners as well as of foreigners towards English. Some further illustrations of these matters will be found in the volume of this *Journal* for 1859.

Now for our picture-book.

An Act of Parliament passed two years ago ordained that from and after a specified date all new trade-marks must consist of the printed or impressed or woven name of a particular firm or individual; or a copy of the written signature of the party concerned; or distinctive devices, designs, marks, headings, labels, or tickets. The scope is sufficiently wide to give an ample choice; but it must not extend to representations of the Queen, the royal family, or foreign sovereigns; nor to royal or national arms, crests, or mottoes; nor to the arms of cities, boroughs, countries, or families; nor to representations of prize or exhibition medals; nor to the use of the words 'trade-mark,' 'patent,' 'warranted,' or 'guaranteed.' No such restrictions, however, are placed upon any trade-marks that were in use before the passing of the recent Act. The Lord Chancellor and the Commissioners of Patents divide between them the carrying into effect of the new statute. A new office has been established for the registry of trade-marks, with a registrar at its head. The Lord Chancellor has framed rules and regulations, with a tariff of fees approved by the Treasury. The registry, when once granted for a trade-mark, holds good for fourteen years, and is renewable for equal periods of fourteen years on the payment of additional fees. There is so much to pay on application for registry; then so much for any and every extension to other classes of goods; then so much if there be two or more marks for the same article; then so much on actual registration; then so much for every change of name or of address; and then so much for a certificate. The outlay amounts to a good many pounds altogether, but not approaching the cost of a patent. The registrar has a certain time allowed to him between the application and the registration to make the necessary scrutiny, &c. Every application for registry, accompanied by a drawing or engraving, must give an accurate description of the trade-mark, specifying any words, &c. to which the applicant attaches special value—of course within the limits permitted by the rules.

As one registration of any trade-mark is valid only for one class of goods, a careful classification becomes necessary; and this has proved to be one of the most remarkable features in the system. Some one's brains, or the brains of more than one, must have been a good deal exercised in dividing the whole range of human industry into fifty classes, and in assigning the contents of each class. For instance, the first three classes comprise chemical substances and preparations used in manufactures, agriculture, and medicine; the fourth resins, oils, and gums. Then follow three great classes to include metals, machines, and engines; four more for instruments and tools of various kinds; and two for cutlery and edge-tools. Without specifying each individually, it will suffice to say that two classes are occupied with works in the precious metals and jewellery; two with glass and china; two with building and engineering materials and appliances; two with arms, ammunition, and explosives; one for naval equipments and appli-

ances; and one for land vehicles of all kinds. The textile branches of industry make a large demand for classification, in regard to raw materials, yarns, thread, and piece-goods: three for cotton, three for flax and hemp, one for jute, three for silk, three for wool and worsted, and one for carpeting and rugs. Saddlery and harness require one class to themselves, so does made-up clothing, so do india-rubber and gutta-percha goods. Paper, printing, and bookbinding; furniture and upholstery; food and ingredients for food; fermented and distilled liquors; aerated and mineralised beverages; tobacco, snuff, and cigars; agricultural and horticultural seeds; candles, matches, lamp-fuel, and laundry substances; perfumery and toilet requisites; games and toys of all kinds—claim each its own class. Lastly comes class fifty, a refuge for the destitute, comprising everything 'miscellaneous,' everything for which room cannot well be found in any of the other classes. The registrar has sometimes a little difficulty in deciding to which class a particular trade-mark properly belongs.

As one of the consequences of the new Act of Parliament, a *Trade-mark Journal* has been established by the Commissioners; and this is our picture-book. It appears once, twice, or thrice a week, according to the requirements of the subject, and (at the time we are now writing) has reached about its seventieth number, and contains something like four thousand pictures or representations of trade-marks. To what extent the collection will increase by-and-by, no one can form even a guess. The illustrations relate to the trade-marks applied for under the new Act; and the *Journal* also gives the name and calling of each applicant, a description of the goods, and a statement of the length of time during which the mark has been used. The *Journal* thus affords all persons interested in trade-marks authoritative information as to the nature of the marks used in the respective trades. A wood-cut block or an electrotype must be forwarded to the office, representing the particular trade-mark applied for, if it is to appear in the *Journal*; and each quarto page is made up by printing from several such blocks or casts. Even if the mark consists only of names and words, still a block or plate must be sent representing it.

The Master, Warden, Searchers, and Assistants of the Cutlers' Company at Sheffield possess, in virtue of ancient charters, very special privileges, which the new registrar of trade-marks is not allowed to contravene. He works in harmony with the Company; and every trade-mark recognised by the latter may claim of right admission into the register. To facilitate the granting of trade-marks for cotton goods, an office has been established at Manchester for the exhibition of all marks, devices, headings, labels, tickets, letters, &c. used in the cotton trade, and locally designated 'cotton-marks;' and a committee of experienced Manchester men decide which among these symbols or hieroglyphics deserve to be regarded as trade-marks for registration.

Who can count the varieties of fanciful devices that make their appearance in our picture-book? Analogy between the device and the goods is sometimes attended to; but more frequently it is thrown overboard altogether. Do we require portraits of individuals, celebrated or otherwise? Here is a sarsaparilla man, here one renowned for cod-liver

oil, and anon a hero of sewing-machines; Sir Walter Raleigh is brought into requisition by a tobacco manufacturer; while a cigar-maker, taking advantage of the recent excitement connected with a famous picture, adopts a wood-cut copy of Gainsborough's 'Duchess of Devonshire.' Or are we likely to be smitten with views and landscapes? We can choose between the Egyptian pyramids lighted up with an orient sun; a view of Keswick (near which most of our black-lead for pencils is obtained); a view of a paper manufactory. In some sense apposite are a baby in a cradle, for needle-making; a broken willow-pattern plate, for a newly warranted cement; the Colossus of Rhodes [roads], for railway signals; Cupid sharpening his arrows, for emery-grinding wheels; a smart man measuring round a smart forehead, for hat-making; the sun eclipsing nearly everything, for the eclipse sauce; a dog's head, for fibrine dog-cake; four nigger plantation minstrels, for cigars; and 'No place like home' as a trade-mark motto for fenders and fire-irons.

To account for others, the fancy must make wide excursions indeed. A maker of edge-tools adopts stars and crowns, a monkey eating an apple, an elephant's head, oxen and lions with initials on their flanks, a negro's head, a cassowary, a boot, a sledge; and the head of an Aztec accompanied by the inscription: 'Look for this stamp on each tool, if you want a genuine article made from electro-boragic cast-steel.' A locomotive does not seem specially suitable as a trade-mark for silk goods; nor a rearing and roaring white lion for Portland cement; nor a feudal castle for good hosiery; nor a crowing cock for artificial manure; nor a helmsman at the wheel for aerated waters; nor a tearing ranting buffalo for floor-cloth.

POPPET'S PRANKS.

POPPET, the subject of the following sketch, was a little brown monkey, who was for several years a member of our family. She had no hair on her face or the palms of her hands—I say *hands*, as they were beautifully formed, with long filbert nails, very pretty although black, except the thumb, which certainly was not aristocratic, being as broad as long. Her feet were like her hands, but longer, and she could use them with equal facility. Her eyes were really beautiful, of a clear golden brown; the nose certainly rather flattened; and the mouth large, but displaying a set of beautiful little pearly teeth that many a belle might have envied. Altogether Poppet was a very pretty little thing; and when arrayed in a little tartan dress with white tucker, her hair brushed neatly, and an amiable expression on her face, looked very winsome and coaxing; but that expression could vanish with the swiftness of lightning, and one the reverse of prepossessing take its place.

How we lived for the first three months after her arrival, when she roamed the house at her own sweet will, has been a source of wonder ever since; certainly it was in much discomfort; when working; sitting with our scissors and thread in our pockets, for if they were placed on the table, in an instant they were carried to the top of the window

cornice, Poppet's favourite retreat. Sometimes, if coaxed by an apple, she would drop them; at other times no blandishments would prevail, and she would sit drawing her sharp little teeth over the thread, cutting through every row. If she captured a paper of pins or needles, she delighted to climb to the top of a tall plum-tree, where, free from molestation and deaf to entreaties, she amused herself by dropping them one by one. One day my mother entered the bath-room just in time to see Poppet dart out of the window to a large tree, which unfortunately grew close by, with a quart bottle of magnesia in her hand, which she proceeded to shower down, much amused at the miniature snow-storm, and not leaving a grain in the bottle. The meals at that time were most uncomfortable. When there were eggs for breakfast, we had to pocket or hide those not in immediate use, or Poppet would snatch them up and be out of reach in a moment. As a general rule, when food is fairly in the mouth, it may be considered safe; but I have often seen Poppet perch on some one's shoulder, open the mouth by a sudden jerk of one hand on the nose, and another on the chin; then the little brown hand would dive in, and the contents be transferred to her pouches; all being done with such extreme rapidity that strangers used to think it little short of magic.

It was always a terrible business to get Poppet to bed, having to coax her down by placing an apple or piece of cake on the table, and then try to seize her when she approached the decoy; but her movements were so rapid that this had often to be repeated several times. At last patience failed, and it was resolved she should be put to bed at six o'clock, when she had her last meal, being quite sure of her then, as she always had a 'goodie,' which she was allowed to take herself from a bottle of mixed fruit-drops, kept for her especial delectation. Poppet evidently regarded the production of this bottle as the event of the day, but never learnt by experience that the bottle neck was too narrow to draw back her hand when quite full, and that it could only be done if one or two goodies were seized. Each night she would sit with her little brown face puckered up into an expression of intense anxiety as she clutched as large a handful as possible. After trying ineffectually, she would draw out two with a sudden dash, and endeavour to get her hand in again before the stopper was put on; and her movements were so quick that she often succeeded!

Everything she stole was transferred to her pouches. Anything soft, as mashed potato or rice pudding, she would eagerly cram there, until her cheeks were quite distended, when she had a most comical appearance, her face being far broader than long. When anything small was lost, the first places examined were Poppet's pouches. I remember once when she had been found in my father's dressing-room, they contained a most wonderful collection, consisting of two pair of gold studs, half-a-dozen buttons, a clock-hand much twisted, several large needles and pins, a piece of toffy, and a small piece of carrot. Verily, as we used to think, those same pouches must have been lined with leather. Poppet had a great objection to a cuckoo clock we had, and her first performance was to open the little door at the side, thrust in her arm, drag out

the poor cuckoo and bite off its head; and it was a frequent exploit (having broken the glass by dragging the clock several times off the mantelpiece on to the floor) to twist up the hands like cork-screws, giving the poor clock the most demented expression. Of course it didn't go well. Who could expect it, after such repeated shocks to its constitution!

Poppet's bedroom was in a little cupboard under a washstand; the hot-water pipe passed through it and made a kind of curve. On this a cushion was placed; and her ladyship being clothed in a garment soft and warm, was popped in, shut up with extreme rapidity, and came out in the morning, as nurse used to say, 'as warm as a little toast.' When we first got her, everybody said we should not keep her over the first winter; but we took such good care of her that she lived over several winters. Some of the family, I may observe, did secretly wish she were, not so tenacious of life, or the winters more severe. Words would fail to mention the mischief she wrought; the vases and crockery she smashed; the treasured articles (still retaining marks of her teeth) she spoiled during her life of three years with us. She seemed to have the power of elongating her limbs or throwing out an extra one in the most mysterious way. If, for instance, you left her chained to the fender and returned in about a minute, you were certain to find Poppet playing with something from the far end of the room.

She was so immensely strong she frequently dragged a heavy iron fender across the room and into the passage; and so cunning, that no knot, however complicated, could hold her long. Those cunning little fingers could have unravelled the Gordian knot itself. If she found she was watched, she dropped her hands so as to cover what she was doing, and assumed a vacant expression. She, however, never could repress a scream of triumph as she broke loose. Then she would dash round, knocking over vases and inkpots, and tipping over glasses generally full of something that would stain; doing as much mischief in five minutes as the most terrible child could in a day. Then ensued a chase, greatly enjoyed on one side, though not on the other; Poppet springing from picture to picture, making the cords creak with the sudden jerk, her chain rapping on the glass of bookcases and mirrors as she flew along their tops; at last taking refuge on the cornice, leaving every one panting and exhausted from the chase and fright. She was a great source of terror to nervous visitors, nor was this always unfounded, as on one occasion, when a lady was leaving the house congratulating herself that the visit was safely over, Poppet suddenly made her appearance, and nearly dragged the bonnet from her head. Another time, when my mother entered the drawing-room she found a friend lifting the cloth, and looking under the table. She explained her peculiar action by saying she was afraid that dreadful monkey might be there. I once had a friend Miss G., staying at the house who took a great dislike to Poppet, and was always making disparaging remarks anent her little ladyship. She was always very quick in perceiving who liked her and who didn't; so this disapproval she returned with interest. She would creep along the floor dragging the fender until she could get hold of Miss G.'s foot, when she would scold at her in the angriest manner, her eyes glowing with

indignation; and when loose, try to get at her with great fierceness.

On one occasion Poppet chased Miss G. up-stairs into her room, and then perched herself on a large wardrobe close to the door, evidently waiting for her to come out. Hearing my screams of laughter—for Poppet's anger and the lady's fright were most comical—she opened the door an inch or two and was beginning: 'Has that little wretch gone? I wonder you can keep such an abominable little brute in'—when she caught sight of Poppet's wicked grinning little face, just going to launch herself at the open door, which was closed with a hasty slam; nor would she venture out until after repeated assurances that Poppet was safe in her cage, for we had at last really been obliged to get her one, and a very strong one too. When she was first put into it every bar was shaken with all her force; and not until by frequent trials did she become convinced that they were beyond her strength.

One of my sisters constituted herself Poppet's dressmaker. She wore brown holland dresses, bound with scarlet in summer, and plaid or dark-warm cloth in winter. One day, however, Maggie's enthusiasm always to have Poppet well dressed received a sudden check. She had just completed a new tartan, when turning away for a moment, she perceived a strong smell of burning; and found Poppet had ungratefully consigned the pretty new dress to the flames. Another time, when we were removing to a different part of the country, Poppet was so upset by the noise and confusion, that in sheer wantonness she laid a pair of boots in the blazing grate; fortunately they were rescued before they were much injured.

We shall never forget the consternation that prevailed when the well-known cry, 'Poppet's loose!' echoed through the house. Every one flew to their bedroom to close the window, as, the house being covered with ivy and surrounded by trees, the monkey could make exit by any that happened to be open.

Frequently she did mischievous things in the most ingenious way. One day, finding a hair frissette on the stairs, my mother took it to her room; her sudden entrance startled Poppet, who bolted out of the window into a cherry-tree, knocking over and breaking a large mirror, also leaving three bottles that were on the mantelpiece pouring their several contents of oil, glycerine, and Eau de Cologne on to the carpet. Although Poppet screamed loudly when angry or excited, she bore pain wonderfully, and never cried out. Once when she was being chased for stealing some cough-drops, one of her fingers was put out of joint in the scrimmage. I rolled her up in a shawl and took her to the doctor. He must have put her to considerable pain in putting it in; but except by frowning very ominously, the creature made no sign. As soon, however, as I got outside the door, she turned round and nearly made her teeth meet in my thumb, evidently thinking, 'There! That's to pay you out for the pain you have made me suffer.' And once when, with her on my knee, I was using a pair of very sharp scissors, she inserted her finger between the blades, which nearly divided it; however, she never cried out, but actually bit at the wound till it bled terribly. She once startled us by making her appearance in the drawing-room with face, hands, and feet dyed a brilliant purple. We found she had upset a bottle of violet ink in

one of the bedrooms, and had then paddled about on the white quilt and toilet-cover. The ink being 'permanent,' caused the occupant of that room to regard the little brown offender with righteous indignation for some time.

Poppet was extremely conceited, and fond of 'shewing off.' The children of the village school used regularly to stop before the house to see the monkey, when she would dance up and down the boughs of the trees overhanging the lane, making an occasional wicked dash at the nearest little one, when the circle would break with a scamper and scream. She was very jealous of any child that came to the house, and once when a baby was the object of general admiration, managed to pinch its cheek. All the animals seemed to like her: the cat was her special friend; but when Pussy had four kittens, Poppet would turn the poor mother out of her bed, and nurse the babies herself; and very nicely she did it, sitting up, holding them properly, giving a funny little giggle when the little furry things tickled her. I am sorry to say she was not always so gentle, as she was met dragging a kitten down-stairs by the tip of its tail, thumping its little head on every step. The old mother came regularly to say good-morning to Poppet, making that caressing tone in which a cat speaks to its kittens. Poppet usually returned the attention by dragging open Pussy's mouth to see what she had had for breakfast. When she had finished her own morning meal, she would sit in the saucer and rock it up and down; or placing the saucer on her head, look like a little heathen Chinee.

At last Poppet got to be too expensive a luxury. In one week she broke an unusual number of valuable things. She began the campaign by dragging the breakfast-room clock and two large old china bowls off the chimney-piece; of course the china was smashed to atoms, and the clock so injured, that ever since its voice has been most painfully cracked. The next exploit was to send a large globe spinning down from a high bookcase, thereby breaking the stand to fragments. Then in a dance along the hall, she sprang on to one tip of a pair of immense horns, bringing them down, and causing them to snap on each side of the mounting.

Every one's patience was now exhausted, and 'Poppet must be got rid of!' was the universal cry. A visit was paid to a celebrated menagerie then in the town; but the monkeys' quarters were found so cold and dirty, and their little faces looked so sad and anxious compared to Poppet's contented well-fed look, that we decided it was impossible to send her there. It was useless to offer her to our friends; her fame had blown far and wide, and how we could keep 'such a tiresome mischievous creature' was the wonder of all who knew us. At last it was decided it would be more merciful to poison her than to give her where she would be ill-used or ill-fed. It was a cruel resolve, but what were we to do? The error had consisted in our ever trying to domesticate such an untamable creature. Poppet must die, and in as simple a way as possible. Prussic acid being said to be instantaneous, was to be the agent of destruction; and as I was supposed to have the most nerve in the family, notwithstanding my objections it was unanimously resolved I should administer it. The poison re-

mained under lock and key for some time; at last, worked up by several dreadful breakages, I gave it in some grapes, and retired from the room feeling like a murderer, leaving poor Poppet extended insensible on the rug. In about half an hour I returned, expecting to find her quite dead; but no; there she was, sitting on the fender, scratching her legs, and looking only a little languid. The revulsion of feeling was so great, and her invalid airs so comical and coaxing, that we felt rather ashamed of having attempted the life of so winning a creature. I may observe, however, that that feeling died away as she recovered and the old amount of mischief went on; and all looked very blue when some one read 'that monkeys frequently lived to be a hundred years old;' there seemed nothing for it but that Poppet should go as a family heirloom to the only son. Then it began to be whispered I might try another dose, but I steadily refused; till at the end of one hot summer afternoon which I had spent in my room, I went down-stairs, to find my mother looking very white, and hear her say: 'If I had known you were in the house I wouldn't have done it;' and to find that poor Poppet had been very effectually 'done for' at last; that for the first time in her little tricky roguish life she was really quiet. She was buried in the garden, and a headstone with a suitable inscription erected to her memory.

Now that the anguish for the loss of old friends (in glass and china) has been blunted by time, as we sit round the fire 'between the lights,' the recital of Poppet's pranks is listened to with rapt attention by the children; and I often think, with Frank Buckland, that many a more valuable friend may be less missed and less sincerely mourned than a pet monkey.

MY BABY.

THEY made a little crown in heaven

When she was born—

Only the breath of angels on it;

Neither flower nor leaf upon it;

Never a single thorn.

Slowly it grew in form and beauty

As the days passed on—

Tinted her eyes with love-light's dawning;

Ruby lips to love-words forming;

Lispings future song.

Brighter still the crown was budding

As the year grew old;

And my simple heart beguiling,

Angels shewed it to me smiling:

So the days grew cold.

'Look! O mother! look upon it!'

(Baby lay asleep);

'In the heavens' sunny bowers

Twine we everlasting flowers;

Think upon it in the hours

When you will weep!

'Look! O mother! fair we've made it

For an angel's head!'

There was something strange and wild

Struck my heart—the angels smiled:

I turned to look upon my child—

And she was dead.

CHARLES KINGSLEY AT HOME.

ALL who had the pleasure of knowing the Rev. Charles Kingsley, author of *Hyppatia*, *Westward Ho*, and *Alton Locke*, will acknowledge that however great he was as a parish clergyman, poet, novelist, naturalist, sportsman, he was greater still at home. And how was this greatness shewn? By his self-denying efforts to give joy to his wife and children, and chivalrously to take away from them whatever was painful. No man ever excelled him in the quality of being 'thoroughly domesticated.' In actual life we fear this is a rare attainment, for it is nothing less than the flower that indicates perfectly developed manhood or womanhood. This flower beautified and sweetened Canon Kingsley's life. He was a hero to those who had greater opportunities of knowing him than have most valets. Whatever unheroic cynics may say of the disenchanting power of intimacy, there was an exception in his case. How much such an example should teach us all! Not one in ten thousand can hope to become the many-sided man Kingsley was, but none of us need despair of making that little corner of the world called 'home' brighter and happier, as he made Eversley Rectory. We can all make our homes sweet if, when company-clothes are doffed, we clothe the most ordinary and commonplace duties of home-life with good temper and cheerfulness.

Because the Rectory-house was on low ground, the rector of Eversley, who considered violation of the divine laws of health a sort of acted blasphemy, built his children an outdoor nursery on the 'Mount,' where they kept books, toys, and tea-things, spending long happy days on the highest and loveliest point of moorland in the glebe; and there he would join them when his parish work was done, bringing them some fresh treasure picked up in his walk, a choice wild-flower or fern or rare beetle, sometimes a lizard or a field-mouse; ever waking up their sense of wonder, calling out their powers of observation, and teaching them lessons out of God's great green book, *without their knowing* they were learning. Out-of-doors and

indoors, the Sundays were the happiest days of the week to the children, though to their father the hardest. When his day's work was done, there was always the Sunday walk, in which each bird and plant and brook was pointed out to the children, as preaching sermons to Eyes, such as were not even dreamt of by people of the No-eyes species. Indoors the Sunday picture-books were brought out, and each child chose its subject for the father to draw, either some Bible story, or bird or beast or flower. In all ways he fostered in his children a love of animals. They were taught to handle without disgust toads, frogs, beetles, as works from the hand of a living God. His guests were surprised one morning at breakfast when his little girl ran up to the open window of the dining-room holding a long repulsive-looking worm in her hand: 'O daddy, look at this *delightful* worm!'

Kingsley had a horror of corporal punishment, not merely because it tends to produce antagonism between parent and child, but because he considered more than half the lying of children to be the result of fear of punishment. 'Do not train a child,' he said, 'as men train a horse, by letting anger and punishment be the *first* announcement of his having sinned. If you do, you induce two bad habits: first, the boy regards his parent with a kind of blind dread, as a being who *may* be offended by actions which to *him* are innocent, and whose wrath he expects to fall upon him at any moment in his most pure and unselfish happiness. Next, and worst still, the boy learns not to fear sin, but the punishment of it, and thus he learns to lie.' He was careful too not to confuse his children by a multiplicity of small rules. 'It is difficult enough to keep the Ten Commandments,' he would say, 'without making an eleventh in every direction.' He had no 'moods' with his family, for he cultivated, by strict self-discipline in the midst of worries and pressing business, a disengaged temper, that always enabled him to enter into other people's interests, and especially into children's playfulness. 'I wonder,' he would say, 'if there is so much laughing in any other home in

England as in ours.' He became a light-hearted boy in the presence of his children, or when exerting himself to cheer up his aged mother who lived with him. When nursery griefs and broken toys were taken to his study, he was never too busy to mend the toy and dry the tears. He held with Jean Paul Richter, that children have their 'days and hours of rain,' which parents should not take much notice of, either for anxiety or sermons, but should lightly pass over, except when they are symptoms of coming illness. And his knowledge of physiology enabled him to detect such symptoms. He recognised the fact, that weariness at lessons and sudden fits of obstinacy are not hastily to be treated as moral delinquencies, springing as they so often do from physical causes, which are best counteracted by cessation from work and change of scene.

How blessed is the son who can speak of his father as Charles Kingsley's eldest son does. "Perfect love casteth out fear," was the motto," he says, 'on which my father based his theory of bringing up children. From this and from the interest he took in their pursuits, their pleasures, trials, and even the petty details of their everyday life, there sprang up a friendship between father and children, that increased in intensity and depth with years. To speak for myself, he was the best friend—the only true friend I ever had. At once he was the most fatherly and the most unfatherly of fathers—fatherly in that he was our intimate friend and our self-constituted adviser; unfatherly in that our feeling for him lacked that fear and restraint that make boys call their father "the governor." Ours was the only household I ever saw in which there was no favouritism. It seemed as if in each of our different characters he took an equal pride, while he fully recognised their different traits of good or evil; for instead of having one code of social, moral, and physical laws laid down for one and all of us, each child became a separate study for him; and its little "diseases an moral," as he called them, were treated differently according to each different temperament. . . . Perhaps the brightest picture of the past that I look back to now is the drawing-room at Eversley in the evenings, when we were all at home and by ourselves. There he sat, with one hand in mother's, forgetting his own hard work in leading our fun and frolic, with a kindly smile on his lips, and a loving light in that bright gray eye, that made us feel that, in the broadest sense of the word, he was our father.'

Of this son, when he was an undergraduate at Cambridge, his father (then Professor of History) writes: 'Ah! what a blessing to be able to help him at last by teaching him something one's-self. And to a learned 'F.G.S.' he says very seriously: 'My eldest son is just going off to try his manhood in Colorado, United States. You will understand, therefore, that it is somewhat important to me just now whether the world be ruled by a just and wise God or by *O*.' It is also important to me with regard to my own boy's future, whether what is said to have happened to-morrow (Good Friday) be true or false.' In this way Kingsley educated his heart and became truly wise. For no matter how extensive may be our stock of information, we cannot be called wise unless heart become to head a helpmate.

And how well he used his matrimony—a state that should be to all the means of highest cul-

ture, or 'grace.' Sympathising with a husband's anxiety, he once wrote to a friend: 'I believe one never understands the blessed mystery of marriage till one has nursed a sick wife, nor understands either what treasures women are.' He believed in the eternity of marriage. 'So well and really married on earth' did he think himself, that in one of his letters he writes: 'If I do not love my wife body and soul as well there as I do here, then there is neither resurrection of my body nor of my soul, but of some other, and I shall not be I.' And again in another letter: 'If immortality is to include in my case identity of person, I shall feel to her for ever what I feel now. That feeling may be developed in ways which I do not expect; it may have provided for it forms of expression very different from any which are among the holiest sacraments of life. . . . Will not one of the properties of the spiritual body be, that it will be able to express that which the natural body only tries to express?'

Kingsley and his future wife met for the first time when he was only twenty years of age in Oxfordshire, where he was spending his college vacation. 'That was my real wedding-day,' he used always to say. The Cambridge undergraduate was at the time going through the crisis in a young man's life that may be called without irreverence 'moral measles.' He was then full of religious doubts; and his face, with its unsatisfied hungering look, bore witness to the state of his mind. He told her his doubts, and she told him her faith; and the positive, being stronger than the negative, so prevailed that he was no longer faithless but believing. Hitherto his peculiar character had not been understood, and his heart had been half asleep. It woke up now, and never slept again. For the first time he could speak with perfect freedom, and be met with answering sympathy. And gradually, as the new friendship deepened into intimacy, every doubt, every thought, every failing, every sin was laid bare. Counsel was asked and given; and as new hopes dawned, the look of hard defiance gave way to a wonderful humility and tenderness, which were his characteristics, with those who understood him, to his dying day. 'My memory often runs back,' writes an early friend of his, 'to the days when I used to meet dear Kingsley in his little curate rooms; when he told me of his attachment to one whom he feared he should never be able to marry.' But things turning out brighter than he expected, the same friend records how, calling at his cottage one morning, 'I found him almost beside himself, stamping his things into a portmanteau. "What is the matter, dear Kingsley?"—"I am engaged. I am going to see her *now*—to-day."

His chivalrous idea of wedlock was only natural, for he always attributed to Mrs Kingsley's sympathy and influence his success, saying that never but for her would he have become a writer. Writing to a friend on the subject of marriage, he says that it is his duty to hold the highest and most spiritual views, 'for God has shewed me these things in an eventful and blissful marriage history, and woe to me if I preach them not.'

Writing to his wife from the sea-side, where he had gone in search of health, he says: 'This place is perfect; but it seems a dream and imperfect without you. Kiss the darling ducks of children for me. How I long after them and their

prattle. I delight in all the little ones in the street, for their sake, and continually I start and fancy I hear their voices outside. You do not know how I love them; nor did I hardly till I came here. Absence quickens love into consciousness.—'Blessed be God for the rest, though I never before felt the loneliness of being without the beloved being whose every look, and word, and motion are the key-notes of my life. People talk of love ending at the altar. . . . Fools! I lay at the window all morning, thinking of nothing but home; how I long for it!'—'Tell Rose and Maurice that I have got two pair of bucks' horns—one for each of them, huge old fellows, almost as big as baby.'

Writing from France to 'my dear little man,' as he calls his youngest son (for whom he wrote the *Water Babies*), he says: 'There is a little Egyptian vulture here in the inn; ask mother to shew you his picture in the beginning of the Bird book.' When smarting from severe attacks on his historical teaching at Cambridge, he could write to his wife: 'I have been very unhappy about your unhappiness about me, and cannot bear to think of your having a pang on my account.' From America he writes: 'My digestion is perfect, and I am in high spirits. But I am home-sick at times, and would give a finger to be one hour with you and G. and M.'

From such things, which, though they may appear little, are really the great things of life, or at least its *heart's ease*, Canon Kingsley got power to do and to suffer.

Coming out from service in Westminster Abbey, he caught a cold; but he made light of it, for he could think of nothing but the joy of returning with his wife to Eversley for Christmas and the quiet winter's work. No sooner had they returned home than Mrs Kingsley became seriously ill. On being told that her life was in the greatest danger, Kingsley said: 'My own death-warrant was signed with those words.' His ministrations in his wife's sick-room shewed the intensity of his faith, as he strengthened the weak, encouraged the fearful speaking of an eternal reunion, of the indestructibility of that married love, which if genuine on earth, could only, he thought, be severed for a brief moment.

At this time Kingsley was himself ill, and on the 28th December he had to take to his bed, for symptoms of pneumonia came on rapidly. The weather was bitter, and he had been warned that his recovery depended on the same temperature being kept up in his bedroom and on his never leaving it; but one day he indiscreetly leaped out of bed, came into his wife's room for a few moments, and taking her hand in his, he said: 'This is heaven; don't speak;' but after a short silence, a severe fit of coughing came on, he could say nothing more, and they never met again. For a few days the sick husband and wife wrote to each other in pencil, but it then became 'too painful, too tantalising,' and the letters ceased. A few days after this, the preacher, poet, novelist, naturalist died, January 23, 1875, and was universally lamented, for England had lost one of her most estimable men—not great, in the ordinary sense of the word, for Kingsley could lay no claim to be a profound thinker. His philanthropy confused his perceptions, as when in his writings he denounced large towns and mill-owners, and

proposed to restore the population to the land. Such 'socialism' as this would throw us back into ignorance and poverty, instead of solving the difficult modern problem of rich and poor. Kingsley was great only as regards the feelings. There he may be said to have made his mark.

How many of Charles Kingsley's works will last? Some (with whom he himself would probably have agreed) think that *Hypatia* and a few songs, such as the *Sands of Dee* and *Three Fishers*, are his only contributions to English literature likely to endure. It may be that he had too many irons in the fire for any of them to become white-hot. We prefer to think of him as a minister of the Gospel, who not only preached piety but shewed it at home, by being a dutiful son, a wise father, and a husband whose love during thirty-six years 'never stooped from its lofty level to a hasty word, an impatient gesture, or a selfish act, in sickness or in health, in sunshine or in storm, by day or by night.'

'He was a true and perfect knight,' is our verdict, on rising from the perusal of his biography. It is surely a great encouragement to think that all who cultivate their hearts may, without his genius, hope to imitate the home-virtues of one who, however great in other respects, was, in our opinion, greater at home.

THE LAST OF THE HADDONS.

CHAPTER XXXVI.—WAGES.

AFTER the bride and bridegroom were gone, occurred the first slip in my behaviour. The rest of the company had returned to the house, and I suppose I must have stood in the road—gazing in the direction the carriage had taken, the sound of the distant bells floating faintly towards me in the summer air—so long as to be unconscious of the lapse of time, when gently and lightly a hand was laid upon mine, and it was drawn under Robert Wentworth's arm.

'You are wanted up there, Mary,' he said cheerfully. 'Mrs Tipper does not, I think, find herself quite equal to Mrs Dallas and Mrs Trafford; to say nothing of two discontented bride's-maids, and a father who came here under protest, and was only allowed to perform half the duty he came to perform. You took that out of his hands, you know; the giving away was virtually yours.' Going on to talk amusingly of the incongruous materials which went to make up the wedding-party, and so giving me time to recover my self-command. It was very soon put to the test. There was, to begin with, some pretty banter from Mrs Chichester to parry, when we reached the green terrace, where the guests were sitting, to enjoy the air and lovely view, and from which I suddenly remembered they could see the part of the road where I had been standing.

'We began to fear you must be ill, Miss Haddon, seeing you stand so long motionless in the road. It was quite a relief to see you move at last when Mr Wentworth joined you—it really was!'

Probably Robert Wentworth considered that this kind of thing was what I required, for he left me

to it, and devoted himself to the not very easy task of trying to reconcile the two pretty bride's-maids; gravely listening to their assurances that the whole affair had been shockingly mismanaged from first to last! I soon had enough to do to reply to the patter of questions with which I was assailed from Marian and Mrs Chichester.

Where in the world had I been hiding myself all these months? Had I really come into a large fortune, and turned Mr Dallas off, as people said; or was it the other thing? As I did not know what 'the other thing' was, I could not answer for that; but acknowledged to having been fortunate; smiling to myself as I wondered what they would think of my idea of good fortune. Of course they would know what my real position was in time; but for the present I was mischievous enough to let them imagine any improbable thing they pleased. But there was one thing which they must not be allowed to have any doubt about, and that was my regard for Philip and Lilian, and hearty concurrence in the marriage.

'I am so glad—so very glad; because we can now speak very decidedly upon the point. People are so terribly unkind and censorious; are they not, Miss Haddon?'

'Some are, Mrs Chichester; yet I think, on the whole, censorious people do a great deal less mischief than they are supposed to do. My experience is happily small in such matters; but I believe that censorious people are generally well known to be so, and therefore they are not capable of doing much harm.'

'Then it was *not* true, Miss Haddon; I am so very pleased to be able to say so!'

'What was not true, Mrs Chichester?'

'Oh, I would rather not repeat, really.'

'Well, I only know Caroline says she's heard it said over and over again that you ran away in despair, because you found that Mr Dallas and Lilian were untrue to you,' said Marian, less scrupulous about repeating than the other.

'That is really too ridiculous!' I ejaculated.—'But you will be able to tell your friend or friends that you did not see a love-lorn damsel to-day, Mrs Chichester;' gazing at her with steady calm eyes.

'You certainly don't look a bit love-lorn,' candidly said Marian.

'O no,' chimed in Mrs Chichester. 'If you will pardon the jest, I might say you looked a great deal more as though you had *found* a lover, than lost one!' with a meaning glance in Robert Wentworth's direction.

'Will you excuse my asking if you had that dress direct from Paris, Miss Haddon?' inquired Marian.

'Paris? No; it came from Madame Michaux,' I replied, happily recollecting that Jane had mentioned that name.

'Oh, that is the same thing; isn't it? She charges enormously; but one is quite sure of having just the right thing from her. I suppose you have all your dresses from her now?'

'No; not all,' I said, smiling at the remembrance of my every-day attire.

'They say brown is to be the new colour: the

Duchess of Meck—Meck—— (What's her name, Caroline? those German names are so absurd)—is wearing nothing else but brown at Homburg.'

'I have been wearing brown some time,' I replied, almost laughing outright.

'Some people always contrive to be in advance of the fashions,' she said a little disconcertedly. —'Are they going away already, Caroline; just inquire if the carriage is there, will you?—I see you have drab liveries, Miss Haddon; ours is changed to claret; the Marchioness of—— Breaking off to make a reply to a few words from the little bride's-maids, who with their father were taking themselves off from the uncongenial atmosphere. 'O yes; went off very nicely indeed; did it not? I wanted them to have the breakfast at Fairview, or at anyrate to have two or three of the men-servants to wait. But the party is small certainly, and everything has been very well contrived. No one is inclined to be very critical at such times. I hope you will be able to come down to Fairview before you return to Cornwall; any time which may suit you best. You need not write; we are always prepared for visitors.'

Both sisters hurriedly explained that their stay in town would be very short, and that there was not the slightest chance of their having a spare day.

Then there was one other little trial of my nerves—the few words which had to be spoken to Mr and Mrs Dallas; but pride came to my assistance, and I got through it pretty well, bearing their curious looks and gracious speeches with at anyrate apparent stoicism. Under other circumstances, I might have been somewhat amused by Mr Dallas's remark, that for his part he wished I had not thrown Philip over; accompanied as it was by a comprehensive glance at 'my carriage' waiting in the road below.

As soon as they left, I felt at liberty to whisper a loving good-bye to dear old Mrs Tipper, with a promise to see her and clear up all mysteries on the morrow, and take my departure. In a matter-of-course way, Robert Wentworth walked with me down the path, talking in the old pleasant easy fashion until he had put me into the carriage. Then just as I was bending forward to say the one word 'Home,' he gave the order 'Greybrook Hall.'

'Wait, John.'

The man stood aside; and I added to Robert Wentworth: 'You know then?'

'Of course I know,' he replied with a quiet smile.

I shrank back. He made a gesture to the footman, gave me the orthodox bow, and I was driven away.

Not a little agitated, I asked myself how much more did he know—all? If he recognised me that night in the wood, he did know not only what I had done, but what it had cost me to do it! I was no heroine; I have shewn myself as I was on Philip's wedding-day; but I had not won my peace without many a weary struggle for it. Once—three months after my departure from the cottage—I had stolen down in the darkness of evening to watch the shadows on the blinds, and perhaps catch the sound of a voice still so terribly dear to me. I saw Philip and Lilian together, and recognised that they were lovers, and then I knew that the victory was not yet won.

An hour later some one stooped over me as I lay crouched in the woods. 'Are you ill? What is the matter with you, good woman?' said the familiar voice of Robert Wentworth, as he laid his hand upon my shoulder. 'It is bad for you to be lying here this damp night.'

I shrank away, drawing the hood of my cloak more closely round my face, which I kept turned away. He stood still a few moments, and then without another word passed on. I had hitherto always persuaded myself that he had not recognised me; but now my cheeks grew uncomfortably hot with the suspicion that he did know me, and that the passing silently on was the very thing which a delicate consideration for me would prompt him to do. I was only surprised that it had not occurred to me before. I never had succeeded in throwing dust into Robert Wentworth's eyes when I had tried so to do. I knew now that it was to him Jane Osborne had alluded when she jested about a certain friend of hers who was so interested in all that concerned me, and whom I was to know more about by-and-by. I had sometimes a little murmured in my heart at having to give up Robert Wentworth's friendship with other things, knowing the worth of it, and he had been watching over me all the time! He had traced me at once; but respecting my desire to be lost to them all for a time, he had not obtruded himself upon me, contenting himself with obtaining an introduction to Jane Osborne and making friends with her.

That I had been watched over, had been shewn to me in more ways than one. I could almost smile now, holding the key, as I recollected many a little speech from Jane Osborne which seemed to breathe some stronger spirit than her own. Tenderly anxious about me, and inclined to pet me as she was, she would now and again spur me on to my work with a few words, which puzzled me extremely from her lips, but which I now could see she had been instigated to speak by one who knew me better than she did. But I had not much time for reflection; the drive was only three miles, and the ground very quickly got over by a couple of spirited horses. It seemed but a few moments after I had left Robert Wentworth in the road before I was at home.

It is now time to explain what has doubtlessly suggested itself to the reader, that I had been acting as superintendent of the Home for the last twelve months. Nancy had given me a hint that Mrs Gower had sent in her resignation of the office, having amassed a comfortable independence. My visit to town the day before I left the cottage had been for the purpose of seeing Mrs Osborne, the foundress of the Home, and I had the good fortune to find favour in her sight. She saw that it was a crisis in my life, and was inclined to be my friend had we two not needed each other. I went to stay with her a couple of days until Mrs Gower's departure, and then was duly installed in the latter's place.

As I expected that Lilian would hope to trace me through Nancy, the latter was drafted into Jane Osborne's establishment for a few weeks. Consequently, when Lilian made her appearance at the gates, she was informed that Nancy had gone to some lady whose address the portress for the nonce was not acquainted with. As I hoped she would, Lilian jumped to the conclusion that I was the

lady alluded to, and was thus thrown off the scent as to my whereabouts.

What shall I say—what ought I to say about my management of the Home? I think as little as possible. But I will say that my success has been greater than I dared to hope for, although I have had a great deal to unlearn as well as learn. All sorts of objections were in the outset made to what were termed my innovations, and perhaps they were rather daring; but I was beginning to be able to reply to objectors by more cogent means than words.

As to myself—could anything have been more delightfully refreshing to a wearied spirit than was the greeting which I received on entering the long room on my return that afternoon, a welcome from twenty smiling faces! It is the long room to which the reader has been previously introduced, with a difference; the high brick wall before the windows is gone, and a light palisading marks the boundary of the grounds, without obstructing the view, a very fine one, of the most beautiful part of Kent. Moreover, the room was to-day *en fête*; decorated with flowers and evergreens, and with a feast, almost as grand as that I had just been a guest at, spread upon the long tables in honour of my sister's wedding-day. I do not like to write the kind words of 'Welcome home' pattered out around me. Jane Osborne and I went to my room; and whilst I threw off my finery and slipped on my brown dress (the only badge of distinction between me and my protégées on ordinary days was my mother's ring), I set her mind at rest as to the state of mind in which I had returned.

After tea we had a reading. Reading aloud or music on certain evenings of the week, whilst the inmates worked, was another of my innovations. That night too we had a new arrival. As I afterwards learned, she had been sought out specially to be brought down there, and a new-comer was always under my particular care, and slept in the place of honour—a little room adjoining my own. Not a little astonished seemed the poor wail when ushered into our gaily bedecked room, and received as a welcome guest to our evening's entertainment. Perhaps my few words to that poor girl when I bade her good-night was as good a termination to Philip's wedding-day as could be desired for me.

A VISIT TO AMAZONIA.

THE Amazon, as is pretty well known, is a river of great length and more wonderful for its breadth in South America, entering the Atlantic between Brazil and Guiana. I am going to speak of Pará, a Brazilian port not far from the sea, to which I paid a visit, by what is known as the Pará estuary. The blue ocean had been left the day before. Passing some islands bearing clumps of palms, anchor was dropped in front of the city of Pará, a gun fired from the bridge, and immediately a fleet of shore-boats came off, keeping at a respectable distance, however, until the board of health, customs, and other formalities usual upon entering a Brazilian port had been observed; but no sooner had permission been given, than the deck was swarming with men seeking fares.

'You wan a boat go ashore, sir?' inquired a demure swarthy man about fifty, who stood twirling

his cap in hand; 'cos I take you for five shillings, carry what you got to hotel; an if you like to give me anything afterwards, much obliged.'

'That will do!' I returned. And in a few minutes we were speeding towards the landing-place—a flight of wooden steps, crowded with men and boys, anxious to know the latest home prices of india-rubber and other products. The heat was excessive. Not a breath of air stirred on shore; and although longing to ramble through the town, I felt it advisable to rest a while first; so we went direct to the Hotel de Commercio in the Rua da Industria, kept by M. Leduc, an enterprising Frenchman. Here, single rooms with food run from ten to fifteen shillings per diem. The food is excellent, everything considered; but the rooms are dirty and unfurnished, having each but one chair—invariably broken—a hammock slung in a corner, and a hard bed and straw bolster covered with but one sheet. The sanitary arrangements too are far from perfect.

Most places are celebrated for something; Pará is celebrated amongst other things for its bats. Enormous specimens, a foot or two across the wings, may be seen hanging to and fro about the veranda and bedrooms; beetles and cockroaches abound too; but there are places up the river where these are an infinitely greater plague.

The town of Pará is situated about seventy miles from the Atlantic. It has several spacious squares, such as the Praças do Cuartel, marine arsenal, government palace, and Mercado. If clangour of bells and cracking of rockets above steeples at high mass are indicative of religious enthusiasm, the Paraenses ought to be very devout. They certainly are not badly off for churches, of which I counted a considerable number.

The streets in this Brazilian town are laid out at right angles, upon the American block plan; half-a-dozen are paved with limestone from Lisbon—brought as ballast, which is cheaper than getting it from Rio Janeiro; and facing the river are a number of houses three stories high, some with staffs from upper balconies, from which droop consular flags. Elsewhere, dwelling-houses are usually one and two stories only. The favourite colour of Brazilians is green, and doors and windows, in fact every kind of wood-work, are as verdant as the forests that surround the town. Few shops boast of glass windows, on account of the deteriorative action of the sun upon goods exposed; but some wholesale firms exhibit a considerable variety of merchandise in their tunnel-shaped stores, where clerks are seen poring over ledgers in their shirt-sleeves. A seawall running the whole length of the river-frontage is in course of construction; and when finished, and the intervening space between it and the shore is filled up and built upon or paved, the appearance of the city will be decidedly enhanced, and its sanitary condition improved; for until recently, every kind of filth and rubbish was shot into the river, where at low-tide it generated a miasma enough to breed a pestilence.

Brazilians of social position rarely bring up their sons to trade, but strive to gain them government employ or entrance into one of the learned professions. It happens, however, that a university career is essential for the acquisition of a diploma; and as a large percentage of Brazilian youth entertain a hearty detestation for books, indolgent parents openly resort to influence, patron-

age, and intrigue, to enable their high-spirited though wonderfully delicate sons to live on the imperial exchequer. Paraense tradesmen are chiefly Portuguese; and it really is astonishing how rapidly one of these worthies gets on after his arrival in Pará; for he usually leaves the steerage of an English vessel with nothing but the clothes on his back, a strong constitution, and a bag of consecrated charms suspended from a string round his neck. Accustomed to hard work and poor fare at home, he considers himself well off with two mil reis or four shillings per diem; and as shibé or farinha and water is very filling, and goes down with a gusto if seasoned with an onion, he soon saves enough to purchase a horse and cart, or maybe send to Lisbon for a stout boat painted green and red. By thrift and economy his pile of mil rei notes steadily increases in dimensions; and one fine morning he opens a provision store and taberna, and begins to see his way to fortune. How complacently he smiles as he pours out vintenis-worth of cashaca to negro labourers! How carefully he weighs bacalhão and farinha for stout Cafuza women (half Indian and negro), who balance basins upon the head, smoke short wooden-stemmed black-bowled pipes, and walk about bare-footed with light print skirts and no body! He knows the reckless native has no thought for the morrow, but spends his money as fast as it is received.

Shortly after my arrival in Pará I was invited by Mr Henderson, a Scotch merchant, to take up my quarters in his charming rocinha at the outskirts of Nazaré, where I remained a little over three months. Our house was large and roomy, with immense wooden window-shutters, which were kept open from early morning till we retired at night, so as to admit as much fresh air as possible. The rainy season had set in, and every day we were favoured with a tropical thunderstorm of more or less violence. I often watched the approach of these storms from the dining-room balconies of Leduc's hotel, which command a splendid view of the river. Distant peals of thunder herald the coming storm, and gusts of wind that rattle shrunken doors and whistle through crazy windows, impart a welcome freshness to the sweltering stagnant air. Steamships at anchor have their funnels covered with snowy conical caps, to keep out the deluge; barges taking in or giving out cargo are hastily covered with tarpaulin; streets become deserted, except by vehicles drawn by miserable horses, that firmly compose themselves for a doze till the down-pour passes over; while clouds of vultures fly against the gale, to inhale as much fresh air as possible after their ghastly repast. A steady approaching line of dense gray clouds with a ragged blue fringe diminishes the horizon; thunder-claps grow louder and more frequent; big drops patter upon the red-tiled roofs; and then falls a deluge upon house-tops, that rolls into the streets below in a perfect cascade. Anything beyond ejaculatory conversation is quite out of the question, for the noise is simply deafening; and although, from the vivid flashes of lightning, we know it is thundering big-guns, we hear nothing beyond the crash of rain.

While the tempest lasts we tumble into our hammocks and endeavour to escape drops that trickle between the tiles; and in half an hour

proceed to the balcony to see how matters look outside. The storm has passed over, and the horizon grows clearer; the islands in front are lit up with rays of golden sunshine, that stream through rifts in the leaden clouds upon the emerald expanse of forest; sleepy horses are awoke by drivers, who hit them over the nose with a stick and inquire what is ailing; foot-passengers with coloured umbrellas pick their way tiptoe amid miniature lakes, seas, and channels that flood the road; steamboats are the cleaner for their washing; vultures stand upon houses, palacios, and churches, with wings outstretched to dry; and by-and-by in the azure heavens float mountains of fleecy clouds that playfully emit flashes of lightning as they collide, until night draws near; and as the sun sinks beneath the western forests, pale stars peep forth, proclaiming the close of another day.

Mr Henderson's house was so far distant from Pará that no noise reached us from the city excepting the occasional crack of a rocket, a faint bugle-call, or gun-fire of a boat announcing the arrival of a foreign mail. The noise of insect life, especially during the middle watches of the night, imparted a sense of loneliness, of being shut out from the world. There was an incessant hum, chirp, burr, and whirr, and every now and then a bull-frog would 'Woof, woof!' smaller frogs shout 'Hoy, hoy, hoy!' night-birds fly over the roof, emitting weird shrill cries; and what with the kissing conversation of bats, bites of sanguinary carpanás or mosquitoes, the tickling sensation of jiggers in my toes, and the fear of being wound up by a scorpion, centipede, tarantula, or maybe poisonous snake, I frequently kept awake till towards morning, when thoroughly overcome with watching and fatigue, I would fall into a profound and refreshing sleep.

At daybreak we always had a cup of delicious fragrant black coffee; and while the heavy dew spangled every leaf and blade of grass, I frequently went for a walk down the newly cut roads into the forest, when I would be sure to be overtaken by the early train going out with female slaves and batches of children of all shades of black, white, and copper colour, to breathe the cooler air of the forest glades. In anticipation of the probable extension of the city, an immense area of forest has been divided into blocks by spacious parallel avenues, to be intersected by streets at equidistant right angles. The open spaces are covered with short capim or grass; but however much one may delight to stroll about in the shade, he is sure to have his legs covered with an almost invisible mite called moquim, that causes an itch almost enough to drive one frantic, especially at night; and very likely a number of carrapatos into the bargain. It is dangerous to scratch where moquim have settled, for running sores difficult to heal usually follow. I have seen Europeans and North Americans from the States with legs in a frightful condition, in fact lamed through scratching the skin till sore. An immediate, agreeable, and effectual remedy against moquim, though they be ever so numerous, is to sponge the body with cashaça, the common white rum of the country. Carrapatos differ in size. These tiny pests are about as large as a pin's head; and the horse tick about three or four times larger still. Both settle upon the clothes, or crawl up the legs,

laying hold of the flesh with serrated fangs, and adhering so tenaciously that it is impossible to remove them entire; and to leave a portion sticking to the skin is certain to produce an ugly sore. The best way to get rid of this loathsome acaride is to sponge it well with spirits of any kind, when it will soon drop off; a hint which may be useful to Europeans who are pestered with harvest-bugs.

The forest round Pará naturally strikes a European as superlatively grand. It is only, however, upon interior high lands that vegetation attains the height, dimensions, and luxuriance that captivate and bewilder the senses. It wholly differs from anything found in temperate climes; and the stranger never tires of new forms of life and beauty that momentarily meet his gaze, and indicate an exuberance and prodigality surpassing his grandest ideal home conceptions. Accustomed only to individual forms as seen in home conservatories, the mind becomes bewildered when countless specimens of equatorial growth are massed together. Instead of gnarled and knotted oaks whose venerable appearance denote centuries of battle against fierce autumn storms and icy northern blasts, there is a lithe youthfulness even about veritable giants; and though a tree may be dead and hollow within, luxuriance of verdant parasitical plants lends a charming illusion, and hides the fact from view. Light, heat, air, and moisture are essential for the proper development of the richer forms of parasitical life; hence on water frontage and in some of the quiet avenues where I loved to stroll, I observed exhibitions of lavish profusion which rather resembled the dreams of fairyland than the realities of actual life. In one spot, a compact mass of tiny foliage would drape a number of lofty trees to the ground; in another, eccentrically arranged festoons and garlands sprinkled with occasional scarlet and violet passion-flowers decorated some hundreds of feet without a single break; while further on, endless picturesque, artistic, and graceful combinations ravished the sight, and awoke reverential and exquisitely happy emotions.

On both sides of avenues near the trees the ground is closely covered with beautiful lycopodium moss. Its favourite place of growth is on shady clearings, though it seems to grow best where timber has been burned on the ground. A foreigner desirous of learning how to take forest bearings without a compass cannot do better than cut his way into one of the furthest blocks in the district beyond Nazaré. He knows he cannot be lost, from the fact of roads existing on every side; hence he may go to work deliberately, and be under no apprehension as to result. In these spots where undergrowth has not been touched will be found solitary specimens of the curatá, a pretty ground-palm that shoots a number of long fronds from the centre, in which stands a smooth slender spathe, employed in thatching. The broken stems of slim palms shew where young assaí have been cut down for the sake of bunches of cherry-looking fruit employed in the manufacture of a refresco. Assaí is drunk by everybody in Amazonia when they can get it, at all hours of the day and before and after meals. Five or six gallons of the fruit, each about the size of a marble, are usually piled in a large iron basin containing a requisite proportion of water; the mass is then worked over and over till the outer pulpy skin is worked off; the bare kernels

are taken out, and at the bottom remains a rich violet-coloured liquid, that may be imbibed *ad lib.* It is best mixed with farinha seca and sugar, and eaten with a spoon. A liking for it is soon acquired, and it is not considered good taste to refuse a cuya or calabash of assai when offered by a lady.

Every shrub, plant, and tree, and almost every blade and leaf of grass, is covered with insect life. Ants are the most common, and meet the eye everywhere. It is impossible to go far without coming across tumuli of hard mud four feet high; and huge coffee-coloured excrescences standing out upon the trunks of trees indicate where copium or white ants have taken up their abode. A few days after my arrival at Mr Henderson's, I noticed the front of our house was covered with what appeared to me to be streaks of mud; and feeling convinced they had not been there the day before, I proceeded to examine them, and found the lines were neatly constructed covered-ways. Myriads of white ants were travelling backwards and forwards; and no doubt a colony had made up its mind to devour as much of the wood-work as possible, and by way of change, shew students how to rapidly get through and digest good books. I saw two volumes of *Chambers's Information* which had been drilled by these indefatigable workers as neatly as though the holes had been punched by an awl. The covered-way hides the workers from quick-sighted insectivorous birds, especially woodpeckers. Domestic fowls, lizards, toads, armadillos, and tamanduas destroy vast numbers. The largest and most numerous ants I have seen were in the Campos between the Xingu and Tapajóz. Near the hill-slopes a few miles from Santarem, it is simply impossible to preserve a house from attack, and very frequently a huge nest actually hangs from the ridge-pole. The ant, however, which attracts most attention is the saúba. It marches in columns, each member carrying a triangular or circular section of a leaf larger than itself. The only way to turn them from a garden is by sweeping the track with a flaming branch for a distance of forty or fifty yards; but as new excursions will probably be made during the night, one often finds that they have paid a visit and departed, leaving perhaps a favourite orange tree entirely denuded of foliage. A big ant called the tucandera is very common just outside Pará; indeed it is hardly possible to walk many yards in the forest without meeting it: the bite inflicts excruciating agony. I have never been stung by a scorpion or bitten by a centipede; but I have been nipped by a tucandera, and can quite believe that the pain inflicted is more severe than that of either of the two former.

What with the uproar of cicadas, chirping of grasshoppers, screaming of parrots, cawing of aráras or macaws (the cry of this splendidly plumaged bird closely resembles ára, arára, hence its name), plaintive notes of japiu and toucans, and numerous other indescribable sounds, the attention of the new-comer is kept continually upon the *qui vive* until eleven o'clock, when the intense oven-like heat warns him it is time to return. Emerging from the forest into one of the avenues the sun will be found nearly overhead; lizards of all sizes—that is to say from three inches to four feet in length—dart across the path and scuttle into the bush; and here and there a snake has to be guarded against, and if need be killed, with

the short sapling which every pedestrian ought to carry. Upon reaching home I usually took a bath, had a substantial breakfast, and rested till the unfailing thunderstorm cooled the atmosphere.

A QUEER CLUE.

IN TWO CHAPTERS.—CHAPTER II.

I HAD left the police altogether, and was living very comfortably, my good lady and I, up at Islington, in the same street with my married daughter, who was doing very comfortably too, her husband having a good berth in the City. I had always been of a saving turn, and had bought two or three houses; so with a tidy pension, which I had earned by thirty years' service, I could afford to go about a bit and enjoy myself. Of course in all that time I had made the acquaintance of a good many professional people; and there were very few theatres or exhibitions that I couldn't get admission to. We—my wife and I, I mean—made it a rule to go everywhere that we could get tickets for; and whether it was the launch of a ship, the charity children at St Paul's, or Sam Cowell at the Canterbury Hall, it didn't matter to us; we went. And it was at the Canterbury I first had the Combstead murder more particularly recalled to my mind.

I was there by myself, the old lady not being willing to leave my married daughter—because, well, it was in consequence of her being a married daughter—so I went by myself. There was a young woman who sang a comic version of *There's a good Time coming* splendidly; and as I was always of a chatty turn, I couldn't help remarking to the person that was sitting next to me how first-class she did it, when he exclaimed: 'Hollo! why, never! Superintendent Robinson?' And then he held out his hand.

It was young Lytherly, but so stout, and brown, and whiskery—if I may say so—that I didn't know him.

'Mr Lytherly!' I exclaimed, 'I didn't expect to see you; and you're right as to my being Robinson, although police officer no longer. Why, I thought you were in the army.'

'So I was,' he returned; 'but I'm out of it now; and I'll tell you how it was.'

It seems he had been to India, and got some promotion after three years' service; and had the good fortune to save his colonel from drowning, or what was more likely in those parts, being taken down by a crocodile, under circumstances of extraordinary bravery. He did not tell me this last bit, but I heard so afterwards. Lytherly was always a wonderful swimmer, and I remembered his taking a prize at London. The exertion or the wetting brought on a fever, and he was recommended for his discharge. The colonel behaved most liberally. But what was the best of all, the old fellow who kept the canteen at the station died about this time, and Lytherly had been courting his daughter for a good bit, more to the girl's satisfaction than that of her father; so then they got married, and came home to England, and he was tolerably well off. He naturally talked about the Combstead murder, and said frankly enough, that—except the people with whom he lodged, and they were suspected, he said, of perjury—he thought I was the

only person in the town who did not believe him guilty of the murder.

'But murder will out, Mr Robinson,' he said; 'and you will see this will be found out some day.'

'Well, I am sure I hope it will, Mr Lytherly,' I answered him. 'But as for "murder will out" and all that, I don't think you will find any policeman or magistrate who will agree with you there; and there was less to help us when you had got out of the scrape in this Combestead business, than any affair I was ever concerned in.'

'I don't care,' he says; 'it will come out, Mr Robinson. I dream of it almost every night; and my wife consulted some of the best fortune-tellers in India, and they all told her it would be discovered.'

'Hum!' I said; 'we don't think much of fortune-tellers here, you know.'

'I'm perfectly aware of that,' he says; 'and I shouldn't give them in as evidence; but if you had lived three years in India with people who knew the native ways, you might alter your mind about fortune-tellers. Anyway, you will remember, when it's found out, that I told you how it would be.'

I laughed, and said I should; and after we had had another glass together, and he had given me his address and made me promise to call on him, we parted.

I told my wife all about it; and it is very curious to see how women are all alike in curiosity and superstition and all that; for although my wife had been married to me for thirty years, and so had every opportunity of learning better, yet she caught at what young Lytherly—not so very young now, by-the-by—had said about these fortune-tellers, and was quite ready to believe and swear that the murder would be found out. It's no use arguing with a party like that; so I merely smiled at her, and passed it off.

It was the very next day that Mrs Robinson and myself had agreed to go and see a new exhibition of paintings which some one was starting in London, and tickets were pretty freely given away for it; but the same reason which stopped my wife from going to the Canterbury, stopped her from going to the exhibition. I went, of course, because I couldn't be of any use, under the circumstances, to my married daughter; and a very good exhibition it was too. There were plenty of paintings, and I had gone through all the rooms and entered the last one. There were very few persons, I was sorry to see, in the place, so that you could have an uninterrupted view of any picture you pleased. After glancing carelessly round the room, for one gets a kind of surfeited with pictures after a bit, I was struck by a gloomy-looking painting to the left of the doorway, and which I had not noticed on my first entry. When I came to look closer into it, I was more than struck—I was astounded. It was a picture representing the finding of old Trapbois the miser, in the *Fortunes of Nigel*. The heavy dull room was lighted only by the candle which the young nobleman held above his head; and it appeared to be excellently painted. But what drew my attention was that, as a part of the confusion in which the struggle between the old man and his murderers had placed the room, the washstand had been upset, had fallen into the fireplace, and the ewer had rolled into the grate, where it was shewn as unbroken, although the water was flooding the boards—all exactly as I had

seen the same things five years before—so exactly, that I was perfectly sure no chance coincidence had produced the resemblance, but that whoever had painted this picture had seen the room where Miss Parkway was murdered, and had had the features of the scene stamped on his memory. Who so likely to have the scene so stamped, I instantly thought, as the murderer himself? As this rushed on my mind, I could not repress an exclamation, although pretty well guarded as a rule. The only other person in the room heard me, and came to see what had excited me so strongly. Apparently, he was disappointed, for he looked from the picture to his catalogue, then to the picture again, then at me, back to his catalogue, and then went away with a discontented grunt. I did not move, however, but remained quite absorbed in the study of this mysterious painting; and the more I looked, the more convinced I became that it was copied from the scene of Miss Parkway's murder. There were several little points which I had not at first noticed, and in fact had quite forgotten; such as the position of the fire-irons, the direction in which the water had run, and so forth, which were all faithfully shewn in the picture. To be brief, I had made up my mind before I left the room that I had at last found the real clue to the Combestead murder.

The artist's name was Wyndham; and I determined that I would very soon, as a natural beginning, make some inquiries about this Mr Wyndham; and indeed I began before I left the exhibition. I engaged the hall-keeper to have a glass with me at the nearest tavern, and when I got fairly into conversation with him, asked carelessly where Mr Wyndham lived, as I thought I had known him many years ago, giving a description of some entirely imaginary person. The hall-keeper said: 'No—that was not the sort of man at all. Mr Wyndham was' (here he described him); 'and he doesn't live at the west-end of London, as you said, sir, but at a place in Essex, not very far from Colchester.' He knew where he lived, because he had several times posted letters to him at 'The Mount.' This was about all I got from the hall-keeper, but it was as much as I wanted.

I am not greatly in the habit of taking other people into my confidence, but this was altogether an exceptional case; so, after a little reflection, I went straight to the address John Lytherly had given me, and told him what I had seen. He of course introduced me to his wife, a very pretty dark-eyed young woman; and when I had told all, they exchanged looks less of surprise than triumph. 'Oh, it is coming all right!' he exclaimed. 'I knew the murder would cry out some day. And now you will have a little more respect for Indian fortune-tellers.'

'I am not quite sure about that,' I said. 'But don't you go making so certain that we are going to find out anything, Mr Lytherly: this may be only an accidental resemblance.' Because, as you may suppose, I had not told them how confident I felt in my own mind.

'Accidental! Nonsense!' was all he said to that; and then he asked me what was the first step I proposed to take. I told him that I thought we ought to go down to this village and see if we could learn anything suspicious about Mr Wyndham; and by my old detective habits, and the way in which the officers about would be

sure to help me, I thought we might reckon on finding out what was wanted. He was delighted, and asked when we should start, and when I said that very night, he was more delighted still.

It is always my rule to strike the iron while it's hot, and nothing could possibly be got by waiting now; so I had made up my mind just to run home, get a few things in my bag, and go down by the ten o'clock train. My wife, you may be sure, was very much astonished; but, as I expected she would be, was just as confident in the murder being found out as young Lytherly himself. Of course the latter was ready. And we were put down at our destination about twelve o'clock; too late for anything that night, but still we were on the spot to begin the first thing in the morning. And accordingly directly after breakfast we began. John Lytherly would have begun before breakfast, but as an old hand I knew better than that; because the party we were after, allowing he was the right party, after a five years' rest, wasn't going to bolt now; so it was no case for hurrying and driving. Well, soon after breakfast, I sauntered into the bar, and began talking with the landlord, who was an elderly sort of party about my own age, and who bragged—as if it was a thing to be proud of—before we had talked three minutes, that he had lived, man and boy, in Chumpley, which was the name of the lively place, for more than fifty years.

'Then you're just the fellow for me,' I thought; and then began talking of an old master of mine who was now living somewhere down in this neighbourhood, by the name of Wyndham.

'Wyndham? Let me see; Wyndham?' says the landlord, putting on his wisest look. 'No; I can't remember any party of that name. There's Wilkinson, and Wiggins; perhaps it's one of them.'

I told him they would not do; and then added, that the party I meant was something of an artist, painted pictures partly for pleasure and partly for profit. This was only a guess of mine, but it was a pretty safe one.

'Oh! there's lots of *them* about here!' exclaims the old boy, grinning very much, as if it was a capital idea. 'There's Mr De Lancy Chorkle, Miss Belvidera Smith, Mrs Galloo Whyte, Mr Hardy Canute, and a lot more; but I don't think there's a Wyndham.'

'Ah, well, it don't matter,' I said, very carelessly still; 'I may be mistaken. I heard, however, he lived down here at a place called the Mount. Is there such a place?'

'Is there such a place?' says the landlord, with as much contempt in his voice as if I ought to be ashamed of myself for not knowing. 'Yes, there is; and a first-rate gentleman artist lives there too; but his name ain't Wyndham; his name happens to be Parkway, sir, Mr Philip Parkway; though I have heard that he is too proud to paint under his own name.'

'I think, landlord,' I said, 'that I'll have just three-penn'orth of brandy, cold;' which I took, and left him without another word, for when I heard this name, I felt struck all of a heap, because it made a guess into a certainty, though in a way I had never dreamt of. I couldn't even go back to Lytherly for a little while; it was all so wonderful; and I was so angry with myself for never having thought at the time that the man who, of all others in the world, had the most to gain by

the poor woman's death, might have been the one who killed her. In the bitterness of my feeling I could not help saying that any one but a detective would have pounced upon this fellow at the first. However, I got over the vexation, and went back to Lytherly to tell him my news. We were each very confident that we had the right scent now; but yet it was not easy to see what we were to do. I could not very well apply for a warrant against a man because he had painted a picture; and so we walked and talked until we could think of nothing better than going down to Combstead, and with our fresh information to help us, seeing if we could not rake up something there.

We came to this resolution just as we reached a toll-gate, close by which stood a little house, which appeared to be the beer-shop, baker's, post-office, and grocer's for the neighbourhood. Not much of a neighbourhood, by-the-by, for, excepting a few gentlemen's seats, there was hardly another house within sight. One small but comfortable-looking residence, we were informed by the chatty old lady who owned the 'store,' was the Mount, where Mr Parkway lived. He was a very retired, silent sort of a gentleman, she said, and people thought his wife didn't have the happiest of lives with him. He had been married for a few years, the old lady went on; soon after a relation had died, and left him a good bit of money. Before that he only rented apartments in the village; but then he married Miss Dellar, who was an orphan, with a good bit of money too, but quite a girl to him, and they went to live at the Mount. At this point the old lady broke suddenly off, and said: 'Here they are!' going to the door immediately, and dropping her very best courtesies. We followed her into the little porch; and there, sure enough, was a low carriage, drawn by one horse, and in it sat a gloomy dark man, whom I had no difficulty in recognising, and by his side a slight, very pretty, but careworn-looking young woman. Mr Parkway looked coolly enough at us, and we as carelessly returned his glance, for we were both so much changed since the Combstead days, that there was little fear of his remembering us.

It seemed they had called about a servant which the post-office keeper was to have recommended, and Mrs Parkway alighted from the carriage to write some memorandum on the business. Parkway had never spoken, and I thought I could see in his harsh features traces of anxiety and remorse. Lytherly had followed Mrs Parkway into the shop, and, as I could see from where I stood, on the lady asking for a pen, he drew his gold pencil-case from his pocket, and offered it, as probably containing a better implement than any the post-office could afford. The lady stared, looked a little startled, but after a moment's hesitation accepted it with a very sweet smile. While Mrs Parkway was engaged in writing her letter, Lytherly stood by her side, and sauntered out after her. I had been waiting in the porch, watching her husband, whose face was so familiar to me that I half expected to see a look of recognition come into his eyes; but nothing of the sort happened. Lytherly watched them drive off, then turning suddenly round, exclaimed: 'It's as good as over, Robinson! We've got them!'

'Why, what is there afresh?' I asked.

'Just sufficient to hang the scoundrel,' said Lytherly. 'You remember, of course, that among

other things which were stolen on the night of the murder was a curious locket which poor Miss Parkway used to wear, and that some fragments of the chain were afterwards found.'

I remembered this very well, and told him so.

'Very good,' he continued. 'I gave that locket and chain to the poor old girl: it was the only valuable I possessed in the world; and Mrs Parkway has the central carbuncle in her brooch now.'

'Nonsense!' I exclaimed, not knowing exactly what I did say at the moment.

'It is a fact,' he said; 'and I can swear to it. What is more, to the point, perhaps, is, that although the stone is in a strange setting, and no one but myself, probably, could recognise it, yet I can identify it. On the side are my initials cut in almost microscopical characters. If they are there, that settles it; if they are not, put me down as an impostor, and fix the murder on me if you like.'

There was a good deal more said after this, but the upshot of it was that we went over to Colchester, and laid the matter before the authorities; when after a little hesitation, a warrant was granted for the apprehension of Mr Philip Parkway; and two officers, accompanied by Lytherly and myself, went over to execute it.

It was after nightfall when we arrived at the Mount; and on knocking at the door, we found that Mr Parkway was in; but his wife was out, having gone up (so the elderly woman that was called by the footboy informed us), to play the harmonium at the weekly rehearsal of the village choir. 'About the only amusement she has, poor thing,' the woman muttered, and she seemed in a very bad temper about something. We said we wanted to see her master, and that she need not announce us. And, as I live, I believe that woman guessed directly who we were, and what we had come for. At anyrate, quite a glow of triumph came into her face, and she pointed to a door nearly opposite to where we stood. We opened it, and found ourselves in a sort of large study, where, seated at a table, reading, was the man we wanted. He looked up in surprise as we entered, and the light falling strongly on his face, while all the rest of the room was in darkness, I thought I saw a paleness come and go on his gloomy features; but that might have been fancy.

'What is your business?' he began; but Mr Banes the chief constable cut him short.

'I am sorry to inform you, Mr Parkway,' he said, 'that I hold a warrant for your arrest, and you must consider yourself in custody.'

Parkway stared at him, mechanically closed the book he was reading, and said: 'On what charge, sir?'

'For murder,' says Banes; and then I was sure Parkway did turn very white. 'For the murder of Miss Parkway, at Combestead, in 186-.'

Parkway looked from one to the other of us for a few seconds without speaking; at last his eyes settled for an instant on Lytherly; then turning to Banes, he said, pointing straight at Lytherly: 'It was that man, I have no doubt, who set you on.'

'You had better not say anything, sir,' said the chief constable, 'but just give your servants what orders you wish, and come with us, as we cannot stop.'

'I daresay it was he,' continued Parkway, not answering Mr Banes, but seeming to go with his own thoughts. 'I fancied he was dead, for

what I took to be his ghost has been in my room every night for this month past.—Where is my wife?'

We told him she was not at home, and that we were anxious to spare her as far as possible; but he gave such a bitter smile, and said: 'She will certainly be vexed to have had a husband that was hanged; but she will be glad to be a widow on any terms.'

We didn't want to hear any more of this, so got him away; not without some little trouble though; and if there had not been so many of us, we should have had a scene; as it was, we were obliged to handcuff him.

The servants, four of them, were naturally alarmed, and were in the hall when we went out. Mr Parkway gave a very few directions, and the elderly woman grinned quite spitefully at him.

'Don't insult the man, now he's down,' I said in a whisper, while Parkway and the two officers got into the fly. Lytherly and I were to ride outside and drive.

'Insult him! the wretch!' she said. 'You don't mean to suppose he has any feelings to hurt. He has been trying to drive my poor young mistress—that I nursed when a baby—into her grave, and he would have done it, if I had not been here. The only excuse is, he is, and always has been, a dangerous lunatic.'

We drove off, and I saw no more of her, and never heard how Mrs Parkway took the intelligence.

The lady was present at the preliminary examination; and to her great surprise her carbuncle brooch was taken from her and used against her husband. This examination was on the next morning, and we obtained more evidence than we had at first expected. Not only was the carbuncle marked as Lytherly had said it would be, but I had been up at the station, being unable to shake off old habits, and had made some inquiries there. Strangely enough, the man who was head-porter now had been head-porter there five years ago (it is a very sensible way railways have of keeping a good man in the same position always; promotion generally upsets and confuses things); and he was able, by secondary facts, to fix the dates and to shew that not only did Mr Parkway go to Combestead for the funeral, but that he went to London and back just before; from London, of course, he could easily get to Combestead, and his absence left him about time to do so. We proposed then to have a remand and get evidence from Combestead; but it was never needed.

Parkway had been expecting this blow for years, and always kept some deadly poison concealed in the hollow of his watch-seal. This he took, on the night after his examination, and was found dead in his cell by the officer who went the rounds. He first wrote a very long and minute confession, or rather justification, shewing that his motive had been to prevent his cousin's marriage with Lytherly, whom he seemed to hate very much, although the young man had never harmed him. He said he went expressly to Combestead to get possession of the money his misguided relative had drawn, and to kill her. He felt that if he left her alive, she would carry out her scandalous plan, and therefore it was his duty to kill her; so in doing this he felt he had committed no crime, but had only been an instrument of justice. So

I suppose he was, as the housekeeper declared, a dangerous lunatic.

However, the reward of one hundred pounds had never been withdrawn, and I got it; it was paid out of Parkway's estate too, which was about the strangest go I ever heard of. Lytherly and his wife are great friends with Mrs Robinson and myself; indeed we have usually one of their young ones staying with us, when we haven't one or two from my married daughter. Mrs Parkway, I heard, sold off at the Mount, and went away; and some time after I saw by the papers that she was married to some one else. I hope she made a better match the second time.

On the whole, on looking back I am inclined to think that of all the clues by which I ever found anybody out, this was really the queerest.

THE MONGOOSE.

WE some time ago published an account of that deadly snake the Cobra, from the pen of a now well-known writer on Indian sports. In that paper it was given as the opinion of Dr Fayrer, author of a splendid work on Indian poisonous serpents, that a human being if bitten by a cobra in full vigour, was entirely beyond the reach of any known antidote; death was certain. In the following paper, which is from the pen of the author of the article above mentioned, some curious facts are adduced relative to the mongoose or ichneumon, an animal which is credited in many parts of India with being proof against snake-bite! With these few words of introduction, we leave our sporting friend to describe the little creature.

In countries where snakes and other noxious reptiles abound, nature, as a means of checking the excessive increase of such plagues, has provided certain animals, both biped and quadruped, which, by continually preying upon and destroying snakes of all kinds, both large and small, fulfil a most useful office, and confer an inestimable benefit on man. The peccary of South America, a small but fearless species of the hog-tribe, will not flinch from an encounter with such a terrible foe as the deadly rattlesnake; but encased in a hide of extreme toughness, quickly despatches and devours his scaly antagonist. The Secretary bird of Southern Africa, belonging to the falcon tribe, habitually subsists on reptiles of all kinds. In Europe the stork acts a similar part; and many other useful birds and beasts, performing the same good work, might be mentioned.

In India, where serpents are specially common and destructive to human life, we have various kinds of snake-devourers, such as storks and cranes and the well-known adjutant. Peafowl are especially active in destroying small descriptions of snakes; and others of the feathered race assist in the work. But in general, animals of all kinds have a natural dread, and carefully avoid permitting themselves to come in contact with, or even close proximity to a member of the snake-tribe, instinctively aware of the danger of meddling with such creatures.

The little ichneumon (a Greek word signifying a follower of the tracks or footsteps) or mongoose of India, is, however, a bright exception to this rule, for not only will he, when so disposed, without fear of consequences readily enter into mortal combat with the most venomous descriptions of snakes, but will even seek them out, attack, slay, and devour them, their young, or eggs, in their various strongholds and hiding-places.

The common gray mongoose (*Herpestes griseus*), called by the natives of Northern India 'Nôwêlâ,' is exceedingly abundant everywhere. In general shape and contour, though not in colour, it is much like a ferret, and in many other ways resembles one of the weasel tribe. In size it is considerably larger than a ferret; and the hair which covers the body, instead of lying smooth and feeling soft to the touch, as that of the ferret, is coarse and bristly. The colour, which varies much in different parts of the country and according to the season of the year, is generally of a reddish brown, speckled over with gray. Its length from tip of nose to tip of tail is about two feet. The snout is sharply pointed, ears short and round, eyes small and piercing; the jaws are armed with a formidable set of teeth, the canines being especially sharp and long.

The mongoose frequents gardens, thick hedges, and scrub jungle; and if left unmolested, and not hunted by dogs, will often take up its abode in some burrow or hole in a bank in close proximity to inhabited buildings. Though in general nocturnal in habits, yet it may often be seen crossing a road or footpath during the day, usually pausing a moment to look around and make sure that the coast is clear of dogs and such-like enemies before venturing to cross open ground. It possesses in common with the weasel tribe the habit of constantly sitting up on its hind legs to listen or obtain a better view around. I never, however, have observed it *feeding* in this position, like a squirrel, as has been stated to be the case. The mongoose has not the wandering propensities of the weasel tribe, one day here, the next miles away, but takes up its residence and remains in one particular spot, to which it returns, after roaming through the country around in search of food. A single animal, sometimes a pair, is usually seen at a time, seldom more; and I have never myself beheld, or heard of, large numbers travelling together, as we know stoats and weasels not unfrequently do. Though seldom if ever known to ascend trees, even when pursued by an enemy, the little creature may frequently be seen hunting about on the roofs of outhouses or deserted buildings of no great height, to which it has ascended probably by means of holes in the walls; but strictly speaking, the mongoose is not a climber, like the squirrel and marten.

Our little friend has been described as an excellent swimmer; but I imagine that it does not readily take to water, for I have never seen it swimming across streams or pools, though the banks of rivers, especially when honeycombed with

rat-holes, and affording cover to the animal's usual prey, are much frequented by it. It is an exceedingly courageous creature, and capable of inflicting severe punishment on animals far larger than itself, with its formidable teeth. A full-grown and powerful Tom-cat belonging to my regiment, the terror of all the squirrels in the neighbourhood, was worsted and most severely mauled in an encounter of his own seeking with a harmless mongoose. The latter surprised in the first instance and hard pressed by his opponent, turned on his assailant, and bit him through the face, inflicting so severe a wound, extending as it did from the corner of the eye to the mouth, that the aggressor was compelled to beat a retreat, having caught a regular Tartar. For many weeks we all thought that the sight of the injured optic was destroyed, though eventually the contrary proved to be the case; but puss for ever after carefully avoided seeking a quarrel with such an undaunted little champion.

The mongoose at times is mischievous; and not unfrequently during the night invades the poultry-yard; and when intent on making an entrance into a hen-roost, is a difficult thief to keep out, for the creature manages to creep through very small openings and crevices. Having once succeeded in forcing its way in, the mongoose, like many others of its tribe, not content with obtaining a single fowl sufficient to furnish a hearty meal, is given to the bad habit of slaying half a dozen or more unfortunates, which it never attempts to carry off, but leaves scattered about the floor.

In spite, however, of such small 'peccadillos' and insignificant petty thefts, which I believe are the sum-total of crimes which can be with justice laid to the charge of the little animal, the mongoose, on account of its many admirable qualities and the exceedingly useful office it fulfils, should ever be encouraged and protected by man. Not only does it continually hunt for and prey upon reptiles of various kinds, devouring their young and eggs alike, but cobras and other venomous snakes on becoming aware of such an active and dreaded little adversary being in their midst, speedily leave such a neighbourhood, and betake themselves to other and safer quarters; and as we know that the smell of a cat suffices to keep away rats and mice from our dwellings, so in like manner will a mongoose, by continually prowling about a house, in a great measure free the premises from snakes, rats, mice, and such vermin.

The mongoose in its wild state, if kindly treated, fed with milk, and made a welcome visitant, speedily loses its natural fear of human beings, and not only will pass along the veranda of a house, but if unmolested, soon learns to cross from one room to another by an open door or window. When captured young, it is very easily reared and domesticated, and soon becomes familiarised with the loss of liberty. It is cleanly in its habits, and has no offensive odour pertaining to it, like many of its tribe. It will trot about after its owner like a dog or cat, and even permit children to handle or play with it, without attempting to bite or scratch them. I have seen one curled up asleep in a lady's lap. They are special favourites of the British soldiers in the barracks, and dozens of such pets may be seen in a single building.

Being, as I have already stated, a deadly foe to

the cobra, battles between that formidable reptile and the mongoose are of constant occurrence; but I never have had the good fortune to witness a combat between the two animals in *their wild state*, though I have several times seen large and formidable snakes despatched within a few minutes of the commencement of the fight, by tame ichneumons; and I imagine that the tactics employed on both sides are much the same whether the champions have casually met in the jungle, or the duel has been arranged for them by human beings.

In the various encounters which I have personally witnessed between mongoose and cobra, the former invariably came off the victor, and that without apparently receiving a wound. The little animal always adopted the same tactics, vigorously attacking the snake by circling round it and springing at its throat or head, but at the same time with wonderful skill and quickness avoiding the counter-strokes of its dangerous enemy; till at length waiting for a favourable opportunity—when the snake had become to a certain extent exhausted by its exertions—the nimble little quadruped would suddenly dart forward, and, so to speak, getting under its opponent's guard, end the fight by delivering a crunching bite through the cobra's skull.

In none of the half-dozen battles which I have witnessed has there been an attempt on the part of the mongoose to 'extract the serpent's fangs' (as some recent writers have described); though more than once, after gaining the victory, the animal has commenced to ravenously devour its late opponent. Possibly these poor creatures, that shewed so inordinate a desire for food, had been intentionally starved for the occasion by their owners, to make them the more eager to engage and overcome the cobra so soon as let loose, and thus without fail or delay to insure a pitched battle for the benefit of the spectators.

As the reader is probably aware, these combats between mongoose and cobra have given rise to many differences of opinion and disputes among naturalists; though I think that the careful inquiries and numberless experiments made by scientific men in late years have done much to clear up these old points of contention, and at the same time have put to flight many delusions no longer tenable. For instance, a common belief formerly prevailed 'that a mongoose, when bitten in an engagement with a cobra or other venomous snake, was in the habit of eating some kind of plant or root, which altogether nullified the effects of the poison.' This extraordinary idea yet prevails in some parts of India among certain classes of natives, who to this day maintain that the mongoose, by means of some such specific as I have mentioned, works a self-cure when bitten by a venomous reptile. But it is a well-known fact that many tribes and castes are exceedingly superstitious and obstinate, pertinaciously clinging to the convictions, maxims, and customs handed down to them by their forefathers; and with such people it is, generally speaking, useless to enter into an argument.

We shall now proceed to consider a second and far more difficult point to determine, and which, I think, yet remains a vexed question, requiring further investigation. I refer to the supposition, which many maintain, 'that the poison

from the fangs of venomous snakes, though so fatal in its results with most living creatures, is *innocuous to the genus to which the mongoose belongs*, and that one of these animals, beyond suffering pain from the bite of a cobra, sustains no further harm or inconvenience.'

Many strong and weighty arguments have been urged in support of this theory; and perhaps the most remarkable that has ever been brought before the public appeared many years ago in an article published in the *Churchman's Magazine*, entitled 'A Question in Natural History settled at last.' The writer, after ably sustaining his view of the question, concludes by publishing at length a most interesting communication from India, giving a detailed account of a prolonged and bloody engagement between mongoose and cobra. This letter was signed by three officers of the Indian army, witnesses of the combat, and who vouched for the strict accuracy of the report. The particulars of this desperate duel, which actually lasted three-quarters of an hour, with the various changes and incidents as the combat proceeded, are minutely described; but after a gallantly contested battle, the mongoose proved the victor, and the cobra was overcome and slain. The former, however, did not come off scathless, but, on the contrary, received several wounds, including one of great severity.

When the encounter was over, the witnesses proceeded to carefully examine, with a magnifying glass, the wounds which the mongoose had received, in order to ascertain and satisfy themselves of their extent and nature; and mark the important discovery brought to light by aid of the lens. I will quote the concluding words of the narrative: 'On washing away the blood from one of these places the lens disclosed the *broken fang of the cobra deeply imbedded in the head of the mongoose*. . . . We have had the mongoose confined ever since (now four days ago), and it is now as healthy and lively as ever.'

It cannot be denied that such clear and trustworthy evidence as this carries considerable weight with it, and tends to bear out the writer's view of the question. On the other hand, to deal impartially, it is right to point out one or two weak points in carrying out this otherwise well-conducted experiment, and which somewhat detract from the results and consequent opinions arrived at.

In the first place, we are told that the cobra was only three feet long, undoubtedly a very small one; and further, that previous to engaging the mongoose, to make sure that the reptile was in full possession of its fatal powers, it was made to bite a fowl, which died soon after. This certainly clearly proved that the snake's deadly machinery was in full working order. But the experimentalists appear to have forgotten that by this very act they were in a measure disarming the cobra, for it is a well-known fact that the *first* bite of a venomous snake is most to be feared; and that a second bite by the same reptile, if delivered shortly after the first, owing to the poison having been partially exhausted by the first effort, is less deadly in its effects.

So that, all things considered, and fully allowing that this account strengthens the assertion that the mongoose is really proof against the effects of snake-poison, I am yet of opinion that the question is not finally and conclusively settled, more

especially as later experiments, quite as fairly and carefully carried out, have terminated differently, and resulted in the death of the plucky little fellow.

SOME CURIOUS COINCIDENCES.

It has often been jocularly said that no family can have any right to call itself 'old' unless it has its 'family ghost.' As regards the Highlands of Scotland, we may substitute for the ghost the inevitable 'doom,' or prediction foretelling future weal or woe to the family. Almost every old Highland house has its 'prophecy' of this kind, such as the Argyll and Breadalbane predictions, the 'Fate of Seaforth,' the 'Fall and Rise of Macleod,' and many others well known in the north. The great majority of the families so gifted have had of course no events in their history that even the credulity of their retainers in the past could twist into a fulfilment of the predictions; but in a few cases there have been some curious coincidences between the old traditions and the facts of a later time.

We propose to select one or two well authenticated instances of such coincidences from among a mass of Highland superstition in a little book that has recently been published at Inverness entitled *The Prophecies of the Brahan Seer*, by Alexander Mackenzie (Inverness: A. and W. Mackenzie). This pamphlet is a collection of most of the traditional 'prophecies' attributed to an apocryphal Ross-shire seer of the seventeenth century, and which have been handed down by oral tradition from generation to generation in the Highlands since that time. In the north, the popular faith in this prophet *Coinneach Odhar* or 'Dun Kenneth' and his predictions has been and is both strong and wide, says Mr Mackenzie, who thinks the legends worthy of preservation, as an additional chapter 'both remarkable and curious, to the already extensive history of the marvellous.' At any rate, these legends are of some interest as illustrations of the superstition and credulity of the Highlanders of the last century, and perhaps even of this; but our purpose leaves untouched the wilder traditions in this collection, and deals only with two episodes in the histories of two great families of the north.

Sir Edmund Burke in his *Vicissitudes of Families* has a weird chapter on 'the Fate of Seaforth,' in which he gives at full length the doom of this family, as pronounced by the 'Warlock of the Glen' (as Sir Edmund calls Dun Kenneth), and its fulfilment a century and a half after it was spoken. Burke seemingly accepts as fact (as does Mr Mackenzie) the purely mythical story of the seer and his cruel fate—how, being a clansman of Seaforth, and famed for his prophetic skill, he was called on by his chief's wife to explain why her husband staid so long in Paris, whither he had gone on business soon after the Restoration; how the Warlock, unwilling at first to tell what his uncanny gift shewed him, at last was forced to say that the Lord of Kintail was forgetting home and Lady Isabel in the smiles of a French lady; how the angry countess, furious that he should have so slandered his chief before his clansmen, ordered the seer to be burned to death—another instance of the proverbial 'honour' in which prophets are held in their own country. As he was dying at the stake, Kenneth uttered a

weird prediction foretelling the downfall of the Seaforths for Lady Isabel's crime. So runs the legend. It is quite certain that a prediction regarding the Seaforth family was well known in the Highlands long before the days of the last chief of Kintail. We have Lockhart's authority for the fact that both Sir Humphry Davy and Sir Walter Scott knew and believed it. 'I do fear the accomplishment of the prophecy,' writes Scott in another place to his friend Morrilt of Rokeby, who himself testifies that he heard it quoted in the Highlands at a time when Lord Seaforth had two sons both alive and in good health. This prediction ran, that the house of Seaforth would fall when there should be a deaf and dumb earl who should sell Kintail (the 'gift-land' of his house); that this earl would have three sons, all of whom he should survive; that four great Highland lairds, his contemporaries, should each have certain physical defects, which were named; that the Seaforths estates should go to 'a white-hooded lassie from the East,' who should be the cause of her sister's death.

With all these particulars the facts coincided exactly. Francis Humberstone Mackenzie, the last Seaforth, became deaf from an attack of fever while at school, and latterly also became dumb. His remarkable life is well known: he raised from his clan the 78th Highlanders, and subsequently rose to be a lieutenant-general in the army and governor of various colonies. Scott, whose great friend he was, says he was a man 'of extraordinary talents, who must have made for himself a lasting reputation, had not his political exertions been checked by painful natural infirmity.' He was the happy father of three sons and six daughters, all of high promise; but the end of his life was darkened by misfortunes. Two of his sons died suddenly; and in 1814, William, his last hope—M. P. for his native county, and a young man of great abilities—sickened of a lingering disease, and died about the time that losses in the West Indies necessitated the sale of Kintail. In January following, the old man, broken-hearted at the loss of his three sons, died; and then, as Scott says:

Of the line of Mackenneth remained not a male
To bear the proud name of the chiefs of Kintail.

The estates went to his eldest daughter, the widow of Admiral Sir Samuel Hood, who was on her way home from India when her father died. The four Highland lairds, friends of Earl Francis, were all distinguished by the peculiar personal marks which were mentioned in the prediction; and to make the coincidence complete, Lady Hood—then Mrs Stewart Mackenzie—many years afterwards may be said to have been the innocent cause of her sister's death, for when she was driving Miss Caroline Mackenzie in a pony-carriage, the ponies ran away, the ladies were thrown out, and Miss Mackenzie killed!

So much for this strange chapter in family history. Let us now glance at the records of another family—equally famous in the Highlands—where the prediction, as a whole, has not been fulfilled, though enough has happened here also to make the coincidence very striking. Our authority in this case is the Rev. Norman Macleod, father of the late Dr Norman Macleod. In the appendix to Dr Norman's *Life* by his brother are given a series of reminiscences dictated in his old age by their father. He says that in the summer of 1799

he visited Dunvegan Castle in Skye, the old stronghold of the Macleods. 'One circumstance took place at the castle on this occasion which I think worth recording, especially as I am the only person now living who can attest the truth of it. There had been a traditionary prophecy, couched in Gaelic verse, regarding the family of Macleod, which on this occasion received a most extraordinary fulfilment. This prophecy I have heard repeated by several persons. . . It was prophesied at least a hundred years prior to the circumstance I am about to relate.' This prediction shortly was, that when 'Norman, the third Norman,' should meet an accidental death; when the rocks on the coast of Macleod's country called the 'Maidens' became the property of a Campbell; when a fox had young ones in the castle; and when the 'Fairy Banner' should be for the last time shewn—the glory of Macleod should depart for a time; the estates be sold to others. But that again in the far future another Macleod should redeem the property and raise the family higher than ever. Now comes the curious coincidence told by Mr Macleod.

An English smith at Dunvegan told him one day that next morning he was going to the castle to force open the iron chest in which the 'fairy flag' of the Macleods had lain for ages undisturbed. Mr Macleod was very anxious to be present, and at last he got permission from 'the factor,' upon condition that he told no one of the name of Macleod—the chief included—what was to be done. The smith tore off the lid of the box, and the famous old flag was exposed—'a square piece of very rich silk, with crosses wrought with gold-thread, and several elf-spots stitched with great care on different parts of it.' Very soon after this, Mr Macleod goes on to say, 'the melancholy news of the death of the young and promising heir of Macleod reached the castle. "Norman, the third Norman," was a lieutenant of H.M.S. the *Queen Charlotte*, which was blown up at sea, and he and the rest perished. At the same time, the rocks called "Macleod's Maidens" were sold in the course of that very week to Angus Campbell of Eusay; and they are still in possession of his grandson. A fox in possession of a Lieutenant Maclean residing in the west turret of the castle, had young ones, which I handled. And thus all that was said in the prophecy alluded to was so far fulfilled; although I am glad the family of my chief still enjoy their ancestral possessions, and the worst part of the prophecy accordingly remains unverified. I merely state the facts of the case as they occurred, without expressing any opinion whatever as to the nature of these traditionary legends with which they were connected.'

A coincidence as remarkable as any of these is the one Mr Wilkie Collins notices in connection with his novel *Armadale*. Readers of that powerful story will recollect what an important part the fatal effects of sleeping in poisoned and foul air play in it. They, writes Mr Wilkie Collins, 'may be interested in hearing of a coincidence relating to the present story which actually happened, and which in the matter of "extravagant improbability" sets anything of the same kind that a novelist could imagine at flat defiance. In November 1865—that is to say, when thirteen monthly parts of *Armadale* had been published, and I may add, when more than a year and a half had elapsed since the end of the story, as it

now appears, was first sketched in my note-book—a vessel lay in the Huskisson Dock at Liverpool, which was looked after by one man, who slept on board, in the capacity of ship-keeper. On a certain day in the week this man was found dead in the deck-house. On the next day a second man, who had taken his place, was carried dying to the Northern Hospital. On the third day a third ship-keeper was appointed, and was found dead in the deck-house, which had already proved fatal to the other two. *The name of that ship was the Armadale.* And the proceedings at the inquest proved that the three men had all been suffocated by sleeping in poisoned air.' The case, Mr Collins goes on to say, 'was noticed—to give two instances in which I can cite the dates—in the *Times* of November 30, 1865, and was more fully described in the *Daily News* of November 28, in the same year.'

MUSHROOM CULTIVATION IN JAPAN.

In pursuance of a plan commenced a short time back of furnishing information respecting the staple products of Japan, their culture or preparation, Her Majesty's Consul at Yokohama, in his published Report to the Foreign Office, deals, among other matters, with the cultivation, &c. of mushrooms; and as that subject is a novel one in this country, some brief account of the process may not be unacceptable to our readers. The best of the edible species of mushrooms are known to the Japanese as *matsu-také* and *shii-také*. The difficulties experienced in preserving the former kind prevent their being available for export, added to which, even when successfully dried, they are nearly tasteless; the *shii-také*, on the other hand, have this peculiar excellence, that though they are all but tasteless in their raw state, they have an extremely fine flavour when they are dried. The quantity that grows naturally on the decayed roots or cut stumps of the *shii* tree is not sufficient to meet the demand, and consequently much skill has been brought to bear on their cultivation, notably by cutting off the trunks of the *shii* and other trees, and forcing the growth of the mushrooms on them. Different varieties of oak are most in favour with the Japanese for the cultivation of mushrooms, the one just mentioned being considered to give the best results. The tree grows abundantly in warm places with a south-easterly aspect, and attains a height of about eighteen or nineteen feet. It is an evergreen, bearing small acorns, which are steamed and eaten; the wood is used for making boats' oars, charcoal, &c. Another oak, the *kashiwa*, from which mushrooms are obtained, is also plentiful in warm localities, and grows to a height of thirty or forty feet; its leaves are used in cookery, and the wood is in great demand for divining-sticks. A third description of oak, the *donguri*, is found all over the country; and its acorns, after being pounded and steeped in water, are made into dumplings.

Mushrooms, we are told, are obtained from any of the above-mentioned trees in the following manner: about the beginning of autumn a trunk five or six inches in diameter is selected and cut up into lengths of four or five feet; each log is then split into four pieces; and on the outer bark slight incisions are made at once with a hatchet, or else the logs are left till the following spring,

when deep cuts are made in them. Assuming the former course to have been pursued, the logs, after having received several slight incisions, are placed in a wood where they can get the full benefit of the air and heat; and in about three years they will have become tolerably rotten in parts. After the more rotten parts have been removed, they are placed in a slanting position; and about the middle of the ensuing spring the mushrooms will come forth in abundance. After these have been gathered, the logs are still kept, and submitted to the following process. Every morning they are steeped in water, and in the afternoon they are taken out and beaten with a mallet; they are then ranged on end in the same slanting position as before; and in two or three days' time mushrooms will again make their appearance. In some places it is the custom to beat the logs so heavily that the wood swells, and this seems to induce the growth of mushrooms of more than ordinarily large size. If, however, the logs are beaten gently, a great number of small mushrooms grow up in succession. Another mode of forcing the growth of mushrooms is to bury the cut logs at once in the earth, and after the lapse of a year, to take them out and treat them in the manner just described.

The mushrooms thus grown are stored in a barn on shelves ranged along three sides, with braziers lighted underneath. Afterwards they are put into small boxes, the bottoms of which are lined with either straw or bamboo mats; these are placed on the shelves, and gradually dried with great care. Another mode of drying mushrooms is to string them on thin slips of bamboo, which are piled together near the brazier, the heat being kept in by inverting a closely woven basket over them.

Of other edible mushrooms in Japan besides the *shii-také*, Mr Robertson particularises the following: The *kikurage*, which grows in spring, summer, and autumn, on the mulberry, the willow, and other trees; it is a small, thin, and soft mushroom, very much marked at the edge, and of a brownish tinge. The *ura-také*, which grows on rocks in thick masses. The *so-také*, a very delicately flavoured mushroom, which is found on precipitous crags, and is consequently scarce, owing to the difficulties attendant upon its collection. The *kawa-také*, a funnel-shaped mushroom with a long hollow stalk, which is found in shady spots on moorland.

By adopting a somewhat similar plan of forcing mushrooms in Great Britain, it is quite possible that growers might find it to their advantage.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'
- 2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.
- 3d. Manuscripts should bear the author's full CHRISTIAN name, surname, and address, legibly written.
- 4th. MS. should be written on one side of the leaf only.
- 5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

AIR AND WATER POLLUTION.

WE have been lately staying at a pleasant sea-side resort. The stretch of sands on the beach is beautiful, the houses generally well built and commodious, the accommodation for strangers excellent. With much to commend, one thing struck us as very anomalous. There are several factories, including one or two bottle-works, and from these are almost constantly sent forth huge volumes of dense black smoke, which according to the direction of the wind, pour across the otherwise fair scene, and tend greatly to pollute the atmosphere. Now, this we presume to think is a serious encroachment on public rights. Nature beneficently provides a pure atmosphere, which all may enjoy, and that will be favourable to vegetable growth. Despising this primary principle, and acting only from sheer selfishness, certain individuals, ordinarily known as capitalists, set up factories with tall brick chimneys, from which are vomited those hideously dark masses of coal-smoke, in defiance of good taste, decency, and common-sense. We had almost said in defiance of honesty, because the air of heaven is a universal inheritance, and the pollution of it for selfish ends is, morally speaking, little better than picking a pocket. Yet, how much of this aggressive dishonesty is habitually practised! The air of towns and villages is polluted. Some of the most beautiful rural scenes are polluted. Over charming dells, clothed in natural shrubbery and flowers, to which one would like to flee and be at rest, is seen hovering a pall of black smoke, projected from some sort of factory or a paper-mill, and doing its best to transform beauty into ugliness. Surely, to speak mildly, that is a public wrong.

Travelling through England, and entering what are termed the manufacturing districts, we come upon the Smoke Demon in full blast. Who, for example, can forget the revolting aspect presented by Sheffield or Wigan? The sky hidden by dark smoke, the houses begrimed, and the land blighted, as if saturated with coal-culm. Obviously, there is a prevailing sootiness; and speculating as to how

people can possibly live amidst such horrors, we think with a feeling of relief of the joy they possibly experience when on Sunday the chimneys cease to smoke, the blue firmament is suffered to be unveiled, and children are able to fill their lungs with air comparatively free from impurity. Even in the neighbourhood of towns not absolutely of the manufacturing class, the tourist is pained to observe what atmospheric deteriorations are caused by smoke. In few places nowadays are there not tokens of industry involving the application of steam-power. Tall chimneys are apt to start up where least expected, with the usual results. These brick chimneys are not usually an embellishment to the landscape; but we raise no objection to them on this ground. Required for purposes of manufacture, and valuable in connection with the employment of large numbers of persons, they may be viewed as indispensable adjuncts in promoting commercial prosperity, and increasing the national wealth. Accordingly, it is not the chimney-stalks we find fault with; it is the vast masses of smoke that needlessly issues from them, which at a very small expense and a slight degree of care, could be effectually prevented. For want of this reasonable amount of care, the green fields in the vicinity of the chimneys cease to be green. The soot falling on the pasturage, defiles the herbage; and the poor sheep and lambs, born to experience the vicissitudes of weather, but at least to wear clean wool upon their backs, are as dingy as professional chimney-sweeps. Unmistakably, they have been besmirched by the Smoke Demon, who in his iniquitous visitations respects neither man nor beast, and is apparently indifferent to what becomes of the whole animal and vegetable creation. Perish the comfort of everybody; let smoke in any measure of density have its sway! That is the doctrine of greed predominant in this wonderfully advanced nineteenth century, which some people are never done eulogising.

We see a curious instance of the Smoke Demon's proceedings in a reputedly fashionable part of a large city. A piece of land had just been laid out

in the building of mansions of a superior class—not one of them valued at less than seven or eight thousand pounds—when lo and behold the purchasers of the newly erected edifices find to their consternation that the tall chimney of an unexpected factory has begun to belch volumes of black smoke into their back-windows all day long! The chimney—that of a perfectly respectable flour-mill, we believe—is unexceptionable as regards chimney architecture. It is tall and handsomely tapered; but what signifies these commendable qualities? There, from morning to night, goes its smoke, polluting the atmosphere in the bedrooms, killing the flowers in the conservatories, odious and sickening in all directions. Very hard this on the purchasers of these splendid mansions. They have got unexceptionably good houses, but with what an atmospheric drawback!

Why, however, should municipal authorities tolerate such abominations? Yes, why should they? There exist in many places police edicts designed to quench the Smoke Demon. Through the vigilance of the authorities, the smoke nuisance in London has been immensely modified within our recollection. In some large provincial towns it has likewise been materially abated. But taking the country at large, it is about as bad as ever. The evil has little chance of being thoroughly mastered by any local magistracy. The very authorities who should stamp out the abomination are likely enough to be the evil-doers themselves, or are at least so compromised by surrounding influences as purposely in this particular to neglect the interests of the community. Besides, to put existing and not very distinct laws in motion, a heavy expense is liable to be incurred. And local authorities of all kinds do not like to encounter litigation unless strongly urged by public clamour and backed by persons of note, who do not mind to take trouble and share part of the cost. We apprehend that no effectual remedy is obtainable in present circumstances.

The true corrective would be to assign the conservancy of the atmosphere and of rivers to officers directly appointed by and responsible to the crown. To this opinion has come Dr Richardson, one of the most eminent promulgators of the laws of health. In a recent lecture on the subject at the Royal Institution, he says very pointedly: 'In the future of sanitary science, the politician must come forward more resolutely than he has done, in order to secure for those he governs three requisites—pure water, pure food, and pure air. It is utterly hopeless to trust to companies in a matter of such vital importance as the supply of water. It is equally hopeless to trust to the undirected action of local authorities.' Proceeding to state that a remedy can be found only in the official action of a supreme authority, he says: 'As to pure air, there is no practical legislation of any kind. The air of our large towns is charged with smoke and impurity. The air of our great factories is charged with dusts which destroy life

with the precision of a deadly aim. Dr Purdon, one of the certifying surgeons under the Factory Acts, reports that in flax-working factories under his care, the carders, who are all females, if they get a carding-machine at sixteen years, generally die at thirty years. Could anything be more terrible than such a fact, that a girl of sixteen should have to live by an occupation that will bring her existence to an end in fourteen years, and to that end with all the prolonged wasting, sleeplessness, suffering, incident to the disease consumption of the lungs? If it were the fate of these doomed workers that at the close of fourteen years' work the majority of them were taken forth and shot dead in an instant, their fate were infinitely better than it is. The heart of the nation would thus be aroused, and the law in all its majesty would be put in operation to arrest the progress of the crime and to punish the offenders. Yet, year after year as terrible an offence goes on, and because the result of it is hidden in the sick-room, there is no arrest of its progress, no punishment for its commission.'

In the same lecture, Dr Richardson speaks with equal vehemence on the too prevalent practice of polluting rivers and wells by the influx of sewage from large towns and various kinds of public works, dye-works in particular. Here, again, the action of local authorities is generally hopeless. Magistrates and town councils will complacently see a river flowing past them loaded with impurities. 'The government,' he says, 'must either produce a process or processes for pure water supply, and insist on every local authority carrying out the proper method; or it must—and this would be far better—take the whole matter into its own hands, so that under its supreme direction every living centre should, without fail, receive the first necessity of healthy life in the condition fitted for the necessities of all who live. By recent legislation we had some security for obtaining fresh animal food, and foods freed of foreign substances or adulterations. The penalties that might be inflicted on those who sell decomposing, diseased, or adulterated foods were beginning to have effect, and much good was resulting.' Similar regulations ought to be applied to water. The fouling of rivers by sewage must be rendered penal. What horrid ideas arise on the consideration that a large part of the population of London are daily using the water of the Thames, into which has been poured the sewage of Oxford and a number of other places! The Clyde below Glasgow offers an example of still greater pollution; but its very badness saves it from use for domestic purposes; and in point of fact this fine river, for the improved navigation of which so much has been done, can now scarcely be spoken of as anything else than a gigantic common sewer, on which ships of large burden are borne to and from the sea. The Irwell at Manchester offers a specimen of an impure river of a different type. Here much of the pollution seems to arise from the liquid refuse of dye and other works. The last time we saw the Irwell, it

had all the appearance of a sluggish river of black ink. Its colour, however, is liable to change with the predominating dye-stuffs which it happens to receive. The droll remark is made, that boys who indiscreetly take a fancy for bathing in it are apt to come out blue. Its condition and qualities were some time ago commemorated in a few comic verses in a newspaper, of which a cutting was sent to us. We give them as being too clever to be lost sight of.

SONG OF THE IRWELL.

'I flow by tainted, noisome spots,
A dark and deadly river;
Foul gases my forget-me-nots,
Which haunt the air for ever.
I grow, I glide, I slip, I slide,
I mock your poor endeavour;
For men may write, and men may talk,
But I reek on for ever.

I reek with all my might and main,
Of plague and death the brewer;
With here and there a nasty drain,
And here and there a sewer.
By fetid bank, impure and rank,
I swirl, a loathsome river;
For men may write, and men may talk,
But I'll reek on for ever.

I grew, I glode, I slipped, I slode,
My pride I left behind me;
I left it in my pure abode --
Now take me as you find me.
For black as ink, from many a sink,
I roll a poisonous river;
And men may write, and men may talk,
But I'll reek on for ever.

And thus my vengeance, still I seek
Foul drain, and not a river;
My breath is strong, though I am weak,
Death floats on me for ever.
You still may fight, or may unite
To use your joint endeavour;
But I'll be "boss," in spite of Cross,
And poison you for ever.'

We trust that the concluding threat of remaining for ever a poisonous and fetid river is not true of the Irwell any more than the Thames or the Clyde. The subject of river-pollution, as of air-pollution, is too serious to be much longer neglected, and we trust that government, setting aside private, selfish, and factious interests, will soon deal with it in as peremptory a fashion as constitutional forms will admit. As concerns the pollution of the air by smoke from factories, there is not a vestige of excuse. We have shewn again and again with, we fear, tiresome reiteration, that the consumption of smoke is a very simple mechanical process, and has the advantage not only of keeping the air unpolluted, but is attended with such a considerable saving of fuel, as to render the first cost of the appliances of no consequence. If such be the case, and we can prove it by many years' experience, the proprietors of public works at the seaside resort already mentioned, and hundreds of

other factory owners, are clearly chargeable with a shameful degree of disregard to the rights and feelings of their fellow-creatures. W. C.

THE LAST OF THE HADDONS.

CHAPTER XXXVII.—REST AND PEACE.

TIME has run on since then, and my life has grown fuller and happier. It was a great disappointment to Philip and Lilian to find what my boasted good fortune really was; and nothing would reconcile them to the idea of my remaining at the Home, although they were not able to deny that the work there was congenial to me.

Marian Trafford never forgave me my one day's grandeur, and never again addressed me as an equal when we chanced to meet. She and her husband did not lead the happiest of wedded lives. On the evening of Lilian's wedding-day, Arthur Trafford was found lying on the floor of his dressing-room with an exploded pistol by his side. If he really meant to destroy himself, he had attempted it in the half-hearted way with which he did everything, having only grazed his temples and swooned with fright, and so offended his wife to no purpose. Poor Marian, her married life was neither a long one nor a happy one! No child's voice was heard at Fairview; and the miserable bickerings between the husband and wife were common gossip. She was not the kind of woman to try to conceal her disappointment; and he was not the kind of man to spare her the knowledge that she had never possessed his love. Could he have foreseen, he would doubtless have adopted a different policy, and at anyrate kept up some semblance of affection.

A neglected cold and improper clothing for the season brought on an attack of inflammation of the lungs, to which Marian succumbed; and after her death it was found that she had avenged herself. A lawyer was hastily summoned to her bedside, and her will made as soon as her illness was pronounced dangerous. After the funeral it was found that the endeavours of Arthur and his sister to make up for the past by extra attention at the last had been in vain. It was said that she talked to them about the large fortune which they would inherit up to almost the last hour; and their disappointment was bitter in proportion.

All Marian Trafford's wealth was left to Lilian's children. Not to Lilian, as she in a characteristic letter informed her—'In case your husband should die, and Arthur should get the property after all, for he would be sure to marry you directly. Many and many a time has he taunted me about his love for you; and as good as said I wasn't to be compared! But if he married me for the sake of my money, he won't have much to boast of now. His sister too, Caroline, will be in a fine state; but she's only got herself to thank for what I have done. I *did* mean to leave something handsome to Caroline, till I overheard her talking to her brother about me begging him to have patience a little while longer, because the doctors said that I could not last out many days unless a turn came; and saying ever such things about what she had had to put up with! What she had to put up with, indeed! When she has had such a home at Fairview, and lived upon the best of everything, without its costing her a penny!

And as to presents ; no one could be more generous than I have been to Caroline ; and she knows it, if she would only speak the truth. If I do not get over it, I am determined that *they* shan't be any the better off ! I'd sooner leave everything to Miss Haddon, though I should be loath to do that too. Fortunately, there is you, dear ; you are my sister after all, and your Ma was not treated well ; I have always said that. Besides, I can't forget how kind you were to me, when you thought that it was *my* Ma who went wrong instead of yours. You never shewed off a bit ; and it's only right you should be rewarded. I haven't put Aunt Pratt into my will, because one naturally does not care about its being known that any of one's relations are common people ; but I should like you to give something handsome to her, and say it came from me ;' and so forth, and so forth ; a letter we were all only too glad to put out of sight and out of mind as soon as possible.

The Pratts were well taken care of, and not a little astonished at Marian's liberality, as it was interpreted to them by Lillian. Arthur Trafford made a great deal of protestation in the outset about his repugnance to receiving the annuity which Philip offered ; but of course he *did* receive it, and in time came to think that it was much less than he ought to have, always forestalling it. But Philip remained firm, and never increased the amount to more than was at first offered, a sum which he considered sufficient for an idle man to live upon.

How shall I write of the married life of Philip and Lillian ? I will only say with the poet :

Love took up the glass of Time, and turned it in his glowing hands ;
Every moment lightly shaken ran itself in golden sands.

They were not selfish in their happiness, finding plenty of room in their hearts for those outside their own circle ; which by the way was now a not very small one. Need I say they held fast to 'Sister Mary ;' and though they could not be brought to allow that she had chosen the life she was best fitted for, they did their best to impart to it as much sunshine as they could ; and I hope comforted themselves with the belief that my happiness was owing more to their efforts than my work. Was there a word of truth spoken in the jest, sometimes thrown playfully at me, to the effect that I was imbuing my god-child Mary with the notion that she had a mission, as her brothers term it ? She was a thoughtful earnest child of fifteen, who had spent a great deal of her time with me, and sometimes said she would choose Aunt Mary's life before all others. It did her no harm to think so for the time being ; but I knew that Aunt Mary would choose her mission to be a happy wife and mother. Failing that, I could only hope she would be as happy as Aunt Mary. For notwithstanding an occasional bit of sentiment, I was as happy a woman as could be found in the three kingdoms, with a larger circle of friends than I could well count. And very proud I was of their friendship, though the majority of them could not be said to belong to the upper strata of society. I had a large correspondence too—letters which brought tears of joy and thankfulness to my eyes, though they could not be quoted

as elegant specimens of the art of letter-writing ; to say nothing of their being addressed in a somewhat eccentric manner, occasionally sealed with a thimble, and so forth.

I imagined that the story of my life would run thus smoothly and evenly on to the end ; but the aspect of things changed. First, we lost dear old Mrs Tipper, who passed peacefully away, lovingly tended in her last moments by her children, as she called us. She left everything she possessed to me. Shortly afterwards, Jane Osborne died, bequeathing the bulk of her property for the future maintenance of the Home, and what she termed a competence to me. Five hundred a year appeared to me something more than a competence ; and with my dear old friend's legacy it made me a rich woman.

Philip and Lillian would now give me no peace, insisting that I had not the shadow of an excuse for remaining at the Home. Moreover, Hill Side was waiting for me. They had been long engaged in altering and improving Fairview, and had at length taken up their abode there. It was now a large estate, sufficient ground adjoining having been purchased to make a good park ; and the trees, planted fifteen years before, were beginning to look respectable. The house itself has been a great deal altered and *subdued*, as Philip calls it, a story being taken away, and wings thrown out, &c. ; very greatly to its improvement. It now looks a fitting home for a family of good standing, and as Philip's brother allows, a residence worthy of one who owns the name of Dallas.

In truth they had outgrown Hill Side ; two spirited boys and three girls with the necessary arrangements for an education befitting their accumulating wealth, were not contemplated in the first plans ; and I could not pretend to think that the change had been made solely on my account ; although they threatened to let the place fall to ruin, if I would not go to it. Everything was left just as it was ; Lillian took nothing but her mother's portrait, and Philip a portion only of his books ; and to this also there was no demurring ; Fairview being furnished befitting its size. Whilst I was still hesitating, or fancied that I was hesitating (for I found it very pleasant to dwell upon the idea of ending my days at Hill Side), Robert Wentworth put in an irresistible argument in favour of my yielding to their wishes, and quitting the Home. He pointed out that I was preventing some poor gentlewoman from earning the income pertaining to the situation. I was not a little surprised at his going over to their side ; but I could not, had I wished to do so, deny the reasonableness of his argument. As soon, therefore, as a lady was found to undertake the office, I resigned it.

My home-coming was made a fête-day in the village. Had a royal visitor been expected, more could not have been done in the way of preparation. The place was gay with flags and evergreens, whilst feasting and bell-ringing were going on all day. And the approach to my future home was arched over with flowers, and 'WELCOME' repeated wherever the word could be put, but expressed more delightfully than all in the faces of Philip, Lillian, and their children. It was a busy day too, as 'befitted the coming home of Aunt Mary,' laughingly said the children. A dinner was given to the grown-up people in a large tent on

the green ; and later on a tea, to which children were invited, with a day's holiday to all and sports between times. Of course Becky and her husband were honoured guests with their eight children. He is now a flourishing market-gardener, very proud of his little woman, though her happy married life does not tend to decrease the size of her mouth, since there is always a smile upon her face.

We had all been very busy, and were glad to take our tea on the terrace in the cool of the evening—just sufficiently distant from the sound of merriment in the village below. After tea, Philip and Lilian, lovers still, stroll down to the green to watch the sports awhile, the tired children electing to remain with Aunt Mary and Uncle Robert. My eyes followed the two as they passed down the path under the flowery arches, husband and wife in all the best sense of the words. Philip was a stately, thoughtful, English gentleman, growing anxious and ambitious for his two boys ; a little too ambitious, I told him, in certain directions, since they are but mortal. And his happy wife, beautiful 'with all the soul's expansion,' was worthy to be the mother of girls—confiding to me *her* ambition to fit them to influence the lives of honourable men.

My nieces, as they were called, were to live with me in turn. Lilian says they are very pitiful to such of their friends as have no Aunt Mary. Little Phil was very enthusiastically describing to me the advantages of my new home.

'Look here, Aunt Mary ; it's the best place for larks you can imagine ; beats Fairview hollow.'

'Larks, Phil ?'

'Well, you know. Suppose you've got some one in the library you want to make jump nearly out of his skin ; just creep round the plantations, and crawl under the bushes, and climb up over the stones—you must take care though, for they are awfully slippery—and peep in at the windows with your face made up like a brigand, and point a sham pistol at him !'

I expressed a doubt as to my capacity for crawling under bushes and climbing over slippery stones ; at which Phil proposed other larks, which he considered to be more within the compass of my ability. But with the dignity of thirteen, and the experience of three months at Eton, Robert gave it as his opinion that Phil's larks were not worthy of the name.

'Look here : I know a fellow ;' &c. &c. ; sinking his voice into a whisper as the two boys drew closer together ; their sister Jenny, who is said to be developing a taste for larks, and is very proud of being occasionally taken into their confidence, listening with bated breath and dilating eyes. Then Mary whispers to me that if I want to enjoy that bit out of *Midsummer Night's Dream*, and fancy myself in the woods *really*, I must sit under the tree on the slope when the moon is rising and the shadows are deep. And before she is carried off by her nurse, Baby Lily solemnly presents me with a woollen lamb, which she thinks enough to insure my future happiness and make me 'dood.'

'And so you have got your rest and peace at last ?' said Robert Wentworth, as he and I stood for a few moments together on the terrace watching the sunset.

'Yes,' I replied, a little absently, my thoughts reverting to the old dreams of peace and rest.

'Well, it's all *couleur de rose* now. But how long will this kind of thing satisfy you ?'

'What kind of thing ?'

'Being worshipped and fêted in this way.'

'I find it very pleasant,' I demurely replied.

'You will not for long, Mary.'

'Do you think I am not capable of appreciating rest and peace then ?'

He smiled. 'I give you six months.'

'And yet you were as urgent as the rest about my giving up work,' I said.

'Yes ; I wanted to see you in an independent position, and so to ascertain if certain theories of mine are correct.'

'Uncle Robert, is it true ? Phil says he heard mamma tell papa that she did not despair of your marrying Aunt Mary even now. Is it true—*really* ?'

I saw a swift flush pass over his face, and an expression in his eyes which I had only once seen there before, as they turned for a moment upon me. Then after a few moments he said, in a low husky voice : 'Ask auntie !'

Robert Wentworth had never married, and I cannot affect to be ignorant of the cause ; but in all the long years that have passed he has spoken no word of love to me. Now the child's words had stirred the depths of his nature, and shewn me that time has worked no change in him.

'Is it true, auntie—is it ?' asked Jenny, turning impetuously towards me.

'Uncle Robert and I love each other like old friends, dearie,' I said, replying to *him* in a low faltering voice. 'But—I am too old to think of—marrying ;' laying my hand gently upon his, resting upon the back of a garden-seat, as I spoke.

'Well, that's what Robert and I said,' frankly ejaculated Jenny. 'You *are* old, and old people don't marry ;' and off she ran to tell the others.

He recovered first, beginning to talk to me about a case he had in hand, and very soon contriving to get me sufficiently interested in it to enter warmly into the pros and cons with him. He was no longer a briefless barrister, having made a name in the profession, and being remunerated accordingly. I have the comfort of knowing that his life, like my own, is on the whole a full and happy one, although we have both had to bid adieu to certain things.

Before the six months he had given me expired, I began to find that I required change of air, and commenced absenting myself occasionally from my beautiful luxurious home for two or three weeks at a time and sometimes even longer, much to the surprise of Philip and Lilian, who could not understand why I should choose to go alone and be so mysterious about the places I visited. But they became less anxious if not less curious when they found that I always returned cheered and refreshed by the change, and at length ceased to question me.

Robert Wentworth appeared to take it for granted that my trips were in search of the picturesque ; occasionally remarking that I must be growing familiar with all the loveliest nooks in England. I flattered myself that I had for once succeeded in keeping him in the dark, and he did not suspect the real object of my journeys. But I was mistaken. I might as well have taken him into my confidence at once, and he shewed me that I might, in his own fashion.

During one of my absences from Hill Side, I was under the unpleasant necessity of appearing

at a police court. In obedience to a call for Mary Jones, I stepped into the witness-box, as unwilling a witness as had ever made her appearance there. I had just been trying to comfort myself with the reflection that Robert did not take up such cases, and was not at all likely to be there, when our eyes met; and from the amused expression in his, I knew that he was about to examine me, and something of what I might expect. As he afterwards informed me, he had taken up the case for the express purpose of shewing me that he knew all about my movements.

'Is Mary Jones your real name?'

'It is the name I am known by.'

'And you are a lodger in Biggs Court, Bethnal Green?'

'Yes; I have two rooms there.'

'And go out nursing sick people in the neighbourhood?'

'I have occasionally done so.'

'Is it a fact that you have musical evenings and readings to which you invite the poor women in the neighbourhood; and that you lend money to the deserving, and give lectures to them about the management of their homes and children?'

'I do not call them lectures, sir,' I replied demurely. 'But I see that you know all about my movements.'

'It is my business to know,' he replied gravely, going on with the case, a charge of assault, not uncommon in the neighbourhood of my town residence, to which I had been a witness, and was obliged to give evidence.

Since then we have not met very frequently. He is always an honoured guest at Fairview; but he is on the Bench now, devoted to the grand earnest life of the upright judge, and has very little time for private intercourse, although he is always ready to give us counsel and advice. It is my pride to hear of the respect and honour he wins, and to know that I have not been instrumental in impairing his usefulness in the world. Meantime, we are beginning to talk sometimes of the life beyond, with the yearning of those who have borne the heat and burden of the day, and I listen with bowed head and thankful heart to his acknowledgment that his life has not been lived in vain for himself any more than for others. This may be said only to cheer and comfort me; but I believe that it is truer than he himself thinks it to be. But I am above all pleased with his occasional grim little attacks upon my logic, &c., for that is to me the most convincing proof that we are the best of friends; and we are highly amused when the children take my part, and ask him not to be hard upon Aunt Mary.

THE END.

HYDERABAD AND ITS RULERS.

THE dominions of the Nizam, of which Hyderabad is the capital, are situated in the southern part of Central India, and are of considerable extent—nearly five hundred miles from north-east to south-west, and about three hundred and fifty in breadth. The Nizam holds a very high place among the native sovereigns of India; his revenue is a large one, and is yearly increasing, greatly owing to the wise administration of the present prime-minister, Sir Salar Jung, a man of singularly intelligent

and enlightened views, with a remarkable capacity for government. For upwards of twenty years this able and talented man has powerfully swayed the councils of the Nizams; and since the death of the last ruler, his young son and successor, still a minor, has been entirely under his guidance and control.

The young Nizam is now a boy of nine or ten years of age; and until he is fifteen he will not assume the reins of government. His health is unfortunately not good; his constitution being naturally a feeble one, and the enervating life led in the zenana has in no way tended to strengthen it. He is said to have an amiable disposition and not bad abilities; an English tutor has been provided for him, and he has every facility for receiving a first-class education. This, in conjunction with the wise counsels of his prime-minister, ought to make him a liberal and enlightened ruler when the time comes for him to take the authority into his own hands. Let us trust that it will be so.

Sir Salar Jung speaks English fluently; and on the not rare occasions when he gives an entertainment to the élite of the European society, his manners are those of a polished and high-bred gentleman, anxious that his guests should enjoy themselves, and that none should be overlooked. In his extensive and splendidly furnished palace are several rooms fitted up entirely in the English style, with chairs and sofas of every form and dimension, and tables covered with albums, photographs, and all the innumerable ornaments and knick-knacks of fashionable London drawing-rooms. Here the guests all assemble before dinner; and when the announcement is made, Sir Salar offers his arm to the principal lady present, generally the wife of the English Resident, and conducts her to the dining-room, his own private band playing *The Roast Beef of Old England*, while the company defile into their places. Here, again, all is in the English style, or rather in that which is known as *à la Russe*: a long table brilliantly lighted, and decorated with flowers, fruit, and confectionery, all arranged in the most tasteful manner, the band continuing to play at intervals. The dinner is in precisely the same European fashion—one course following the other; and the viands and wine all of the most *recherché* description; champagne in abundance, liqueurs, everything in short that can gratify the most fastidious palate; Sir Salar himself being a man of the simplest tastes and drinking nothing but cold water.

Dinner ended, all rise, the gentlemen not remaining behind the ladies. Sir Salar again conducts the *burra bebee*, or principal lady, to a terrace on the roof of the palace, where there are seats arranged for the guests, tea and coffee handed round, a quiet cigar permitted in the background, and where a fine exhibition of fireworks is witnessed. This is the conclusion of a very agreeable entertainment, to which about a couple of hundred people are usually invited, who are all received with the most perfect courtesy by Sir Salar, his young sons, and the members of his suite; and who quit his hospitable roof much

impressed by the large-mindedness and frank geniality that so greatly distinguish the Nizam's popular prime-minister.

Sometimes while the company is arriving, a 'nautch' is held in a kind of garden quadrangle, and the guests stroll out and look on for a few minutes, just as they feel inclined. Ordinary nautch-dancing is anything but the incorrect proceeding it is commonly supposed to be; it is really rather a dreary entertainment, and a very few minutes of it will be sufficient to satisfy the curiosity of most people. Be this as it may, nautch-dancing is a very favourite amusement among the high-class natives. When Sir Salar Jung gives a banquet to his fellow-countrymen, there is a nautch on a very large scale; the viands also differ considerably from those presented to his European guests, and consist chiefly of curries of every possible kind and flavour, sometimes more than fifty being served at a meal.

Though he has held the supreme power for many years, and has been prominently before the public for a yet longer time, the prime-minister of the Nizam is not much above forty years of age. He is of medium height, with an air of great dignity, an intelligent expression, and piercing dark eyes. His face is entirely shaven except a dark moustache; he generally wears a tight-fitting dark robe and small white turban, with the Star of India on his breast, and well-fitting English boots. His two wives and his daughters are never seen out of the zenana, but they receive visits from English ladies; and it is generally understood that Sir Salar is more liberal in his ideas regarding the treatment of women than is usual among Mussulmans; and his daughters are well educated, and have had foreign instructresses.

Among the institutions of Hyderabad evidencing an enlightened spirit both among the foreign residents and the natives, is the successful establishment of an American female doctor, a lady distinguished alike by professional skill and charm of manner, and who commands an excellent practice among the female portion of the community. She is also frequently summoned to attend at the zenanas, a very great boon to the poor secluded inmates, whose maladies are very frequently wrongly treated, owing to the imperative strictness of the rule which prohibits the physician from ever seeing his patient; the most that is allowed in the case of a male practitioner being the extension of the hand or tongue through a slit in a curtain, the face all the time remaining perfectly invisible.

Hyderabad, with which is closely connected the large Anglo-Indian station of Secunderabad, is in many respects a very pleasant residence. The society is good, for in addition to a considerable sprinkling of civilians, occupied in various ways, Secunderabad is an important military centre, and the district enjoys many advantages in a social and sanitary point of view. Only about twenty-four hours' journey from Bombay by rail, it is thus brought into easy communication with one of the great mercantile and social centres of India. Its real distance from Madras is not much more; but as there is no direct line, a detour has to be made in order to join the main line from Bombay at Sholapore, which nearly doubles the time consumed in travelling between the two places. This, however, may probably be amended by-and-by;

when Madras will be about equidistant with Bombay, and Hyderabad will then rise into even greater importance. The climate is, generally speaking, excellent: its situation, nearly two thousand feet above the level of the sea, conducing much to its salubrity; while it is fortunate in having two monsoons or rainy seasons, one between June and September, and a shorter one later in the year. These rains are not of the ordinary violent character, but more resemble April showers; the entire depth of fall not usually averaging beyond twenty inches, while it is more genially and beneficially diffused, rendering the air delightfully cool and pleasant.

The cost of living is perhaps rather under the recognised rate of most Anglo-Indian stations. Certain things are to be had very reasonably indeed, while others are high-priced, especially the generality of European articles, which are charged nearly double what they would fetch at home. Strangely enough, tea is very dear; nothing drinkable can be got under about six shillings a pound; lower-priced kinds being perfect trash. But eggs, poultry, and even very tolerable mutton can be bought very cheaply; a rupee (about two shillings of our money) will purchase three or four fowls, certainly rather skinny ones; while three rupees is an ordinary price for one of the small country sheep, and the mutton is not bad, though of course it is not 'gram-fed,' as they call the kind specially fattened for the table, and which costs three or four times the money. There is much sociability among the English residents; and the cooler nature of the climate enables them to have a greater variety of al-fresco entertainments than is customary in the tropical temperature of most parts of India. Perhaps partly in consequence of this, combined with its higher and more salubrious situation, the district round Hyderabad is generally very healthy; and people have lived there for many years and enjoyed excellent health without ever coming home at all. One well-known old Scotch gentleman has resided chiefly there for fifty years without ever returning to his native country; and to judge from his active habits and hale appearance, he will live there for many years to come.

Among the native population, however, the repulsive disease of leprosy is very prevalent; but Europeans seldom or never suffer from it. This dreadful malady is of two kinds: in one the type is exceedingly malignant; the afflicted persons are not permitted to go abroad, but are secluded in buildings specially set aside for their reception, and to all intents and purposes they are dead to their fellow-men.

The supply of water in the locality is excellent, mainly owing to the enormous reservoirs that have been constructed in the vicinity of Hyderabad, used principally for bathing both by the natives and by Europeans. The largest of these is about twenty miles round; and they are reached by numerous flights of steps, which are generally thronged by the natives at all hours of the day, for the double purposes of ablution and washing their clothes.

Cotton is the staple production of the country; but its other products and resources are being rapidly developed by Sir Salar Jung, who has organised large public works of various kinds, and is opening new roads through the less frequented portions of the Nizam's territory. If he could be

induced to impose more taxes, a very great, and also a justifiable increase of the revenue could be easily effected; but to this measure he has an invincible objection, alleging that it is a system to which the subjects of the Nizam have been little accustomed, and which would be unpalatable to all classes alike. This may be true; but so enlightened a ruler will probably ere long be brought to acknowledge the necessity for a moderate adoption of this system, both in the interests of his master and in those of the real prosperity of the noble dominions he has so long and so faithfully governed.

'PRENTICE-LIFE AT SEA.

THE sea is one of the most beautiful objects in nature, whether we watch it breaking in playful ripples on the pebbly beach, or shrink from it aghast when it rushes along the shore in the full thunder of its wrath, seething, tortured, convulsed, struggling in the clutch of the storm-fiend. To us in England who owe it so much, to us who have for centuries reaped our harvests on its pathless plains, and made of its trackless billows a highway to fame and fortune, the sea has always been an object of intense, almost passionate interest. Hence there have never been wanting among us volunteers for the wild sea-life of freedom and adventure. The boy intended by fond parents for quite a different fate, dreams of the unknown sea as he creeps reluctant to and from school, devouring it may be the while some well-thumbed novel of Marryat's, instead of mastering the intricacies of a Latin verb; until at last, the passion growing with his growth, he leaves all else behind him and finds his way to the shore, and looks wonderingly at the great ships lying in the harbour. Blissful Edens these, which have fought many a battle with the mighty ocean, although they are lying now so quietly in dock, with their rigging stretching aloft like a network of twine, and piles of cable lazily laid up on deck like so many coiled snakes. Gradually he finds his way on board, and then discovers that the rose has thorns; that sea-life, in other words, is by no means an Elysium.

Such a career is sketched for us in an amusing book, *Two Years Aboard the Mast*, by F. W. H. Symondson. The author was an apprentice on board the *Sea Queen*, a sailing ship, bound for Sydney with a general cargo. The ship was a good one, registered A1 at Lloyd's, and carried a crew of twelve able-bodied seamen, four ordinary seamen, and three apprentices besides himself. There were also three mates—the first, second, and third.

Naturally life at sea is made up very much of routine, and the routine on board the *Sea Queen* was after the following fashion. A sea-day commences at mid-day, when we must suppose the starboard watch, to which our apprentice belonged, to be below. At twelve o'clock (eight bells) he comes up along with his watch, to relieve the port watch, who then have dinner. The second mate, who has charge of the starboard watch, then sees that every one goes to his proper work. He gives an eye to the steering of the ship, and carefully notes any shifting of the wind. A fresh helmsman relieves the man at the wheel, and receives direc-

tions as to steering from him; and our apprentice being the youngest, looks after the time and strikes the bells. At half-past twelve he strikes one bell, at one o'clock two bells, and so on. At four o'clock, eight bells are struck, and the port watch is called; and as soon as the man at the wheel is relieved, the starboard watch go below, and smoke or read or spin yarns until tea-time, which is at five o'clock. They then receive a pint of the pale inky coloured nectar which does duty for tea on board ship, and along with it salt pork or junk. This is cooked in different ways; chopped up with biscuit, water, and slush, by which is meant the grease from salt meat, it forms a sea-delicacy called scone. Another *bonne bouche* is dandy-funk, which is compounded of powdered biscuit, molasses, water, and slush; while dogsbody, composed of pea-soup, powdered biscuit, and slush, is also considered to form a savoury and refreshing compound. At six o'clock the other watch come below, and have their tea. During the first dog-watch, from four to six, no regular work is done, but no larking is allowed; but the second watch, from six to eight, is given up to fun and frolic of the maddest and merriest description, such as chasing rats with belaying-pins, or trying to turn the cook out of his galley, while he defends himself with boiling water. At eight o'clock the wild scrimmage ceases as if by magic, the starboard watch turn into their berths, and nothing is heard but the measured tread of the look-out on the fore-castle head, and the soft murmur of the wind and sea, as the night-breeze fills the sails, and the *Sea Queen* glides onward to her destination through the rippling water.

At midnight the port watch is relieved, all hands muster on deck, and the mate in charge sings out: 'Relieve the look-out! Relieve the man at the wheel!' and then all is silent again until four o'clock, when the starboard watch go below, and the port watch come up.

The cook is called at four; and from half-past five to six the men have their coffee, and then comes the order: 'Brooms and buckets aft, to wash the decks;' which shews that the work of the day has begun. While the decks are being scrubbed, the captain generally makes his appearance, and after inspecting the compass and the sails, sits down in his favourite arm-chair on the poop with a book. On Saturday afternoons each watch are allowed an hour to wash their clothes, and at half-past four or five the stores for the week are served out: these consist of articles such as sugar, vinegar, &c.

In the little world of the ship, the captain is an irresponsible autocrat; his word is law; to refuse to obey him is mutiny. The sole command of the navigation and working of the ship rests with him, and the weather-side of the poop is his private property when he chooses to come on deck. In the ordinary daily work he seldom interferes personally, but transmits all his orders through the chief mate, who is a very important officer, and who superintends everything. When the cargo is stowed, he must give an acknowledgment for it and for all goods in the hold, and must make up any deficiencies. He must also keep the log-book, which is a very important trust. The officer of each watch marks upon the log-slate the courses, the distance run, the winds, and any subject of interest; and these at the end of every twenty-four hours are copied into the official log-book by the chief mate. The duties of the second

and third mate are less onerous; but they must always be addressed by the prefix of 'Mr' and answered with 'Sir.' The third mate has to dispense the stores—a very unpopular office, and one which does not fail to call down a shower of anything but blessings upon his devoted head. A boatswain is in general only carried by large ships, and his sole duty is to look after the rigging and all that concerns it. The carpenter is both an important and independent personage on board ship; the captain alone gives him his orders, and he has nothing to do with any of the three mates; his usual sobriquet is 'Chips.' The steward is in point of fact the captain's servant, and although he is well paid, he is generally looked down upon by the crew, who call him 'Flunkey.'

Pursuing the narrative presented to us by the *Sea Queen's* apprentice, we find that the cook, if he is a good one, is a very important personage on board ship; he answers generally to the name of 'Slushy' or 'the Doctor,' and requires to be, and indeed almost always is, an individual of some resource, for he practises his calling amid difficulties such as would utterly dismay a *chef de cuisine* on land. His kitchen, to begin with, is such a mite of a place that the wonder is that he can fry, roast, or boil anything in it; then it is provokingly subject to sudden inundations, partial deluges which come tumbling in as if in sport, playfully extinguishing his stove, and sending his provisions, cooking utensils, and seasonings sliding and spinning all around him; while if he is worth his salt he will still, in spite of all these difficulties, turn out such a meal for the cabin table as Soyer under the circumstances need not have blushed to own. As is befitting in the case of such a superior being, he has certain social advantages; he can smoke in his galley whenever he chooses; and he slumbers peacefully all night in the best bunk of the fore-castle, blissfully unconscious of the existence or claims of port or star-board watches. The apprentices are not so well off, although a premium of from thirty to sixty guineas is sometimes paid for their term of four years; the only advantage they have is living apart from the crew. Their duties are the same as those of a fore-castle boy, and they share the same food, which is sufficient in quantity, but often very bad as to quality.

On the 9th March the first Australian sea-birds were sighted; and on the morning of the 16th they cast anchor in Sydney Harbour, which, with its wooded hills sloping gently down to the sea, seemed to our apprentice a perfect paradise of beauty. At Sydney they remained a fortnight, enjoying the luxury of very good and very cheap dinners, for meat only cost from twopence to fourpence per pound. After discharging their cargo, they sailed to Newcastle, sixty miles distant, to take in a cargo of coal, with which they sailed on the 23d April for Hong-kong, where they arrived on the 15th of June.

While at Hong-kong they had abundance of buffalo-meat, eggs, fruit, and soft bread, and plenty of hard work too, in washing out the hold of the ship, which had been much begrimed by the coals, to fit it for a cargo of tea. This the captain was unable to obtain, and was in consequence obliged to sail to Foo-chow, on the river Min, where, on the 12th of July, they arrived at Pagoda anchorage, so called from an old pagoda built on an

island in the river, which widens out here to the dimensions of a small lake. Here also they waited in vain for a freight of tea, and the captain at last resolved to take a native cargo of poles to Shanghai, and try for better luck there.

On the 14th September they entered the Yang-tze-kiang, where they found the scenery flat and uninteresting, but yet home-like, for the river reminded them of the Thames below London.

In the course of a week they unloaded their timber, but still no freight of tea could be procured; and the captain, after some delay, resolved to return to Foo-chow, taking as ballast native goods and medicines, two dozen sheep, and two dozen passengers. On the voyage back to Foo-chow, the cook having abandoned his post in disgust at the sharpness of a new Chinese steward, our apprentice was induced to volunteer his services, and was formally installed in his new office at four o'clock one fine morning. He began his arduous task by trying to kindle a fire, which for more than an hour obstinately resisted all his efforts to make it burn. At last he succeeded in evoking a tiny blaze, and thankful at heart even for that small mercy, he placed upon his fire the copper with water for the breakfast coffee, and marched off elate to get the rations for the day. It chanced to be a pork and pea-soup day; and having got his supplies of pork and pease, he returned to his galley, and was horror-struck to find that the sea was washing into it every few minutes, sometimes sportively rising almost as high as the precious fire which had cost him so much trouble. In his anxiety to preserve this cherished flame, the little tub of pork, which he had put out of his hands for a moment, capsized, and its contents were washed swiftly round and round the galley, to the surprise and disgust of the unfortunate amateur. At last, giving chase, he succeeded in capturing them with a considerable admixture of cinders; and having placed the tub and its heterogeneous contents out of harm's way, he concentrated his energies upon the question of the moment, which was coffee.

Tired of waiting for the water to boil, he threw in the coffee, and then, to while away the time, he began to pare some potatoes, which, by some unaccountable fatality, as fast as they were pared rolled out of the basin in which he placed them, upon the floor. Whish! away went the ship, lurching heavily, and away went the tub of pork again; and pork, tub, and potatoes began chasing each other round the galley in gallant style, being kept in countenance by a couple of 'buckets,' which went frantically clanging and clanking against each other and everything else that came in their way. Despair shews itself in many ways: at this crisis our apprentice laughed; and he was still grinning over his own mishaps, when the watch arrived, sharp set for their coffee.

They were by no means in a laughing humour when they learned how the land lay, and neither was he, for that matter, when they left him. Convinced that at all risks he must make the water boil, he frantically heaped upon the fire odd bits of rope and canvas; but the water had a will of its own, and boil it would not. Eight o'clock struck, and again they came, each holding out an empty hook-pot, which he filled with by no means the best grace in the world, trying, as he ladled out the vile mixture, to sink the coffee, which floated

like dust upon the surface. It would not do. First one man came growling back, and then another, and then the steward arrived to ask after the captain's potatoes. The captain's potatoes! He had forgotten all about them, and they had meanwhile been having a rare lark of it on deck, rattling first into one hole and then into another, until at last the greater number of them had scuttled overboard. What had he done? Had he been guilty of mutiny, insubordination, or gross carelessness as bad as either, on the high seas? In his panic he stepped back into the galley, which, for a wonder, happened to be free from water, and a hot coal falling out of the stove, burned his foot; and so ingloriously ended his career as cook.

At Pagoda Island the captain became seriously ill; and notwithstanding the most careful nursing on the part of his wife and our sailor apprentice, he passed away without ever having recovered consciousness, and was interred in the English cemetery at Foo-chow.

On the 6th November, the *Sea Queen* having loaded up, and being ready to start, a new captain came on board, the crew standing by the break of the fore-castle and keenly eyeing him as he stepped on deck. There was not much to look at in him. He was a middle-sized man, with a moustache and whiskers of a sandy red hue; and that he did not despise his creature-comforts was evident from the quantity of provisions that came on board next day. He was, however, not illiberal with his good things, but from time to time presented the apprentices' mess with some little delicacies. As for the question of questions always asked by a crew with regard to a new captain: 'Does he carry on?' that is, does he risk a large press of sail in a stiff wind, it had to be answered in the negative. He was, in fact, as timid as his predecessor had been, but from a different cause—he had always formerly commanded a steamer, and his new duties were strange to him.

They had now been at sea for several weeks, when one lovely evening our apprentice was with his watch on deck, and had just lain down for an hour's nap, when the after-bell was struck hurriedly three times. As it was his duty to keep the time, and as the three strokes had, moreover, nothing to do with the proper hour, he suspected that something was wrong with the helmsman, a Swede, Edghren Andrews, and was just about to verify his suspicion, when the man rushed up to him and said: 'Will you take the wheel for a minute? I feel very sick; perhaps a swig of cold tea will set me up.' He went to get it; and in a few minutes returned to his post, where he had scarcely been a quarter of an hour, when the bell was again struck twice. A second time he went to the helmsman's assistance, and on the poop met Andrews, who said he was worse than ever; whereupon our apprentice offered to finish up his time for him.

Next morning the Swede took him into the fore-castle and related the following curious story. The evening before, while at the wheel, he had suddenly seen the late captain on the weather-side of the poop, anxiously looking up at the sails and sky; and while he stared at him in mute surprise, he turned round angrily, and looked at him with such a horrible expression of face, that he dropped the wheel in a panic and rang the bell.

In Sweden, he said, ghosts were supposed to have a special dislike to a knife and to the Bible; so he rushed below to procure them, by way of charm; but although he could have got a whole bucketful of knives, he could not lay his hands upon a single Bible; and so, he took instead a Swedish novel, thinking that as the late captain had not understood Swedish, it could not make much difference. He soon found, however, that he had reckoned without his host. He was no sooner set down to the wheel than the ghost reappeared, and approaching the binnacle, looked at the compass, and made angry signs to him to alter the vessel's course. So much for sea superstitions.

On boxing-day the ordinary routine of ship-life was broken by a terrible accident. The port watch had just finished tea, and had turned into their bunks for a smoke and a read, when a frightful clamour and trampling of feet got up overhead. In a moment every one was on deck, where all was in the wildest hurry and confusion. 'A man overboard!' was the cry. 'Who is it? Who is gone?' asked half-a-dozen voices. 'Johnson!' answered the second mate, excitedly hauling at a rope. 'Haul up the mainsail!' shouted the mate, in tones that rung clear and high above the uproar. 'Slack away the sheet, lads! Bear down on the clew garnets.' All was in vain: the sea was so high that the ship could not be brought round to the wind, and the captain would not hear of a boat being launched. 'It would only,' he very justly said, 'put more lives in jeopardy.' With breathless excitement the look-outs at each mast-head strained their eyes into the darkness of the wild night. The black waves were tumbling mountain high, and there, like a cork upon the billows, was their drowning messmate, slowly drifting astern to his doom. A cold shudder ran through the veins of the breathless watchers. Could nothing be done to help him? Nothing! The helmsman threw him a life-buoy as he passed; perhaps he seized it, perhaps he did not: he was never seen again.

On the 26th February they reached New York; and after unloading their tea, took in a cargo of grain and resin, and sailed for London on the 15th of March. It was a bad season of the year, and the ship was overladen with grain, which makes a peculiarly heavy and unelastic cargo. The weather, stormy from the first, grew gradually worse until the 23d of March, when the gale freshened into a tempest, and that again into the wildest conceivable hurricane. Some frightful hours followed; the waves rolled along the bulwarks like mountains of blackish green water; the roar of wind and sea was inconceivably fearful, and suggested to the shivering crew the idea of something demoniac. At last it became evident to all, that unless the sails could be got rid of, the ship would founder. Who was to risk his life in the attempt? What hero would be found to do this deed of courage? As usual the hour brought the man in the person of Jack Andersen, a Swedish sailor. With his open knife between his teeth, this brave fellow sprang along the encumbered deck undaunted by a heavy sea which broke over him; and soon a loud explosion told of his success; the last sail was gone, and the *Sea Queen* lay like a helpless log upon the waters. At three in the morning a lull occurred, and the wind and sea gradually went down; but the vessel continuing

to sink deeper in the water, it was necessary to lighten her, and fifty tons of cargo were thrown overboard. The sacrifice saved her; and on the 1st of April they sighted the welcome Lizard light. As for the suffering and discomfort on board subsequent to the storm, it was simply inconceivable. Our apprentice's chest floated bottom up for days; and his log-book, which was locked up in it, got a thorough soaking, which fortunately did not render it illegible, else we should have missed a very graphic and interesting narrative of life at sea.

'ONLY TRIFLES.'

WHEN tempted to scorn the little duties of our calling, let us think of such sayings as the following. One day a visitor at Michael Angelo's studio remarked to that great artist, who had been describing certain little finishing 'touches' lately given to a statue—'But these are only trifles.' 'It may be so,' replied the sculptor; 'but recollect that trifles make perfection, and perfection is no trifle.' In the same spirit the great painter Poussin accounted for his reputation in these words—'Because I have neglected nothing.' It is related of a Manchester manufacturer, that, on retiring from business, he purchased an estate from a certain nobleman. The arrangement was that he should have the house with all its furniture just as it stood. On taking possession, however, he found that a cabinet which was in the inventory had been removed; and on applying to the former owner about it, the latter said: 'Well, I certainly did order it to be removed; but I hardly thought you would have cared for so trifling a matter in so large a purchase.' 'My lord,' was the reply, 'if I had not all my life attended to trifles, I should not have been able to purchase this estate; and excuse me for saying so, perhaps if your lordship had cared more about trifles, you might not have had occasion to sell it.' 'Oh, what's the good of doing this and that?' we say in reference to departments of our business where quick returns are not forthcoming, or where success does not at once stare us in the face. When Franklin made his discovery of the identity of lightning and electricity, people of this baser sort asked with a sneer 'Of what use is it?' The philosopher's retort was: 'What is the use of a child? It may become a man!' Apropos of this remark, grown-up people should remember while doing improper things in the presence of him who is 'only a child,' that he will one day become a man just like themselves.

Mr Careless Nevermind and Miss Notparticular think that great men only deal with great things. The most brilliant discoverers were of a different opinion. They made their discoveries by observing and interpreting simple facts. When fools were walking in darkness, the eyes of these wise men were in their heads. Galileo's discovery of the pendulum was suggested to his observant eye by a lamp swinging from the ceiling of Pisa Cathedral. A spider's net suspended across the path of Sir Samuel Brown, as he walked one dewy morning in his garden, was the prompter that gave to him the idea of his suspension bridge across the Tweed. So trifling a matter as the sight of seaweed floating past his ship, enabled Columbus to quell the mutiny which arose amongst his sailors at not discovering land, and to assure them that the

eagerly sought New World was not far off. Galvani observed that a frog's leg twitched when placed in contact with different metals, and it was this apparently insignificant fact that led to the invention of the electric telegraph. While a bad observer may 'go through a forest and see no fire-wood,' a true *seer* learns from the smallest things and apparently the most insignificant people. 'Sir,' said Dr Johnson to a fine gentleman just returned from Italy, 'some men will learn more in the Hampstead stage than others in the tour of Europe.' Certainly the power of little things can never be denied by Englishmen who reflect that the chalk cliffs of their island have been built up by little animals—detected only by the help of the microscope—of the same order of creatures that have formed the coral reefs.

Perhaps it is not too much to say that England owes her reputation of being the best workshop in Europe not so much to the fact that she is rich in coal and iron, as because her workmen put or used to put a good finish on their work. A country must become and continue great when its labourers work honestly, paying attention to detail, putting *conscience* into every stone they place and into every nail they drive. There is no fear of England declining so long as it can be said of her workers what was said of the Old Masters in statuary, painting, and cathedral-building:

In the elder days of art,
Builders wrought with greatest care
Each minute and unseen part,
For the gods are everywhere.

How much of this honest workmanship, that careth for little things and not merely for the large and showy, is to be seen on the roof of Milan Cathedral! Here the smallest and least visible statue of the statue forest that tops the building, is carved with quite as great care as the largest and most conspicuous.

It has been remarked that we cannot change even a particle of sand on the sea-shore to a different place without changing at the same time the balance of the globe. The earth's centre of gravity will be altered by the action, in an infinitely small degree no doubt, but still altered; and upon this will ensue climatic change which may influence people's temperaments and actions. Of course this is an absurd refinement; but it illustrates the undoubted fact that the most trivial thought and act in our lives carries with it a train of consequences, the end of which we may never guess. The veriest trifles become of importance in influencing our own or other people's lives and characters. One look may marry us. Our profession may be settled for us by the most trivial circumstance. 'A kiss from my mother,' said West, 'made me a painter.' Going into an inn for refreshment, Dr Guthrie saw a picture of John Pounds the cobbler of Portsmouth teaching poor ragged children that had been left by ministers, ladies, and gentlemen to go to ruin on the streets. The sight of this picture hanging over the chimney-piece on that day, made Dr Guthrie the founder of ragged schools.

On a clock in one of the Oxford colleges is inscribed this solemn warning to those who fancy that killing time is not murder: *Periunt et impunitur* (the hours perish and are laid to our charge). But is not this equally true of those 'odd moments'

during which we say it is not worth while commencing or finishing anything? Mr Smiles tells us that Dr Mason Good translated Lucretius while driving from patient's house to patient's house; that Dr Darwin composed nearly all his works in the same way; that Hale wrote his *Contemplations* while travelling on circuit; that Elihu Burritt while earning his living as a blacksmith mastered eighteen ancient languages and twenty-two European dialects in 'odd moments'; that Madam de Genlis composed several of her volumes while waiting for the princess to whom she gave daily lessons. Kirke White learned Greek and J. S. Mill composed *Logic* as they walked to their offices. Many of us get into a fuss if the dinner be not to the moment. Not so did D'Aguesseau, one of the greatest Chancellors of France, act. He used this *mauvais quart d'heure*, for he is said to have written a large and able volume in the intervals of waiting for dinner. Wellington's achievements were mainly owing to the fact that he personally attended to such minutiae as soldiers' shoes, camp-kettles, biscuits, horse-fodder; and it was because Nelson attended to detail in respect of time that he was so victorious. 'I owe,' he said, 'all my success in life to having been always a quarter of an hour before my time.' 'Every moment lost,' said Napoleon, 'gives an opportunity for misfortune.' Well would it have been for himself—as his bitter end proved—had this European bully known another fact—that every moment selfishly employed is worse than lost, and 'gives an opportunity for misfortune!' However, he attributed the defeat of the Austrians to his own greater appreciation of the value of time. While they dawdled he overthrew them.

It may be said that 'it is the pace that kills—that people nowadays are more prone to wear themselves out by overworking than to rust unused.' But is it not over-anxiety and want of method, rather than overwork, that kills us? Methodical arrangement of time is like packing things in a box; a good packer will get in half as much again as a bad one.

Little words and acts far more than great ones reveal the manner of a man. No one—in Great Britain at least—could be such a Goth as to rest his heels on the mantel-piece or to spit when sitting in the company of ladies round a fire. It is not, however, given to all to continue sinless as regards those many little things that mark the naturally refined man. Women are said to be better readers of character than men, and perhaps the reason is this: character is shewn by minutiae, and the fine intuition or mental sharp-sightedness by which these are discerned, belongs to women in a greater degree than to men.

Without caring in the smallest degree for goodness, we may avoid crime and gross sin because of the police, or because we desire to get on in the world, or because we are afraid of ridicule. The test, therefore, of a fine character is attention to the minutiae of conduct. Nor does the performance of those large duties which are almost forced upon us prove our love to God or to man nearly so convincingly as do the little commonplace services of love—the cheerful word, the cup of cold water—when rendered not grudgingly or of necessity. By little foxes tender grapes are destroyed, according to Solomon. Little foxes are very cunning and most difficult to catch; and so are those little

temptations by which our moral natures are gradually eaten away. The tender grapes of many a Christian branch are destroyed by such little foxes as temper, discontent, avarice, vanity. Many who could resist much greater sins yield to these. There is an excitement in the very greatness of a trial or temptation which enables us to resist it; while the chase after little foxes is dull and uninteresting. No wonder that when we analyse the lives of those who have ruined themselves morally, we generally discover that

It was the little rift within the lute
That, ever widening, slowly silenced all;
Or little pitted speck in garnered fruit,
That, rotting inward, slowly mouldered all.

How many people are almost successful, missing their aim by 'Oh, such a little!' Minutiae in these cases make or mar us. 'If I am building a mountain,' said Confucius, 'and stop before the last basketful of earth is placed on the summit, I have failed.' The examination is lost by half a mark. One neck nearer and the race would have been won. The slightest additional effort would have turned the tide of war. 'Thou art not far from the kingdom of God,' were solemn words, marking the terrible difference between almost and altogether.

A MASONIC INCIDENT.

WHEN the Territory of Kansas applied to the government at Washington for the privilege of adding another star to the national flag—now nearly twenty-five years ago—conflicting interests were involved in the very important question as to whether she should enter the Union as a free or a slave state. Some of the foremost abolitionists of the North were determined that no territory should be added to the Union as a slave state; Southerners were equally resolute that the limits of slavery should no longer be circumscribed; while others, affecting a more moderate temper, offered to leave the settlement of the matter to the people themselves who sought the more extended national relationship. At this time the public mind was in a highly excited condition. The effect of the iniquitous 'Fugitive Slave Law'—passed in a spirit of conciliation towards the South, and for assisting which, by his vote, the illustrious Daniel Webster sacrificed much of his well-earned reputation—had not died away when, in 1852, the statute was suddenly put into practical operation in the city of Boston, and a scene was there enacted which is without a parallel in American history. A negro named Burns having escaped from bondage, settled in Boston, and for some years had earned an honest living as a waiter at hotels and in sundry other occupations in which men of his race were accustomed to be engaged. The Fugitive Slave Law empowered slaveholders to follow runaways into free states and remove them therefrom; and Burns' owner having discovered the fugitive's whereabouts, resolved on the exercise of his newly-acquired rights. Burns was arrested and lodged in jail. The news spread with the speed and effect of an electric shock. The whole city was moved. With

youthful ardour many of the students of Harvard College (located at the neighbouring suburb of Cambridge) assailed the prison, with a view to the forcible liberation of the captive. So quickly had the riot assumed a portentous aspect, that a large force of police and soldiery was called into requisition to quell the disturbance. The representatives of the law succeeded in at once restoring peace and in placing in custody many of the students and other citizens who had attempted, though in vain, to render a humane service to an oppressed fellow-creature.

The quiet of the following day—Sunday—failed to allay the excitement which had seized the public mind. As the people issued from the various places of worship the proceedings of the previous day formed the general theme of conversation; groups of eager citizens were to be seen here and there discussing the outrage which had been perpetrated in the very 'cradle of liberty' itself.

Those who had been placed under arrest were, however, liberated shortly afterwards; and so soon as the necessary legal preliminaries were settled, arrangements were made for the transfer of the negro to his owner. Early on the morning of his removal, the streets in the neighbourhood of the jail were strictly closed against all traffic, by ropes, guarded by police, traversing their approaches. A cannon was placed in position on the court-house steps; and, still further to secure the captive against any probable attempt at rescue on the part of the populace, the police, supported by cavalry in the rear with drawn sabres, lined the thoroughfares through which he had to walk to the harbour, where a vessel was in readiness to convey him southwards. To add significance to this extraordinary scene, a coffin was suspended in mid-air on ropes running diagonally from the upper windows of the four corners of Washington Street, where it is intersected by School Street on the west and State Street on the east—the avenues through which Burns would pass—and most of the buildings in this locality were draped in mourning. Such space as was available for spectators was filled to overflowing with expectant citizens. The surging masses swayed to and fro with excitement; and when the slave appeared in charge of the officials, the murmured execrations of an indignant but law-observing multitude arose as incense. The ship lying in the harbour received him on board, and a fair wind soon wafted him beyond the reach of any manifestation of Northern sympathy.

Such, then, was the state of public or, rather, Northern feeling when Kansas, as already stated, applied for admission into the Union. The slaveholders of the South, and all in sympathy with them, adopted measures for influencing and, indeed, of controlling public opinion in Kansas on this great question; and to achieve this end, mercenary agents were employed to foster such 'slave' proclivities as might be apparent, and to instil them into the minds of the people, if their political sentiments were found to be tinged with

'free' tendencies. Not only was this virtually acknowledged, but it was discovered that preparations had been made for the exercise of physical force if need be. The Northerners, and more especially the abolitionists of the New England States, impelled by a righteous impulse to neutralise, as far as lay in their power, every unscrupulous endeavour to extend slave territory, sent arms to the inhabitants, to enable them to meet force with force. Jealousy of political ascendancy culminated in aggressive measures being adopted by the pro-slavery party. Espionage, with its attendant evils, was organised: men were tarred and feathered, and ridden on a rail or lynched, until the 'border warfare' was an acknowledged fact.

At this juncture, a literary gentleman named S—, strongly imbued with Northern zeal, but lacking the discretion which should accompany every important and worthy undertaking, decided on venturing into the midst of the disturbance, for the purpose of advocating anti-slavery principles by establishing an 'abolition' newspaper. He took a printing-press, type, paper, and such appliances as were required. His wife, not deterred by the length of the journey or the dangers which attended it, insisted on accompanying him on his perilous enterprise. After a journey of about one thousand five hundred miles, he settled near Fort Leavenworth, not far from the Missouri river, and soon completed his arrangements for starting his paper. Considering his surroundings, it was not likely that any great length of time would elapse before he acquired a reputation as a dangerous political intruder. His first issue startled the people immensely; but whether his anti-slavery vagaries, as they were considered, should be resented, or laughed at as an evidence of playful temerity, was for the moment a moot-point. The times, however, were not laughing times, and he was speedily a marked man. Intimations were conveyed to him by the process known as 'underground' that he had better relinquish his undertaking and hurry home to the east; and that in the event of his non-compliance with these hints, he would be waited upon by certain parties who made such matters their special vocation. In spite of these warnings, he continued to publish his unsavoury journal.

Amongst those who assumed the surveillance and guardianship of the public weal, political and moral, was one Dick M—. Dick was reputed to have been of respectable parentage, and to have spent his early days in peaceful circles; but the allurements of a desperado's life charmed him away to the sphere of action in which he was now engaged. His belt was amply supplied with the means of offence or defence, just as his 'appurtenances' might be required; and whether accompanied in his inquisitorial migrations by his followers or not, never failed to make his presence felt. In short, Dick was one of the most daring and blood-thirsty ruffians that could be encountered, and wherever he presented himself, dismay was widespread.

Very early one morning, as S— was printing his paper preparatory to its distribution, his office door was opened and several men entered. The ceremony of a formal introduction was dispensed with; his printing-press was smashed, his property destroyed, and the office itself quickly demolished.

Dick—for it was he—and his comrades arrested S—; but his wife was permitted to take leave of her husband on promising to return eastward without delay. The parting, under such circumstances, may readily be imagined; but in the absence of efficient protection to life and property, no reasonable alternative was left; the separation must be.

S— was speedily marched by his ignominious escort towards the Missouri. It was usual in such cases to 'string up' the delinquent to the first tree the parties met with; but on this occasion it was intended to convey the prisoner to such a place as might enable them to invest their proceedings with more than the customary spectacular effect. Such desperadoes considered it beneath their manly dignity to travel far without refreshment; they therefore soon stopped at a tavern to satisfy their conventional thirst. S— was placed in an arm-chair at the end of the saloon, while the masters of the situation lounged around the bar. Presently, Dick sauntered up to his captive and entered into conversation with him.

'Wal, stranger,' said Dick, 'I reckon you had better ha' stayed at New York, instead of coming to Kansas with them abolition notions o' yourn; we don't want no abolition out at Kansas.'

'I did not come out here,' S— mildly answered, 'for the purpose of creating discord, for it already existed; but simply and honestly to promulgate views which, in my conscience, I believe to be right; and I did it *because it is right*.'

'Wal,' blustered Dick, 'that kind of talk may do away at New York, but I callate it won't amount to nothin' out here. I can't believe any man would be sech a fool as to do sech a thing 'cause he believes it right. I don't believe you, nohow.'

'Well,' replied S—, 'if you were a member of a society I belong to, you would believe me.'

'What do you mean, stranger?' asked Dick with an air of wonderment.

S—, conscious of the hopelessness of his position, and fearing almost momentarily to be put to death, ventured: 'If you were a mason'—accompanying the remark with a certain sign usual in such emergencies—'you would believe me.'

To his utter amazement and infinite satisfaction, this chief of villains proved to be a freemason, having joined the fraternity in his reputable days, and fortunately for S—, still respected his obligations.

'Wal, brother, this is a kind o' awkward,' said Dick, in an altered and friendly tone; 'but I reckon I must save you. The boys will be mighty ugly though, when they see how things is. Now, when you hear the steamer whistle as she comes down the river, keep close to me, and follow me on board. I'll lock you in a cabin on deck, and as I know the cap'n, I'll make it all right. But look alive when she comes.'

They had not to wait many minutes before a shrill whistle announced the steamer's arrival. All left the tavern together, Dick marching ahead, and holding S— by the arm, as if leading an unwilling captive. As these two stepped on the plank thrown out for passengers to walk on from bank to deck, the 'boys' intuitively perceived the state of things, and made a rush towards the plank. Dick was equal to the occasion.

'Now, boys, make tracks!' said he in a tone

and manner that made obedience other than impossible. They accordingly withdrew, muttering threats of vengeance at the loss of their prey.

Dick hurried S— into a deck cabin, and without waiting for any expression of thanks for the service he had rendered, locked the door, and hastened to make all right with the 'cap'n,' according to promise. In a few moments the engines moved, the paddles revolved, and the steamer was under weigh for St Louis. Here S— disembarked; and again taking steamer for Alton, and thence cars to Cincinnati, was not long in meeting his wife in New York.

S—'s anti-slavery sentiments continued to the last as strong as in his early days, though, having an ever vivid recollection of his visit to the southwest, his utterance on this particular theme grew somewhat feeble. There was one topic, however, on which he waxed eloquent, and that was his gratitude to freemasonry for having, under Providence, preserved him from certain death.

FIGHTING FOR LIFE.

A STORY OF A WELSH COAL-MINE.

IN all parts of the habitable globe wherever the English language is spoken, a thrill of admiration must have passed through every English heart at the brave deed which was, in the earlier part of this year, accomplished in the Welsh coal-pit at Troedyrhiw.

There are times when a display of national pride is not only justifiable but necessary; and it is a splendid victory gained for humanity when we see a whole nation, heedless of every other event which is taking place around her, hanging breathlessly and with anxious face over the mouth of a pit in which a few poor miners are engaged in a hand-to-hand struggle with Death; tortured with doubts as to whether the imprisoned miners in the Troedyrhiw Colliery would endure their fearful hardships long enough to enable themselves to be snatched from a living grave. Happily, they did so, and were saved by the indomitable bravery of their fellow-miners. The whole story is one more splendid instance of the noble qualities which are innate in the breasts of those who form the sinew and the backbone of Britain; qualities that have won for her undying glory in war or peace, and by flood and field. How bravely death can be faced, and how bravely fought even in moments of doubt and despair, and at the risk of terrible perils deliberately encountered, is shewn by this story.

A miner's life is at all times a subject for grave study, for he must by mere necessity be a brave man, knowing as he does that every time he descends the shaft he literally carries his life with him in his hands. Indeed this thought must cross the mind of the most hardened man; and when he reaches the pit, the feeling must be intensified, for here his responsibility increases with every step he takes along the glistening black galleries of the mine. Not only has he his own life, but also the lives of others, now in his hands;

and the striking of a match may in an instant consign hundreds of his fellow-creatures to a fearful death in the bowels of the earth.

It was the writer's privilege, some few years since, to pay a visit to one of the largest and finest coal-pits in England—the Sheepbridge Colliery, near Chesterfield; the galleries of which extend in several directions for a long distance, covering altogether about three miles of ground, and passing in one place beneath a small lake. The sensation one experiences on descending the shaft, and seeing the light of day fading rapidly from view, is almost indescribable; and is only equalled by the exquisite feeling of relief which pervades the mind on once again returning to the surface.

An amusing incident occurred during our visit, which, though it was the cause of much hilarity at the moment, would seem on reflection to be, perchance, the innocent cause of many great disasters in coal-mines. As is probably well known, the miners in many pits, especially in those which are considered free from fire-damp or gas, work by the light of candles, which are stuck here and there against the walls of coal, a reserve of candles lying near at hand. These candles, the rats—the only living companions of the miners—make free use of when they can get a chance; and while we were watching the digging of some coal, one of these creatures came stealthily up to the spot and ran off with the lighted candle in its mouth. A volley of coal and curses flew after the robber; but it kept on its course until both rat and candle disappeared from view. But to our story.

It was on the evening of the 11th April, when the miners in the Troedyrhiw Colliery were leaving their work, that a roar of rushing waters was heard. The sound is one that is too well known to the ears of experienced pitmen, and the men at once fled to the shaft and were raised to the surface; but on arrival at the pit's mouth, fourteen of their number—men and boys—were seen to be missing. In an instant and without the slightest hesitation, volunteers nobly stood forward to undertake the task of rescue, and immediately descended the pit again, for the purpose, if possible, of bringing their fellow-miners to the 'bank' in safety. It was found that the water had broken into the mine through some old abandoned workings, and was flowing into all the stalls, headings, and galleries into which the mine was divided. The volunteers found also that all the workings within a few hundred yards of the bottom of the shaft were filled with water up to the roof, and it was at first concluded that all the fourteen missing ones were drowned. A knocking was, however, heard, as if some of the men were confined behind a wall of coal accessible from the outside; and the volunteers at once determined to cut through this wall, which they believed to be about twelve yards thick. The imprisoned men worked from their side too; and in a few hours the obstruction was so far removed as to enable the two parties to speak to each other. The tale

of the imprisoned men was, that the water was rapidly gaining on them, and one of them struck through the coal to escape from the rising water. But from one peril they immediately passed to another, for a violent explosion followed, and one poor fellow, Thomas Morgan, was found jammed to death in the hole which had been cut. This sad accident was caused by the sudden escape of air which was pent up in the 'stall' in which they had stood out of the way of the water, and the act of making the hole through the coal in so sudden a manner was equivalent to applying a match to a heap of powder or pulling the trigger of a gun. It was fortunate they were not all killed by the explosion.

After this, knockings were heard farther on in the mine; and it was soon made evident that the position of the other nine men was worse than that of the miners just reached. The wall behind which they were imprisoned was in a heading that was entirely flooded, and they could only be reached after part of the water had been pumped out. Divers were here employed, who went boldly into the flood, and gallantly endeavoured to proceed through the half mile of water which lay between the shaft and the imprisoned miners; but these were unwillingly compelled to relinquish the attempt. On Monday, however, four days after the flooding of the mine, the water was so far reduced as to allow the work of cutting through the coal to be commenced. And here we must pause to mention that this was done with a powerful pumping apparatus, which, with all its appliances, had to be properly and cautiously fitted up before it could be put into successful operation. The poor fellows below had been without food for some five days now, and it thus became a question of patient endurance on the one hand and of unceasing labour and noble efforts on the other. And never did men work more nobly than did those who were thus doing all that lay in the power of man to save the lives of their devoted comrades.

In spite of their indefatigable efforts, however, day after day passed by without any apparent result, for they had to cut through *forty yards of solid coal*, and the difficulty increased as the intervening wall became thinner. The anxiety of all concerned may be imagined when we remind our readers that this immense block of coal could only be penetrated at the rate of a yard per hour. But relays of men worked night and day with unremitting zeal until at length their efforts were rewarded with success. The imprisoned men were heard, and were able not only to speak to their deliverers, but also to give directions as to the course of the cuttings. 'Make haste! make haste!' was the plaintive cry which now nerved the hands and arms of the heroic workers, for it was like a voice from the grave which thus reached their ears.

Questioned as to their mode of existence in the mine, the prisoners said they had eaten absolutely nothing, that they were all very weak, and two of their number were completely prostrated. There were only four men and a boy there, the other four having been cut off from their fellows, and had, as since ascertained, perished. The little boy piteously implored the workers to make a hole for him to creep through to his mother. But in spite of their willing hearts, the brave

toilers were compelled to proceed more slowly and cautiously than before, in order to prevent the recurrence of a second disaster, by the too sudden escape of the pent-up air. And in addition to this, there was great danger of themselves being engulfed in the waters or killed by the gas, which soon began to make its unwelcome presence felt. Food was passed along a tube to the imprisoned men; but the tube did not work well, and it was eventually found that they had not received the much-desired refreshment. At the last moment, when the hole had been made and the compressed air was let out, a rush of gas took place which put out all the lamps and compelled the workers to return to the 'bank.' What must have been the horror of that moment to those poor fellows within the mine when they heard the retreating footsteps of their anxiously awaited deliverers!

Gloomy indeed was the prospect at this critical moment, for it had now become a question of life and death to either party; but were the men who had been rescued thus far to be left after all to the death which seemed to hunger for them? Perish the thought! and perish rather every Englishman who stood at the pit's mouth than that no attempt should be made to complete and crown the splendid story of those past eight days. The danger of carrying lights in the gas-charged mine being too great to be ignored, brave men came forward and volunteered to go down *without lamps* to the rescue of the five miners whom it was now known were the only ones who had survived that fearful time. Down they went into the black pit, carrying food with them, and on making another hole a gallant collier went into the mine and fed the poor fellows. All honour to him! It was a greater deed than the capture of an enemy's colours on the battlefield.

The rescued men and the boy were then brought to the surface, and placed under the care of experienced doctors, who pronounced favourably on their condition. For ten long weary days they had languished in the darkness of what seemed to them a living tomb, yet they murmured not, but lifted up their united voices in prayer to the great Creator of all.

The entombment of nine men, five of whom were known to be in a certain place, and could be saved by cutting through some forty yards of coal, made the question one of time and dogged perseverance on one side, and of hunger and patient endurance on the other. It is just on such occasions as these that the really splendid qualities of the collier shew themselves in bold relief, and turn a pitman into a hero.

Such a deed as this was certain to attract the sympathy of the gracious Lady who has ever the welfare of her people at heart; and the Queen hastened at once to give expression to the national feeling of admiration for these brave men, by extending the institution of the Albert Medal for saving life at sea to similar acts performed on land, and giving directions that these humble Welsh miners should be the first recipients of the honour.

A national subscription was also opened by the Lord Mayor, and a large sum collected for the rescued and their rescuers, sufficient to place them beyond the reach of poverty, and shew the world that England will not willingly let die the remembrance of as noble and heroic a deed as ever graced the annals of a Christian people.

QUACK MEDICINE.

Our ably conducted contemporary, *The Queen*, has the following useful remarks on the use of Quack Medicine:

'The belief in quack medicine is one which exists in strength proportioned to the ignorance of the persons who take it. There are certain charms, to some minds, in being able to "doctor" themselves, and to do without the properly authorised medical practitioner. There seems to be with these persons a sense that, in not having paid a fee for advice, they have in a manner gained something. There appears to be also a love of experiment, with a sense behind it that, if their own experiment fails, they can at worst fall back on the skilled physician to amend their mistakes, and to set them up again according to the known and acknowledged rules and practices of medical science. Moreover there is a kind of belief in empirical treatment, which is probably a "survival" from the ancient belief in charms and witchcraft; else how can people possibly put trust in medicines which are advertised as being adapted to cure all manner of diseases of thoroughly differing characters?

'But even among quack medicines there are degrees. There are some of which ordinary medical men readily avail themselves, and which under proper direction may be found really useful. The danger with regard to them is that persons finding such to be useful in the doses prescribed by their medical advisers, take doses on their own responsibility, which prove hurtful, sometimes even fatal in their effects. On the other hand there are a few—though we must confess very few—whose virtues chiefly arise from the faith with which they are taken; and these are as innocuous to the patient as they are profitable only to the vendor. But a very large class—in fact by far the largest—are really positively hurtful. They are described by titles which give no real idea of their character and composition, and they are taken by people much to their harm.

'In a recent number of the *Lancet* the public were warned against a seemingly harmless preparation, from the effects of which a medical man had found some of his patients seriously suffering. He found that lozenges called "castor-oil lozenges" were being largely used among his patients, who were under the impression that they were taking castor-oil in a form slightly less disagreeable than the usual one. On examination he found that each of these lozenges contained three grains of calomel; and it is not a matter of astonishment that he found some persons who had taken them suffering from severe mercurial salivation. He has found these lozenges sold by grocers, oilmen, chandlers, and even by surgeons and chemists, and the mischief done has been very great. The writer of the letter asks whether the Adulteration Act cannot be brought to bear upon those who sell this "pernicious confectionery;" but the bringing an Act to bear upon an evil is a slow process. The true preventive of mischief from the use of quack medicine is entire abstinence from its use. Who can doubt the propriety of this advice? Let quack medicines be universally abandoned.

A STRANGE FAMILY HISTORY.

For the following curious episode of family history we are indebted to a descendant of one of the chief personages involved; his story runs as follows.

Somewhat less than one hundred years ago, a large schooner, laden with oranges from Spain, and bound for Liverpool, was driven by stress of weather into the Solway Firth, and after beating about for some time, ran at last into the small port of Workington, on the Cumberland coast. For several previous days some of the crew had felt themselves strangely 'out of sorts,' as they termed it; were depressed and languid, and greatly inclined to sleep; but the excitement of the storm and the instinct of self-preservation had kept them to their duties on deck. No sooner, however, had the vessel been safely moored in the harbour than a reaction set in; the disease which had lurked within them proclaimed its power, and three of them betook themselves to their hammocks more dead than alive. The working-power of the ship being thus reduced and the storm continuing, the master determined to discharge and sell his cargo on the spot. This was done. But his men did not recover; he too was seized with the same disease; and before many days were past most of them were in the grave. Ere long several of the inhabitants of the village were similarly affected, and some died; by-and-by others were smitten down; and in less than three weeks after the arrival of the schooner it became evident that a fatal fever or plague had broken out amongst the inhabitants of the village.

The authorities of the township took alarm; and under the guidance of Squire Curwen of Workington Hall, all likely measures were taken to arrest or mitigate the fatal malady. Among other arrangements, a band of men was formed whose duties were to wait upon the sick, to visit such houses as were reported or supposed to contain victims of the malady, and to carry the dead to their last home.

Among the first who fell under this visitation

was a man named John Pearson, who, with his wife and a daughter, lived in a cottage in the outskirts of the village. He was employed as a labourer in an iron foundry close by. For some weeks his widow and child escaped the contagion; but ere long it was observed that their cottage window was not opened; and a passer-by stopping to look at the house, thought he heard a feeble moan as from a young girl. He at once made known his fears to the proper parties, who sent two of the 'plague-band' to examine the case. On entering the abode it was seen that poor Mrs Pearson was a corpse; and her little girl, about ten years old, was lying on her bosom dreadfully ill, but able to cry: 'Mammy, mammy!' The poor child was removed to the fever hospital, and the mother to where her husband had been recently taken. How long the plague continued to ravage the village, I am not able to say; but as it is about the Pearson family, and not about the plague I am going to write, such information may be dispensed with.

The child, Isabella Pearson, did not die; she conquered the foe, and was left to pass through a more eventful life than that which generally falls to the lot of a poor girl. Although an orphan, she was not without friends; an only and elder sister was with relatives in Dublin, and her father's friends were well-to-do farmers in Westmoreland. Nor was she without powerful interest in the village of her birth: Lady Curwen, of the Hall, paid her marked attention, as she had done her mother, because that mother was of noble descent, as I shall now proceed to shew.

Isabella Pearson (mother of the child we have just spoken of), whose maiden name was Day, was a daughter of the Honourable Elkanah Day and of his wife Lady Letitia, daughter of the Earl of Annesley. How she came to marry John Pearson forms one of the many chapters in human history which come under the head of Romance in Real Life, or Scandal in High Life, in the newspaper literature of the day. Isabella's parents were among those parents who believe they are at liberty to dispose of their daughters in marriage.

just as they think fit, even when the man to whom the girl is to be given is an object of detestation to her. Heedless of their daughter's feelings in the matter, they had bargained with a man of their acquaintance, to whom they resolved that Isabella should give her hand—be her heart never so unwilling. The person in question was a distant relative of their noble house, had a considerable amount of property in Ireland, and was regarded, by the scheming mother especially, as a most desirable match for her daughter. But what if the young lady herself should be of a contrary opinion? In the instance before us the reader will be enabled to see.

Captain Bernard O'Neil, the bridegroom elect, was nearly twice the age of Isabella Day; and although not an ill-looking man, was yet one whom no virtuous or noble-minded girl could look upon with respect, for he was known to be addicted to the vice of gambling, to be able to consume daily an enormous quantity of wine, and to be the slave of all sorts of debauchery. So habituated had O'Neil become to these degrading vices, that no sensible girl could hope to reclaim and reform him. The gratification of his propensities had been spread over so long a time that his entailed estate had become heavily burdened with debt, whilst his creditors, even his dependents, were clamorous for the money which he owed them.

Such being the man to whom the Honourable Elkanah Day and his noble wife had agreed to give their daughter, can it be wondered at that that daughter should not only be indisposed to comply with their wish, but should also be so disgusted and indignant at its expression as to give way to her feelings in words and acts which in themselves are incapable of justification? One day the captain had called at the house by appointment to arrange for the marriage, being anxious to have it consummated, that he might be helped out of a pressing embarrassment through the portion which he knew would be given to his bride. Isabella had been present at the interview. Her father and mother knew full well that she was far from being pleased with the match, but of this they took little heed, believing that once married, their daughter would reconcile herself to her lot, even if she did not derive much felicity from the union. The girl herself knew that no language of hers, whether of anger, sorrow, or entreaty, would avail, especially with her mother, who was one of the most hot-headed and stubborn of women; so from the first her mind was made up rather to circumvent than to oppose them; to cheat them in the game they were playing, if she could not by fair-play win the right to give herself where she could love and be loved.

On the occasion referred to, it had been arranged that the marriage should take place in a fortnight; and when she was urged to make the necessary arrangements, instead of yielding a hearty compliance, as in a different case she would naturally have done, she gave a feeble assent and left the room. No sooner had she put the door between herself and the other parties, than the emotions which she had managed to keep under while in their presence began to rage within her, and with the hope of finding sympathy below-stairs which was denied her in her proper domain, she sought the company of the maids. Wrath is

seldom discreet, and grief at times is not over-nice in selecting those before whom it vents itself. So without waiting to consider the rank of those whose company she had sought, or taking into consideration the consequences which might ensue on making known to them the circumstances in which she was involved, she gave expression to the feelings which were agitating her at that moment by exclaiming: 'So I am to be married in a fortnight, am I? And to that horrible O'Neil? Never, my honourable father; never, my lady mother! Never, no never! By God's aid, *never!* Rather than do so, I'll marry the first man who can be found willing to take me, and go with him to the ends of the earth!' Saying which, she fled from the kitchen into the garden at the rear of the house, and in the summer-house found relief in a flood of tears. All this occurred in Dublin.

Now the cook was one of those who heard the poor girl utter these passionate words. She was an old and esteemed servant of the family, and as such had more liberty and could use more freedom than servants in general. She had been in the family when Isabella, twenty years before, was born, had been her nurse, and was therefore greatly attached to her; and she felt more keenly the fate which the poor girl dreaded, than any others who were present. Indeed so afflicted was she on her account, that she sought her in the summer-house, and poured into her ear all the soothing and encouraging words she could think of. The girl's rage had abated, but she was in a condition of affliction and misery which was truly pitiable to behold. She was, however, still determined not to link her life to one whom she utterly detested, and besought her old and devoted friend to aid her in seeking in flight what she could not otherwise avoid. Whether the cook promised to do so, or what exact reply she made, I am not able to relate; but that very night an event took place which decided her fate, and gave to her after-life its direction and character. The cook was a native of Westmoreland, had been brought up in the neighbourhood of Fanner Pearson, whose son John was at that time a private in the Royal Guards stationed in Dublin. He and the cook were therefore old acquaintances, and when John had an hour to spare, he often spent it in her company. That very night he happened to pay her a visit. In course of conversation she told him about her grief arising out of the trouble of her young mistress, and added thereto the wild expression to which she had that day given utterance. This was done by the simple-minded woman without the least design either of aiding or injuring the young lady, nor had she at that moment the slenderest suspicion that her act would have any practical effect on the young soldier. But it was otherwise. He knew the girl by sight, and she knew him. Though they had not exchanged a word, nor been for even a moment in each other's company, yet they had on several occasions seen each other when he had been visiting his friend the cook. He was a fine open-hearted generous fellow, in the heyday of youth, fearless and brave. All his sympathies were aroused and drawn to the side of the suffering girl; and believing that he would be doing a truly manly act in rescuing her from what he regarded as worse than a thousand deaths,

he told the cook that he was prepared to go with her to the ends of the earth, should she be willing to trust herself to his care and fidelity; and he got his friend to promise that she would make his readiness known to her young mistress. Though the promise was made, it is but fair to say that in giving it the cook had not the smallest idea that the poor girl would do aught else than laugh at the proposal as a good joke. But herein she was deceived. Isabella Day caught at the offer of John Pearson the Life Guardsman, with an eagerness and a joy beyond description; she begged of the cook to arrange a meeting; it was done; and the result was an elopement and a clandestine marriage!

The day which ended the residence of Miss Day with her parents, ended her life of luxury and ease. They renounced her for ever. Her name was erased from the family register, and she was as completely severed from those she had left behind as if she had been buried in the family vault. The rage of her mother was fearful for a time; but Isabella was beyond its reach, and happy. Her husband was a fine-looking young fellow, tall, well-made, and handsome in feature and in form. He was also kind and gentle towards her; and whatever discrepancy existed between them before marriage, none was allowed to exist afterwards; for although he could not rise to her standard of refinement and elegance, nor give her the means of gratifying those tastes which her breeding and habits had fostered within her, yet they both had sense enough to know how to adapt themselves to each other; so their life, if not a luxurious one, was one of resignation and contentment. She followed him to those places to which his regiment was occasionally ordered; and when, in a year or two, he was invalided and discharged from the army, she retired with him to his native village of Burton-in-Kendal, and thence to Workington, where he found employment in the foundry at Beerpot. Two children were born to them, both girls; the elder of whom, as I have said, was on a visit to her relatives in Dublin; while the other daughter, Isabella, narrowly escaped death from the plague, at the time of her mother's decease, as I have narrated. I now resume my story at the period when she was left an orphan.

Lady Curwen, as has been intimated, undertook the necessary and, to her, pleasant task of befriending the desolate girl. She had been kind to her mother; indeed she thought it an honour rather than otherwise to be on friendly terms with her. She was a frequent visitor at the Hall, where she was received rather as a friend and equal than as a poor woman; for although she was in straitened circumstances, she was free from that cringing dependence which poverty is calculated to engender in those who are reared therein.

Her paternal relatives in Westmoreland also interested themselves in the orphan; so the bereaved child knew neither want nor scant. In a while she went to her uncle's homestead in Burton, where for a year or two she resided and thrived amain. But the sea and its surroundings had more charms for an ardent girl than the more sober associations of an inland life; she would rather scamper among the rocks and sea-weed of her native shore than ramble among the heather of her moorland home; and so, as time passed on,

she began to yearn after the earlier associations of her life. And inheriting the recklessness and determination of her parents, she, unmindful of obligation and of self-interest, carried out a long-cherished project: she ran away! While her uncle and his family were at church one Sunday morning, she went to the stable, and taking thence a cart-horse with which she had become familiar, she got astride upon his back, and bidding adieu to the farm and all its belongings, she set off to the place of her birth, which she reached safe and sound, but not without having attracted considerable attention from the onlookers on the way. Taking the horse to the inn, at which her uncle happened to be known, and requesting that it might be cared for until it was called for, she bent her steps to the well-remembered homes of her old neighbours, by whom she was cordially received.

She was at this time a fine blooming girl of twelve or thirteen years of age, tall, stately, handsome, with a natural aristocratic bearing, but remarkably unsophisticated and simple. Her return, and the way in which it had been effected, soon reached the ears of her late mother's friend, Lady Curwen, by whose influence she soon secured a good place as housemaid; in which position I shall leave her while I recount a fragment of the history of her elder sister Letitia.

I have said that her family renounced for ever their runaway relative. But in 'course of time an elder sister of the offender, who was married to a gentleman named Weeks, and living in London, relented of her animosity by occasionally corresponding with her, and sending her now and again what enabled her to keep a few marks of her former life about her. The children, however, were not visited with the same hostility as was their mother; they were inquired about, and, through a cousin who was known to the girls as Councillor Lennon, an occasional letter of recognition was sent them. This courtesy led to Letitia being sent for to Dublin, where she resided under the care of Lord Annesley for a few years. But what is bred in the bone is certain sooner or later to make itself visible; it was so in the case of Letitia: a disposition for frolic and adventure was in her; she found it difficult to conform to the rules of life which now held her in, and in spite of all restraint and watchfulness, she went into forbidden paths, and became at last a self-made outcast from her high-bred friends. The way was this: falling in with the steward of an American ship lying in one of the docks, and taken with his charms as he with hers, she agreed to a marriage and a flight with him like those of her mother. The chief difficulty which presented itself was how to get to America with her intended husband; but where there is a will there is mostly a way; both existed in this case, and proved successful. She adopted male attire, applied for and obtained a position which had become open on board of her husband's ship, that of assistant steward or cook, in which capacity she served in company with her husband during the voyage to Charleston. There she arrived in safety; her husband left off going to sea; and the last time her sister Isabella heard of her, she was mistress of a large and flourishing inn in the above city.

Some time after Letitia's abscondment, Lord Annesley, yielding to Lady Curwen's entreaty, and

perhaps to the voice of his own conscience as well, sent for Isabella, promising to give her the education and position of a lady, provided she would in all things conform to his wishes. The offer was a good and kind one, and presented temptation sufficient to induce an enthusiastic girl to yield thereto a ready compliance. The only means which Cumbrians had of reaching Ireland at that time was by the coal-vessels which regularly sailed from Workington to Dublin. In one of these Isabella Pearson set sail with visions of grandeur and greatness before her. But the winds and waves had well-nigh extinguished the lamp of hope which was burning so bright within her, for she had not been long on her voyage before a terrific storm broke upon the deeply-laden brig; it was impossible to make progress; it was hazardous to put back, for Redness Point, where many a noble ship had been wrecked and many a precious life lost, stood threateningly behind them. At last, however, the master of the brig made for the Scotch coast, and happily succeeded in gaining the port of Kirkcudbright. Here our heroine remained with the vessel nearly a week, when the weather permitting, the voyage was again attempted, and without further mishap accomplished.

Isabella Pearson was received into the mansion of her noble relative with becoming friendliness. I have heard her, in her old age, describe his lordship as being a fine-looking venerable man, with a head white through age, an eye beaming with kindness, and a heart brimful of love. He had had the misfortune to lose a leg, and like many of his lowlier brethren, had to be content with a wooden one. With him she spent a few happy months; and at length became as familiar with the ways of those in high rank as she had been with those of her own class. I cannot say how long this new life lasted; but it is certain that as time passed she began to feel her lot irksome, and to long for the less elegant, but to her more pleasurable life she had previously led. The fact is that, as in the case of her sister and her mother, Cupid, small and child-like though he seems, was far more powerful than wealth and fashion, and all other attractions of aristocratic life. While living as a domestic servant in Cumberland, she had fallen in with a young sailor, who had run away with her heart. When she set sail for Dublin she had a hope that nothing would happen to prevent her from yielding to her wishes to become his wife; but she had not been long her relative's guest before she was forced to come to another conclusion; for she saw plainly that her worthy kinsman had set his heart upon fitting her to become something better than a common sailor's wife. A lady had been engaged as her governess and a time fixed for her arrival; but before the time came the inbred spirit of freedom had again asserted itself, and Isabella had bidden adieu for ever to Lord Annesley and all the good things which his kindness had gathered around her! A collier brig took her back to her native village, and soon after she became the wife of John Ruddock, able seaman.

No one can justify, though all may extenuate, the conduct of Isabella Pearson; nor can any one be pronounced harsh and unfeeling who may say: 'The suffering that might fall to her lot in after-life was the result of her folly and recklessness.

On the other hand, it may be pleaded that her heart was her own, to give to whom she pleased; and as it had been sought for and gained by the young sailor, her happiness could only be secured by living with him; therefore she did right in preferring his lot to the wishes of her noble uncle. Be this as it may, she grievously erred in quitting him in so heartless a way after the tender care she had received at his hands. And this she afterwards acknowledged. After her marriage, her husband left the sea, and taking his young wife with him to Durham, he there found employment as a sail-maker, in which art he was proficient. A letter, professing repentance, was written to her uncle; but before it was posted the death of Lord Annesley was announced; which event put an end for ever to all hope for help or favour in that quarter. Soon after, a pressgang laid relentless hands upon poor Ruddock, and dragged him on board a ship of war; so once more our heroine was forced to seek her living in domestic servitude. But herein she was not able long to abide, for the birth of a daughter made such life for a while impracticable. Sad as was her lot, it soon became worse; for her poor husband was killed in an engagement off the coast of Spain, and with many other brave hearts found an early grave in the ocean's bed.

Isabella was now left with a young child to fight the world alone. Health and vigour, however, were her portion; and hearing that plenty of work for women was to be had at Cleator near Whitehaven, she repaired thither, and found a settlement and a living. While there, she was one day agreeably surprised by a visit from her kind friend Lady Curwen, who had driven from Workington Hall expressly to tell her that an advertisement applying for the heirs of John Pearson who worked in Beerpot Foundry, had that week appeared in the columns of a London newspaper, and urged her to attend to it. But she was illiterate, was unused to business habits, and being alone and helpless, put off the matter day by day, until at last she gave it up altogether. What might have come out of this, is of course unknown to the writer; but Isabella herself believed—I do not know why—that her aunt, Mrs Weeks, had died, and had bequeathed to her sister's children a considerable sum of money.

Time passed on, and her child grew, developing among other things a love of mischief; for one day, while her mother was at the mill where she wrought, she got to the box in which were kept her mother's cherished family documents and letters, and amused herself by setting them ablaze one by one at a lighted candle got for the purpose! Thus, in one half-hour, every document necessary to prove her mother's pedigree was destroyed, and with it all hope of bettering her position was thrown to the winds; so, when some years afterwards, Lady Curwen sent a messenger to tell her that the advertisement I have named had once more appeared in the public prints, she paid no attention to the information, satisfying herself simply with an expression of thanks to her kind benefactor!

She was, however, content with her lot. Her child was her chief comfort and joy. For her she toiled in the mill by day, and in her humble home at night; and as she grew in stature and in beauty, the mother's heart throbbed its grati-

tude and her eye beamed with admiration. But on one occasion she had nearly lost her. Playing one fine afternoon on the bank of the stream which drove the wheel belonging to the mill, her feet slipped, and she fell in. A man who happened to be a little in advance, had his eye drawn to an object on the water, which he at first took to be a quantity of loose hair; but another glance revealed to him the head of a little girl beneath the surface of the rapid stream. He ran and was just in time to lay hold of the hair as its possessor was falling over on to the wheel. Another moment, and Jane Ruddock (the drowning girl) would have been no more; in which case he who now pens these fragments of a strange history would not have been in existence—for that little girl became his mother.

I have little more to add. Isabella Pearson, who, as I have shewn, became Isabella Ruddock, wife of a common sailor, once more entered the matrimonial lists; but she neither improved her position nor increased her happiness by so doing. Indeed her life, while her second husband lived, was embittered by his love of strong drink. But she survived him. She was a widow the second time when she became familiar to my youthful eye. Many a merry hour have I spent in her company. Often I have heard her relate the incidents which make up this story. She was a fine, tall, handsome woman while health remained with her; she had also a large womanly heart, a hot impetuous temper, and a remarkable simplicity and honesty of character. She died in 1849, weighed down with years and infirmities; but she ended her eventful life in much patience and peace.

A LADY'S ASCENT OF THE BREITHORN.

FANCY the following tableau. Scene—Switzerland; time—August 1875, at a desolate rocky part of the Surenen Pass. A group—Youthful grace and vigour; manly strength and endurance, &c. Fore-ground—Four heads eagerly bent over a huge bowl of *café* placed on a board, which is extended over four laps. Hands belonging to said heads ladling the mixture into their mouths with large wooden ladles with little curved handles, between convulsions of mirth. Background—The chalet of the Waldnacht Alp, from which the realistic artist should cause hideous odours to ascend in the form of dense vapour. At the door of it, the unwashed and scantily clad figure of a Swiss herdsman, fearful to behold, owner of chalet, and like Caliban himself, chattering an ominous jargon, and grinning at the English feeders. Right of background—Attendant guide, cheerful and pleased that he has at last secured some sustenance for his 'leddies,' who have been walking from eight A.M. to four P.M., and will yet have to go on till three-quarters of an hour after midnight. These tableaux, with minor variations, were frequent in our tour.

After many adventures and many jokes, after being lost in a pass from eight o'clock to ten, when the sun had set, and having to wander about for those two hours on the edge of a precipice guiltless of path, being finally rescued by a heaven-sent and most unexpected peasant with a lamp—after these things and their results, which were blackened complexions, dried skins, and dilapidated costumes, we arrived at Zermatt, where we

settled down for a time. The object of the settling down was in one word—ascents.

Nothing much, according to the men, had yet been done, though we in our secret hearts hugged the proud thought that Pilatus had not defeated us, and that the Twelfth-cake-like snows of Titlis had been pressed by our tread; that the Aeggischohorn, though it had witnessed (N.B. at the end of a long day) the heat and perspiration which dimmed our few remaining charms, and had heard our smothered groans, had had in the end to feel our light weight upon its summit, and to bear us as we gazed with awe at its mighty circle of peaks. But what do these avail? In the eye of man they were mere preparation for mightier things.

After some debate, mingled with faint remonstrance on our part, when Monte Rosa was mentioned, the *Breithorn* was decided upon; and the manly spirits, which had become depressed by a few days' lounge, arose. Such is the enigma Man! The day was fixed, an extra guide (one Franz Biener—known as Weisshorn Biener) engaged on the night before we went up to the Riffel. After a few hours' disturbed sleep we were awake at two; and dragging our weary and daily emaciating bodies from the beds where they had not been too comfortable, we dressed by the flickering light of a candle; and as we dressed, my friend and I cast fearful looks out at the Matterhorn, which fiercely pierced the dark sky, and seemed to say to me in the words of the poet:

Beware the pine-tree's withered branch;
Beware the awful avalanche!

As I put the last finishing touches to my collar at the glass, my feminine pulses slightly quickened to the tune of—'This was the peasant's last good-night;' and though no voice far up the height replied 'Excelsior!' yet a voice came from outside which meant in downright English very much the same thing; and my reflections were quenched in the carousal down-stairs, which I hastened to join. An unfortunate and sleepy maid was ministering to the wants of my friends in the dimly lighted salon of the Riffel-haus. Outside, the guides were impatiently stamping about in the frosty night, and complaining of the length of our delay, insinuating that the sun would soon be up. The fact is the preparations of toilet on our part were complicated. The uninitiated may not know that the feminine clothing of the present time, elegant though some may think it, is not conducive to comfort in mountain climbing. A well-tied back *tablier* has a restrictive influence upon the free movement of the lower limbs, and only admits of a step of a certain length. In rock-work it is felt to be peculiarly irksome, and in soft snow it is trying to the temper.

Let the imaginative reader then, if he be able, picture two young women devoid of *tabliers*, and so at once removed from the pale of polite society. I tremble as I write with the fear that this avowal may remove from me and my companion that feminine sympathy so dear to our hearts. But I must descend a step lower. Freedom from *tablier* was not sufficiently radical. Our skirts must be carefully pinned up round our waists à la washerwoman, so that our progress be perfectly unimpeded; and armed with masks and spectacles we sallied forth into the darkness—a party of six. I shall not easily forget the delicious exhilaration

we felt as we hastened along towards the Gerner glacier. The dark cold air touched our faces crisply, and feelingly persuaded us of the advantage of the sun's absence.

The searching sensation of being about to commit a crime, attendant on nocturnal adventures, clung to us, and we were filled with a vague remorse, in which we felt at one with Eugene Aram. At the same time the ridiculousness of our position soon wrought upon us to such a degree that we profaned that wonderful silence with unholy bursts of laughter. Our festivity ceased when we reached the glacier, for there we broke up into line, the ladies being tenderly taken possession of each by a guide, who soon got us over a rough moraine. The glacier we found unpleasantly slippery; and it was exciting work, as at the point where we crossed it was very much crevassed, and steps had often to be cut. The nails on our marvellous boots answered admirably, and we sprang about with great sure-footedness and with exquisite enjoyment.

The leader of our party was in a rather dangerous plight, for he had had no nails put into his boots, and we felt quite anxious as through the dim light we noticed his uncertain movements. How he got across with the ice in so bad a condition, is a marvel! We had been on the glacier about an hour when the light began to creep up over the mountains, and we were in the midst of a scene of wonderful beauty. The Monte Rosa, the Lyskamm, Castor and Pollux, the Breithorn, the Masterhorn, and many another shrouded in their utter whiteness stood round us in awful calm, closing us in upon a lake of tossed and heaving ice. The moonlight which streamed down upon us on one side, and the pale yellow light of the dawn on the other, lit up the scene with a weirdness which seemed not of our world. We saw each other's phantom-like figures gliding about, and felt that we were too real to be there—a place where only ghosts had any right to be. The feeling that pressed upon me was that I had suddenly intruded into nature's holiest of holies. It seemed as if some secret of a higher life than this was being sighed through the air, and that I, with all my earth-stains on me, could not rise to the understanding of that secret. Yet on that early morning in August, in the same world far away, the same London was going on in the same old way we knew so well. Cats were even then stealing along suburban walls; cocks were beginning to practise their crescendos, tired-out citizens were tossing in oppressive four-posters, dreaming tantalising dreams of cool sea-breezes not for them; while round all must be clinging that heavy breathed-out air, which of itself is a very *inferno* in contrast with the mountain ether.

By the time we had reached the upper plateau of the St Théodule glacier, it was light, and we were all roped together. The process of roping in this enlightened age I feel it to be unnecessary to describe. Thus we marched along that profound and frozen solitude tied together in a long line. The snow was as hard as a road, and the cold intense. Biener is an excellent guide, but his pace is very slow, and thus we got rather benumbed. We had, however, passed the Little Matterhorn on our left, and the Théodulehorn on our right, with the little rude *cabane* erected on the rocks at its foot—more than eleven

thousand feet above the sea, and the highest habitation in Europe—and were beginning to trail our snake-like length up the snow-slopes on the west and south of the mountain, when my friend became so unmistakably ill that we came at once to a halt and a consultation. She (to her honour) much wished to go on, in spite of sickness, giddiness, faintness, and a livid complexion; but as that was out of the question, she was untied from the rope, and sent back with our ordinary guide (a first-rate fellow, one Johann von Aa) to the hut already mentioned.

When we reached the actual snow-fields of the Breithorn, I had to learn that the work of my day had scarcely begun. As the sun rose, the snow began to get very soft, and instead of going in to my knees, as I had expected, I literally waded in it up to my waist. With mighty efforts I lifted up my already wearied legs and plunged them into ever fresh pits of snow, where they frequently became so firmly imbedded that, struggle as I might, I could not move; and presented to the spectator the hapless object of half a woman masked and spectacled, striving and panting. From an æsthetic point of view I cannot say I felt myself a success; but from a moral point, I felt myself a very finger-post through the ages. Truly I had given up my all in the shape of appearance, and had offered myself up on that altar of adventure on which so many braves of my country have been sacrificed. The mode of rescue from the uncomfortable position indicated above was almost as bad as the plight itself. I feebly kicked; you can't kick boldly with your legs in tight pits; and the guide dragged at the rope which bound my waist, and then out I came like the cork out of a bottle. Two hours and a half of this sort of thing went on, varied by refreshments and occasional rests for breath-taking, but still it appeared to me that we were always at the same spot, and ever the glittering summit from afar mocked my helpless gasps. At last (ah! what an at last!) the final slope—really the final one—stretched right up before us. A party of men who were engaged in scientific experiments peered over at us; and with one last desperate effort I found myself landed amongst them at the top of the Breithorn, and thirteen thousand seven hundred feet above the sea. As we placed our feet upon the summit we groaned the groan of triumph, and gazed with awe around us upon the inexpressibly magnificent scene which spread itself out before us. A mighty circle of mountains stood in awful calm around us. Every fantastic line, every curious heaping, every wild wreck, every gleaming curve of glacier possible to mountains, seemed gathered together before us. Each peak had a proud originality of its own, which shewed through all the sameness of the uniform whiteness. But the spirit of these places is the most wonderful thing about them. The clamour, the struggle, the unrest, which make up to most of us the atmosphere of this world, seemed in these regions to have been left behind in a past state; and this in a way was illustrated by the scene itself. The contorted forms and tossed rocks spoke of struggle, gradual it may be, but still struggle. But in the serenity surrounding those unearthly peaks there was a peace which seemed to have left struggle far behind—the repose of a wide knowledge gained only through sore fight and aspiration.

A short time of peaceful dream was allowed me, and that was rather marred by the intense glare of the light, and then we began the descent. In an evil moment of rest some little way down, I left hold of my alpenstock and leaned it against my shoulder. In a moment it was gone—down, down, sliding skittishly away, till my heart was pained by its final leap into a crevasse far away. As I looked, I imagined what a crash my skull would have come at the bottom of that crevasse. I afterwards found out that the alpenstock was not my own, as I then thought, but that I had inadvertently changed with one of our guides. Imagine my grief at the thought that I had lost the dear companion of my travels, that staff which had guided my wavering feet and upheld my tottering body through passes and up mountains, and which I intended to preserve until my death! My situation without it was rather perilous, and would have been more so had not the snow been very soft. But the guide took me entirely in charge, and lent me his axe, which I was certain I should recklessly lose after the same fashion. After a weary time, Biener the guide decided to *glissade* me. I was resigned. What else could I be? By that time I was very resigned. He took off his coat, and made me sit down upon it, then tied my skirts around me. A rope was attached round my waist, one end of which was grasped by Biener in front, and the other by my gentlemen friends behind. Then ensued a process in which my limbs were nearly severed from the body, and in which I suffered greatly. Biener rushed down the slope dragging me behind him; while the gentlemen, unaccustomed to this sort of thing, and not being able to go fast enough, hung a good part of their weight on to the rope behind, and so almost bisected me. I never expected to be an individual whole again; halves were my fate. Never was creature in so miserable a plight. No Procrustean bed could have produced greater tortures than those I suffered as I sped down that miserable slope. I shouted all the French I could think of to Biener to stop him, and rid me from the hideous rope, which cut me like a knife; but the air would not carry my words, and on I skimmed and floundered. At last he heard my cries, and released me from the fetters. The fact was that the gentlemen were quite unable to keep up with Biener in the deep snow, with the dismal result, as seen above, of almost cutting through my waist. The lesson to be deduced from this is the simple maxim I commend to all my feminine readers: *Never*, under the most favourable circumstances, *glissade*.

When we reached the cabane where my friend was waiting for us, we were met by Johann, who told us with a long-face that the 'leddy' would not eat anything, and was very sick. We found, to our sorrow, that she had been in a miserable condition all day, and had suffered dreadfully from mountain sickness. She was so ill that it was impossible she could walk, and we were a long time in deciding what was to be done. Now, a helpless invalid, at a height of over eleven thousand feet above the sea, is not a being easy to legislate for. At last a litter was contrived. A chair was placed on some alpenstocks; and an American gentleman whom we met at the cabane being kind enough to lend us his porter, we found hands enough to carry her part of the

way at least, to Zermatt; the Riffel-haus, where we were staying, being out of the question, on account of the Gorner glacier and its moraines and rocks, which would have to be passed to get there. Our party, sad to say, had then to separate, two of us going to Zermatt and two to the Riffel. The melancholy *chaise-à-porteur* procession wended its way to Zermatt; and with considerably damped spirits we went on to the Riffel, which we reached at about half-past six P.M. The ambulance party did not get to their destination till eight o'clock.

All that remains now to be told of this our adventure is the sad result. The next morning, on waking from sleep, I found that my ear adhered to the pillow; and when, with much trembling I approached the glass, a spectacle presented itself to me which I can never forget. As I gazed at the grotesque reflection of myself, I inwardly vowed that no mask of London make, elegantly worked as it might be, should ever cover my face again. A large flapping cover-all mask 'of the country' let me recommend to ladies who go up snow mountains. I was swollen; I was black; I was hideous! Half of the skin of one ear was hanging by a shred, and the ear itself was a blister; while all round my neck from ear to ear was a chain of blisters. Their state was so bad that the dressing of them by one of our party (a doctor) took half an hour, and I could scarcely turn my head. It required a good deal of courage to face *table-d'hôte* and the young ladies who were indulging in complexions and large portmanteaus. But I did! Would that I could say I enjoyed it. I did not enjoy it. The complexions of the scornful and the scorn itself, embittered that meal, usually attended with such joys. In my travelling afterwards, I became accustomed to the searching glance at my poor tattered skin and to the remark: 'I see you have been doing glacier-work.' And it was not until a month of English life had to some extent repaired me that I could look back with delight and triumph to the ascent of the Breithorn.

ECCENTRIC PEOPLE.

MR TIMBS, in his book upon *English Eccentrics and Eccentricities*, introduces us to a collection of funny people, with whom it is good company to pass an hour. To get away from the dull routine of conventionality for a while is at all times a relief, more especially when we fill the interval by watching some of our eccentric fellow-creatures who are good enough to divert us by their antics. Some are serious in their folly; some are mad; some we admire, while others again awake our pity; but one and all they are gifted with a force of will that merits attention.

A collection of dead-and-gone eccentrics now pass before us, recalling a few living ones that we know of, whose collected vagaries, if published, may in turn probably amuse our grandchildren. First, let us look at Beckford, a name not much remembered now, although it belonged to a man who was a marvel in his day. Gifted with extraordinary powers of mind and will, he did everything by turns, and nothing long. He wrote a book that created a sensation. No great marvel that, to people of our day, when the difficulty is to find

some one who has not written a book ; but Beckford wrote as no other author. *Vathek* was written at one sitting ! It took him three days and two nights of hard labour, during which time he never undressed. We know of one instance somewhat similar. A reigning lady novelist told us once that she was pledged to her publisher to send him a three-volume novel by a certain date. Two days previous to the expiration of her contract, her novel had only reached the opening chapter of the third volume. On the evening of the first day she went to a ball, danced all night, returning home at the small-hours of morning, when, after taking off her ball-dress, and drinking some strong tea, she sat down to finish her task. All that day she wrote and on into the next night, never leaving her desk until she had written *finis*; when with trembling hands she despatched her manuscript in time to fulfil her engagement.

There are some natures that need the pressure of necessity, or self-imposed necessity, to goad them into action ; their resolution once formed, no obstacle is suffered to come between them and its fulfilment. Beckford was one of these. He determined to build a house—the abbey at Fonthill, where he resided for twenty years—and swore by his favourite St Anthony that his Christmas-dinner should be cooked in the abbey kitchen. Christmas approached, and the kitchen was in an unfinished condition. Every exertion that money could command was brought to the task, and Christmas morning saw the kitchen finished and the cooks installed. A splendid repast was prepared, and the dinner actually cooked, when lo ! and behold, as the servants were carrying in the dishes through the long passages into the dining-room, a loud noise was heard, and the kitchen fell through with a crash ! But what cared Beckford ? He was rich ; he could afford to build his kitchen over again ; ~~meanwhile~~ he had humoured his whim and kept his vow to St Anthony ; and we may add, made good his title to eccentricity, for which we applaud him, and pass on to watch some others.

What sorry figure is this that comes next ? A poor neglected imbecile, living in squalid lodgings at Calais. It is scarcely possible to recognise in this unhappy being the once gay and elegant Beau Brummel, the glass of fashion and mould of form to the men and women of his generation, whom he ruled with the despotism of an autocrat. Yet this is the poor Beau and no other. He is holding a phantom reception. Having desired his attendant to arrange his apartment, set out the whist-tables, and light the candles—alas ! only tallow—he is ready at eight o'clock to receive the guests, which the servant, previously instructed, now announces. First comes the Duchess of Devonshire. On hearing her name the Beau leaves his chair, and with the courtliest bow, the only reminiscence of his departed glory, he advances to the door and greets the phantom Duchess with all the honour that he would have given the beautiful Georgiana. He takes her hand and leads her to a seat, saying as he does so : ' Ah, my dear Duchess,

how rejoiced I am to see you ; so very amiable of you to come at this short notice. Pray bury yourself in this arm-chair. Do you know it was the gift to me of the Duchess of York, who was a very kind friend of mine ; but poor thing, you know, she is no more ! ' At this point tears of idiotcy would fall from his eyes, and he would sink into the arm-chair himself, awaiting the arrival of other guests, who, being duly announced, were similarly greeted. With these ghosts of the past he would spend the evening until ten o'clock, when the servant telling each guest that his or her carriage was waiting, would carry his poor old master off to bed. We cannot wish him good-night without the payment of a sigh for the pantomime he has acted and the sad lesson it conveys.

And now we conjure up a droll figure, whose eccentricity borders on madness, the spendthrift squire of Halston, John Mytton. He is tormented with hiccup, and tries the novel cure of setting fire to himself in order to frighten it away. Applying a candle to his garment, being sparsely clad at the time, he is soon in flames. His life is only saved by the active exertions of some people who chance to be in the way at the time. He invites some friends once, and when the company are assembled in the drawing-room, he startles them all by riding into the room on a bear ! The guests are panic-stricken : one mounts on a table, another on a chair ; they all strive to make their escape from the ungracious animal, and its still more savage master, who is enjoying the misery of his guests with the laugh of a madman. Let us too leave him.

Ladies have a great field for the display of eccentricity, in their mode of costume. We know of one lady who has never altered her style of dress since she was eighteen. The consequence is that every ten years or so the fashions come round to her, and for a brief period she is *à la mode*. Never having made any concessions to the abominations of crinoline or false hair, she is at the present time more orthodox than she appeared five years ago. Every time has had its eccentricities in this respect, and Mr Timbs shews us a certain Miss Banks, who died in 1818, and in plain terms looked a ' regular guy.' She was a lady of good position, being the sister of Sir Joseph Banks. Her costume consisted of a Barcelona quilted petticoat, which had a hole on each side, for the convenience of rummaging two immense pockets stuffed with books of all sizes, which did not add to the symmetry of her already large proportions. In this guise she went about, followed by a footman carrying a cane, as tall as his mistress, or her luggage when accompanying her on a journey. She was the originator of the words *Hightum*, *Tightum*, and *Scrub*, which so many ladies are fond of applying in the order of precedence to their wearing apparel. These words Miss Banks invented to distinguish three dresses she had made for herself at the same time, and all alike ; the first for best, the second for occasional, and the third for daily wear.

While on feminine eccentricities we must record some that we have met with in our own day. So convinced is one elderly married lady of the peculating propensities of all lodging-house menials, that after each meal a curious scene takes place in her room. Every article, such as her tea-caddy, sugar-basin, jam-pot, &c., which she has had occasion to use during the meal, is placed on the table,

on which stand a gum-bottle, a brush, and several long strips of paper. She then proceeds to gum up her property. A strip of paper is gummed round the opening to the tea-caddy; the pot of preserve is similarly secured, together with all else that is likely to attract that lawless fly the lodging-house servant! We know of another lady who for years has lived with only the light of gas or candle in her rooms. She imagines that air and daylight are injurious to her sight, and her rooms are little better than well-furnished tombs, into which no chink of light or breath of heaven is suffered to intrude.

Mr Timbs introduces us to a lady equally eccentric in her ideas about water. Lady Lewson of Clerkenwell objected totally to washing either her house or her person. She considered water to be the root of all malady, in the unnecessary way people expose themselves to the chills caught by frequent ablution! And as for health—was she not a living instance that a morning tub is all nonsense, for she was one hundred and sixteen years old when she died! For the greater part of her life she never dipped her face into water, using hog's-lard instead, to soften her skin. Although large and well furnished, her house, like her person, was never washed and but rarely swept.

We remember an amusing instance of French respect for cold water, in the speech of a French gentleman, married to an English lady of our acquaintance who used to indulge in a bath morning and evening; a custom so astounding to her husband that he exclaimed in our hearing: 'She does not use water—she *abuses* it.'

Eccentricity often displays itself in an inordinate affection for animals and a singular manner of treating them. An instance of this was the late Earl of Bridgewater, who now comes before us with his family of performing dogs. He lived in Paris during the last century, where the circumstances we narrate took place. He was a miserable-looking little man, unable to walk without the support of two lackeys. He had an immense fortune, which he spent in gratifying every caprice. Was a book lent him? It was regarded as the representative of its owner, and returned in the earl's landau, occupying the place of honour and attended by four footmen in costly livery, who handed it to the astonished owner. His carriage was frequently to be seen filled with dogs, his special pets. On the feet of these dogs he bestowed as much attention as though they were unfortunate human beings; he ordered them boots, for which he paid as dearly as for his own. Not caring to entertain his own kind at his table, few people dined with him. Still, covers were daily laid for a dozen, served by suitable attendants. At this table he received, and dined with no less than twelve favourite dogs, who seemed to comprehend the compliment paid them, as they occupied their chairs with decorum, each with its white napkin tied round its neck. They were so trained, that should any, by an instinct of appetite, transgress any rule of good-manners, he was banished from the table, and degraded to an antechamber, where he picked his bone in mortification; his place remaining empty until he had earned his master's pardon.

There are some whose eccentricity takes the form of hatred of society. Of this number was

the Honourable Henry Cavendish, a man of great learning and enormous fortune, who earned the title of 'Woman-hating Cavendish,' as he would never see a woman if he could avoid it. If a female servant was unlucky enough to shew herself, she was instantly dismissed. He was compelled to employ a housekeeper, but all their communications were carried on by correspondence. His ideas of dining were restricted to legs of mutton only. On one occasion when his housekeeper suggested that one leg of mutton would not be sufficient for a party invited, he met the difficulty by ordering *two*!

A number of eccentricities are displayed by people in their burial bequests. A certain Dr Fidge, a physician of the old school, converted a favourite boat into a coffin, which he kept under his bed for many years in readiness. When death drew near, he begged his nurse to pull his legs straight and place him as a dead man, as it would *save her trouble afterwards*, saying which he comfortably departed. Job Orton, a publican of the Bell Inn, Kidderminster, had his tombstone with epitaph erected in the parish church. His coffin was also built and ready for him; but until he was ready for it he used it as a wine-bin. Major Peter Laballiere of Box Hill, Dorking, selected a spot for his burial, which he directed should be without church rites, and *head downwards*; in order that, 'as the world was in his opinion topsy-turvy, he might come right end up at last!' But a certain Jack Fuller caps even the major, for he left directions that he was to be buried in a *pyramidal* mausoleum in Brightling churchyard, Sussex; giving as his reason for selecting to be embalmed in stone *above* ground, his unwillingness to be eaten by his relatives—a process he considered inevitable if buried in the ordinary manner, for 'The worms,' he declares, 'would eat me; the ducks would eat the worms; and my relations would eat the ducks.'

Of all eccentricities, those displayed by misers are the most notable and repulsive. To dwell upon them at any length is neither pleasant nor interesting; it is only where parsimony and genius are allied that one pauses to examine the specimen. Let us now take a brief survey of Nollekens the sculptor, in whom these opposites were met. Descended from a miserly stock, he did not fall short of his ancestry in his love of money, and it first became apparent in a filthy mode of living while a student at Rome. He married a woman even more parsimonious than himself, and their housekeeping was pitiful. Hatred of light is an observable trait with most misers; and over their coals and candles the Nollekens were scrupulously economical; the former, Nollekens counted with his own hands. The candles were never lighted at the commencement of the evening; and if a knock were heard at the door, it was not answered until repeated, in case the first should prove a runaway, and the candle be wasted! A flat candlestick served them for ordinary purposes, and by carefully extinguishing them when company went, they made a pair of moulds last a whole year!

Before his marriage, Nollekens had an unfortunate little servant called Bronze, whose appetite he so feared that he placed her on board-wages, and gave her only just enough money to furnish him with food each day, which he took care to con-

sume. Bronze with rare patience, for which we cannot account, continued to serve after her master was married, and declared that never had she seen a jack-towel in their house and never had she washed with soap! Mrs Nollekens never went to any but a second-hand shop for their wearing apparel and shoes, and their charity was of the same second-hand nature, as when Mrs Nollekens directed the maid to give the 'bone with little or no meat on it' to two starving men who applied for relief. If a present of a leveret was sent them, they made it serve two dinners for four people. The sculptor grew more generous before death, his parsimonious partner having gone first, as though he strove by sundry spasmodic gifts to atone for the avarice of a life. If these details are as unsavoury to some as to ourselves, we only justify their narration on the ground stated, that the qualities they set forth were found existing in a genius.

Did time permit we should like to linger over these notable eccentrics, Porson, Horne Tooke, Peter Pindar (Dr Wolcot), and others; but we can only give a characteristic anecdote or two. Porson, the cleverest and most erratic of creatures, was the victim of abstraction to an extent that rendered him forgetful at times to eat. 'Will you not stay and dine,' asked Rogers the poet. 'Thank you; no; I dined *yesterday*!' he replied. Dr Parr asked him before a large assembly what he thought about the introduction of moral and physical evil into the world. 'Why, doctor,' said Porson, 'I think we should have done very well without them.' And it makes us laugh to hear an ignorant person, who was anxious to get into conversation with him, ask, if Captain Cook was killed in his *first* voyage. 'I believe he was,' answers Porson; 'though he did not mind it much, but immediately entered on a second!'

Tooke began life with a joke, telling every one that he was the son of a Turkey merchant; by which name he defined his father's trade of poulterer. His ready wit was never at a loss; and it is to him we are indebted for the following well-known joke. 'Now, young man,' said an uncle to him one day, giving him good advice, 'as you are settled in town I would advise you to take a wife.' 'With all my heart, sir,' replied Tooke: 'whose wife shall I take?'

Peter Pindar boasted that he was the only man that ever outwitted a publisher. Being a popular writer, his works brought him a good income. His publisher wishing to purchase the copyright and print a collected edition, made him an offer in cash. In order, however, to drive a good bargain, Pindar feigned to be in very bad health, declaring he could not live long; and every time the publisher came to see him he acted the invalid to such perfection that he got a handsome annuity, which, to the disgust of the publisher, he lived to enjoy until the unconscionable age of eighty-one.

We leave a number of our eccentric friends with regret. There was Curtius, whom we do not care to accompany in his search after the horrible and his passion for convicts and executions. There was Dr Fordyce, whose eccentricity in the matter of food is a study; he lived for years on one meal a day only, but a meal so enormous that we wonder, as we read the quantities, how he ever lived to repeat it daily for twenty years. We can only

now recommend those who have been interested so far, to supply our deficiencies by going to the source from whence we have gathered the matter for this brief notice.

SNAKE-INCUBATION.

THE Zoological Gardens of London, always attractive, now and then acquire even additional interest by the arrival of some new inmate, or the occurrence of some rare event among those already established there. Last year the Prince of Wales's Indian collection of animals, the year before the snake-eating snake, drew extra crowds; and of late the anaconda from Brazil has rendered herself popular by bringing forth a family of snakelings; though, owing to the effects of her long journey and close imprisonment, her young ones were dead. A few years ago the largest snake in the Gardens was an African python, that deposited above one hundred eggs in a nest of moss which had been supplied to her; and as some writers about snakes had told us that the python incubates her eggs, and that only this kind exhibits any such maternal instinct, she also drew crowds of the curious.

The pythoness whose proceedings we are about to relate, having deposited her eggs, arranged them in a level mass and then coiled herself around and over them; sometimes they could be just discovered between her coils, and sometimes she covered them entirely. Heat combined with moisture are essential to the development of snakes' eggs; and in the choice of a spot in which to deposit them, the maternal instinct of the animal in a state of freedom is evident. It is generally among decaying vegetation where heat is generated, or in some moist soft herbage where the sun's rays can penetrate. To regulate the temperature in a close cage and keep the moss precisely in a condition to suit snake requirements, was by no means easy, and our pythoness seemed far from satisfied. The fact, however, was established beyond doubt, that she was hatching her eggs by the warmth of her own body.

But a most untoward disaster happened one night in the overflowing of the tank among her eggs, completely saturating them; and it was not surprising therefore, that no young pythons appeared. The enormous reptile remained coiled around and over her addled eggs for above seven weeks, after which they were taken from her. She had, and with good reason, been exceedingly irritable and even savage during this time of trial, as it was mid-winter, the season when under other circumstances she, like her companions, would have been half torpid. But her maternal affection was undeniable, and this alone was worth witnessing; since some authors would have had us believe that snakes (and particularly non-venomous ones) manifest entire indifference regarding their eggs and young. The python's eggs being, as usual, in one long string, the keeper had no little trouble in getting them from under her.

Being aquatic in their habits, and on that account requiring much water, anacondas are difficult to keep in captivity. The one lately arrived among us was no sooner released from its travelling box than it took to the tank with which its cage is furnished, and remained in it

for hours and even days together. But not there, poor thing, can its swimming powers be displayed, since in close coils it completely fills it. Notwithstanding these drawbacks of London life, the Gardens can now boast of three of these valuable snakes; one of which has been a resident since 1869; while those in Paris have not survived any length of time.

One still more remarkable characteristic of the anaconda is that, like the sea-snakes (*Hydrophidae*), but unlike the python, it produces its young alive. We have long been accustomed to think that only vipers produce live young—and hence their name—and that all the non-venomous snakes lay eggs. But snakes, so far as those in captivity are concerned, are continually doing what is not expected of them. Zoological Gardens afford valuable opportunities to students for acquiring knowledge of the form, size, habits, &c. of animals, and an occasional insight into their modes of life unattainable otherwise. This is especially the case regarding the Ophidians; creatures which in their native haunts are so retiring, inaccessible, and mostly nocturnal, that less has been known of them than of almost any other tribe of creatures. Regarding the subject in question, several very important zoological facts have recently been established at the Gardens, and we may add, to the surprise of the naturalist world in England. In 1862 (the same year in which the pythoress laid her hundred eggs), the then but slightly known non-venomous English snake *Coronella levis* gave birth to a family of six live young ones in a cage in London; and several other harmless snakes in the London ophidarium have also afforded cause for surprise, not only in producing live young, but in manifesting a very decided care for them. Some New-world species have been examples of this; as, for instance, the 'garter-snake,' the 'chicken-snake,' and the 'yellow boa' of Jamaica (*Chilobothrus inornatus*), the latter on several occasions, and sometimes depositing eggs at the same time, but the eggs proving bad.

Mr Philip Henry Gosse, when in Jamaica nearly thirty years ago, gave much careful attention to the habits of this 'yellow boa,' a snake which sometimes attains eight or ten feet in length and is extremely active. He records a great deal of highly interesting matter concerning the *chilobothrus*; and, as a careful and conscientious observer, his testimony is of much value. That this snake when at liberty lays eggs, was well known, nests with eggs in them being often found. In one case a 'yellow boa' was seen issuing from a narrow passage in a bank, which when dug into was found to lead to a cavity lined with leaves and soft trash, and containing eggs. This hole had been excavated, because the dry crumbled earth was discharged at the entrance, where it lay in a heap. The passage was only just large enough to admit the snake, and the soft rubbish within must have been carried there. We cannot positively assert that the snake constructed this skilful hiding-place for herself, but if she did, she must have forced out the earth as the burrowing snakes do, or by the muscular undulations of her body; and she must have conveyed the leaves there in her mouth. Snakes do, we know, sometimes make nests by coiling themselves round and round to form a hollow. Under either circumstance maternal

instinct is undeniable; and if *chilobothrus* merely discovered and appropriated the nest of some other creature, her intelligence is still worth recording.

We knew an instance where a snake in captivity exhibited restlessness and uneasiness, crawling about the cage as if in search of something. Those who had the care of it suspected she was with eggs, and placed some sand in the cage. This appeared to satisfy her, and the eggs were deposited. Mr Gosse had a Jamaica boa in the same condition. For a long time it manifested discomfort and restlessness, being savage and in every way objectionable, till at length it produced a family of young ones. Knowing it was the habit of this snake to incubate its eggs, Mr Gosse was greatly surprised at the event; and the startling question occurred to him, that when circumstances are unfavourable for the deposition of eggs, could a snake retain them until the young are hatched?

Mr Gosse's surmises have been entirely confirmed both by similar occurrences at the Zoological Gardens and by other writers, who in the subsequent interval have also given careful attention to the habits of Ophidians, and have produced valuable scientific works on the subject. It is now an ascertained fact that not *chilobothrus* only but several other oviparous species may at pleasure be rendered viviparous by retarding the deposition of their eggs when circumstances are unfavourable for them! In fact we find that we must almost discard those old distinctions of *oviparous*, *viviparous*, and *ovoviviparous*; which German authors tell us are not founded on any other ground than a greater or less development of the fetus in the egg at the time of laying; or on the nature of the exterior covering of the egg; which is thicker and leathery in those which take some time in hatching, and slighter and membranous in those which are hatched either before or on deposition.

In serpents the eggs differ from those of birds by undergoing a sort of incubation from the very first, so that whenever examined, the embryo more or less advanced will be found. In the case of the pythoress of 1862, an egg was examined on the fifteenth day of incubation, and found to contain a living embryo; a noteworthy fact, as the python incubates for fifty-six days before hatching her eggs. Observations with the eggs of *chilobothrus* are attended by the same results—namely the fetus in a certain stage of development is discovered whenever a gravid snake is killed and examined. The young ones of the boa in the London collection were perfectly developed and active, climbing all over their cage as soon as they saw daylight. One family consisted of thirty-three; another of eight; and another of fourteen. The activity and daring of the snake-lings were amazing, affording ample proof of their perfect development. They were always on the defensive, shewing fight on the slightest molestation. When the keeper put his hand into the nest among them they seized upon it and held on so tightly with their teeth, that on raising his hand they hung to it, wriggling and undulating like a waving golden tassel. I ventured to take up one of these aggressive little reptiles, but could scarcely hold it, from its energetic wriggings and contortions. It constricted my fingers tightly enough to prove its singular instincts, and bit me savagely with its sharp little teeth; but my glove being on,

I permitted this, glad of so good an opportunity for making personal observations.

It was said of the python that notwithstanding her care and vigilance so long as she was incubating, when her snakelings were born she took no notice of them. This may not always be the case. Vipers we know are extremely watchful over their young; other snakes are often seen accompanied by a young brood; and in the Jamaica boa maternal affection is exhibited in no slight degree. A lady visiting the Gardens compassionated one of these young families on the gravelly floor of their cage, and brought a quantity of cotton wool, which was placed in one corner. She was rewarded by seeing the luxury fully appreciated, mother and little ones all huddling into it immediately.

That these non-venomous snakes thus produce their young under *abnormal* conditions is further confirmed by the varying size and appearance of the offspring, and by their being more or less enveloped in the shell-covering. Some are born quite coiled in the ruptured shell, others with portions of it clinging about them, and others again entirely free. Sometimes they are, as it were, imbedded in the coriaceous covering. This was conspicuously the case with the anaconda's progeny, but her young ones had every appearance of having been a long while dead. The first of the six was freer from the shell than the others, and about a foot and a half in length.

Snake-life is altogether marvellous. The power which some snake mothers possess of retarding the deposition of their eggs, and we have reason to believe, sometimes even the young when circumstances are unpropitious for her to produce them, seems to us specially curious. *Chilobothrus* is known to have had both eggs and a living brood. So has *Coronella levis*. Of the latter, some German ophiologists state that it is 'always viviparous'; others 'occasionally' so. In her native Hampshire woods she has been seen with a young brood about her; but there seems no satisfactory evidence of any eggs having been found. Time and careful notings only can substantiate this and many other singular facts regarding these 'wise' and 'subtle' creatures, hitherto surrounded by prejudice and but little studied. We, not well versed in Ophidian biographies, might have expected the anaconda to lay eggs because her cousin the pythoness did so; and we might have also speculated upon her incubating them, as the python did. But she has produced a perfectly developed though dead family of six, instead; a circumstance of so much interest to naturalists, that the loss of the young ones is to be regretted though not wondered at. Captured from her native lagoons, and shut out from the light of day in a box just large enough to contain her, this 'good swimmer' arrives alive; thus proving her amazing powers of endurance; but she has had no fitting place in which to deposit her young, and they died unborn. Still it is a noteworthy fact in the annals of zoology. At first, from the result of observation, the incubation of the python was 'suspected'; then it became confirmed; and the birth of young coronellas also. From this it is evident that we cease to declare that only *vipers* produce live young; or, according to the original signification of the word, a boa, a coronella, and several other non-venomous snakes would be '*vipers*!'

Again, it is remarkable that these peculiarities of reproduction are not confined to particular families and genera; because some coronellas lay eggs, some incubate them, and others bring forth a live brood. So also, while some of the *Boaidæ* lay eggs, the anaconda is completely viviparous.

We would venture to urge upon those lovers of nature who dwell 'remote from towns' the value of careful observation and a noting down of what appears unusual, even of the habits of the much persecuted snake.

C. H.

PLAYTIME AT OXFORD.

'WHAT is to be done this afternoon?' is a question invariably asked by scores of undergraduates, either at the well-supplied breakfast-table (for whatever men do not learn at Oxford, they at least learn to eat a good breakfast), or by those victims of procrastination who leave everything to the last moment, just as the scout is bringing up the more modest luncheon.

There are certain rules at the university—social rules I mean—which, though unwritten, are not to be broken save under severe penalties, such as being entered among that class of undergraduates yelegt 'smugs.' Of these unwritten laws, one of the best and most universal enacts, that a great part of the afternoon shall be spent outside the college, presumably in active and healthy exercise, even if it be but a sharp constitutional. Not that this is a hardship, or that the answers to the question, 'What's to be done?' and the modes of spending these two or three hours, are monotonous or circumscribed. Far from it. Many places may be more full of life and amusement than Oxford in the morning and evening; but few, I am sure, can surpass the bill of amusement which Alma Mater presents to us after lunch.

Every taste can find appropriate satisfaction, save perhaps the taste for picturesque scenery, in which the neighbourhood of Oxford, to use a 'varsity term, 'does not come out strong.' Still, if I may believe report (never believe an undergraduate when he tells you a tale of a fellow he knew), Cambridge is rather worse off. We have Shotover and Bagley Wood to set against their Gog Magog Hills. Be that as it may, simple walking does not find many advocates, except on Sunday, or as a stop-gap on some off-day when rackets and the river begin to pall, as every amusement seems to do by the end of term. I have even heard a member of an eight-oar say after six weeks' daily attendance at the river, that 'he really felt he'd had almost enough of it.' And it is rather an objection to rowing, that as soon as your blisters have hardened and you feel indifferent about the cushion on your chair, the act of pulling your own weight and a trifle over begins to have a certain sameness.

To return to walking. Much of that otherwise tame exercise is involved in going to witness sports of various kinds. Almost every day in winter there is either a football match or a racket match, or the trial eights or some college sports to be inspected; or we may look in at the fives-courts or at the gymnasium, and see Tompkins vaulting the high-horse, which he does not do so well as at lunch; or to the dog-fancier's in — Street, and look over Jenkins's bull-pup. Not that there is

any rattling going on of course, or such a thing as a badger in the county; but these are lazy ways of getting through the time, and except occasionally, none of our party is reduced to them. No; for Brown votes for rackets: a game active enough, I can vouch. It looks so easy to hit the ball with the great battledore-shaped racket—until you try: perhaps as easy as battledore and shuttlecock, now ousted by lawn-tennis. So just descend into the black-lined arena, and you will discover that the small sphere you aim at finds out all sorts of impossible angles, and dodges you in a way that no fellow can stand; so that rackets is rather dispiriting to a beginner. Having only once got up the ball in the course of an hour, and having sharply struck myself on the side of the head with my own racket, to say nothing of the curious attraction of the ball to my shoulder-blades, I determined that that should be my last as well as first visit to a racket court, charming as the game doubtless is when well played. So Brown will not ask me to make up his four for Holywell. There are also one or two tennis courts in Oxford; but I do not think that the favourite game of the Merry Monarch is very generally played except on grass.

I shall not part from Brown yet, but shall accompany him to Holywell and get a hand in the fives-court. It is a hot game, but not a graceful one, like rackets. It is all very well to poise your racket overhead, sway backwards and send the whizzing ball against the wall. But it is quite another thing to flounder after it with outstretched hands, which seem monstrous in their hot clumsy gloves, and missing it by a hair's-breadth, 'vainly beat the air.' Say what you like against it, there is no better exercise, though I should not think of bringing a certain young lady to witness my performances there, any more than I should of asking her to come to hear me viva-voce'd in the schools.

But I have wandered from the subject to the fair sex. To return to Jones, who is going to scull as far as Sandford in the fairy outrigger in which he is proud to disport himself. With some reason too, for the equal dip of the sculls in an outrigger skiff is hard to attain, and the art of turning those craft in any reasonable space is known only to a few of the initiated. I have always found that when I steered 'by the bank,'

E'en for a calm unfit,

I'd steer too near the sands to boast my wit,

as Dryden says; though I am not quite sure that he exactly means that. Others of our luncheon-party are bound by college patriotism to go down to the barges and undergo their day's training for the Torpids. These are of the stalwart sort; but they will not have a very pleasant time of it, nor will Jones in his skiff, for the wind is rather strong, and the water even on the lower river must be pretty rough; so two of our company, not of the stalwart kind, are going to the Freshman's river to engage one of those sailing-vessels called at Oxford a 'centre-board.' The wind is blowing fairly up stream; but they will have some trouble at a certain corner called 'Blackjack;' and I shall not be surprised if their new flannels are somewhat shrunken by to-morrow. Still they can swim; and if they can't, they ought to.

Besides the Rugby votaries of football, the Association and other clubs play in the parks. The

practice of the former is the most interesting to watch; and though this pastime is, not without some reason, deemed by many to be silly and even barbarous, it seems to be generally largely patronised by spectators.

We must not neglect the new running ground with its comfortable pavilion, where, if we do not wish to take a trot ourselves, we may read *The Field*, and watch through the window the training of the crack whose performances it records. And talking of running, there is or was a Hare and Hounds Club, which numbered some distinguished runners among its members; and one college at least had lately, and perhaps still has, a pack of beagles. If a man be of very solitary habits and much inclined to hide him from his kind, there is jack-fishing in many parts of the river, engaged in which contemplative recreation he may moralise to his heart's content. There is a Gun-club too; to say nothing of the hunters, hacks, and pony-carts which may be obtained for a consideration. I don't know whether the hunters are screws, for I've never tried one, and for the same reason I don't know whether they are dear or cheap; on the whole, however, I should be inclined to say *not* cheap. Then there is a bicycling club, whose members perform immense distances in wonderful times, and who talk of going to Aylesbury or to Banbury and back, as outsiders do of Cowley and Cuddesden. And if you are one of the country's defenders, are there not drills in St John's Gardens, or parades in the Broad, and evolutions of all kinds in the parks? harder work than the road-making lately fashionable at Hinksey, near which, I believe, are the rifle butts. Playing at labourers has gone out, I believe.

But the summer term is the term for fun. Woful is the man who is in the schools in the bright days of June, when the sun at length gets through the Oxford fogs. The summer term is, technically speaking, two terms, for there are four terms in the 'varsity year, though no 'varsity man ever yet knew the distinctive names of them; and so the summer terms are twice as jolly as the other two, though only equal to one in length. Ah me! I shall soon have cause to sigh for the days that are no more. Then cricket and lawn-tennis, the eight-oar races, the lazy punt and nimbler canoe, cider-cup and skittles at Godstow, bathing at Parsons, archery and croquet, and cousins and sisters, and the occasional flower-show, will recur amongst the standing-orders of the past!

Every afternoon, when it is fine, the cricket-grounds, most of which are at Cowley, present a lively scene. The practising nets are occupied by batsmen, the sound of whose strokes on the much-enduring leather is like the tap, tap, tapping at the hollow beech-tree, or at the garden-gate, according to the taste of the listener. If you go in front of the nets, keep your eyes and ears open, or you may get knocked down by a stray ball—a danger kept constantly in your mind by frequent cries of 'Head!' which cause many to anticipate the bump in store for one. A man does not look to advantage at the moment when he becomes conscious of a descending cricket-ball in close proximity to the back of his head. In the centre of the ground a college match is being played; and in the tiny structure often graced by the title of

Pavilion much beer is being consumed. At the further end, a couple of games of lawn-tennis are being briskly kept up. Altogether, the college ground is not a bad place in which to spend the afternoon, even though you may not be Al at cricket.

As to the river, every visitor to Oxford in the summer term has seen that, and its varied and variegated load of eight-oars, four-oars, dingies, whiffs, skiffs, cockle-shells, pairs, punts, and coal-barges. For my own part I prefer the Cherwell and the cushioned punt. It is not a bad plan to get on shore in the Botanical Gardens, and stroll up the High as far as Cooper's, wherein to consume strawberry ices. I do not much affect the archery and croquet, nor yet the flower-shows; very good in their way, I daresay, but you can enjoy them at home, where a racket court, or even a skiff, is not always handy, and where skittles are apt to be voted low, and the secrets of cider-cup hidden from the butler's ken. So make your hay while the sun shines. And almost as fast as the skittles fall before the practised hurler, fly the nine weeks of the summer term, which comes to most men but three times in their lives; and if enjoyed again, must be so generally only at the expense of a disastrous 'plough,' a catastrophe which necessitates extra reading and perhaps a change of residence.

So the curtain falls upon the glories of the final tableau, the Commemoration, a tableau which has sadly wanted its proper amount of blue-fire lately. Even the Long Walk is beginning to fail as an avenue, and there are some gaps in the foliage, I think. All work and no play makes Jack a dull boy: but even though he *does* work, and 'reads' when he ought, Jack need not be dull withal at dear old Oxford.

THE MONTH:

SCIENCE AND ARTS.

THE President of the Royal Society is travelling in America, studying, in company with Professor Asa Gray, the peculiar vegetation at the foot of the Rocky Mountains—while Dr Tyndall is solacing himself with a quiet holiday in his own house on the Bel Alp—while spectroscopists are rejoicing in the new 'grating' constructed by Professor Rutherford, which multiplies to an extraordinary degree their power of observation—while physicists and naturalists are betaking themselves to inland villages or to remote bays on the sea—while amateurs are looking at the one hundred and seven photographs of the Arctic expedition recently published by the Admiralty—while artists, engravers, and printers are at work on the voyage of the *Challenger*—while readers are acquainting themselves with Mr Darwin's new book, *The Different Forms of Flowers on Plants of the same Species*—while the British Association are reckoning up the profit and loss of their meeting at Plymouth—while the promoters of the Ordnance Survey of Palestine are appealing for funds to finish their work—while geographers and adventurers are soliciting means for the exploration of Africa—while Europe is trying to prevent immigration of the Colorado beetle—while Mr Varley is attempting by telephone to carry music from Her Majesty's Theatre to the 'other side of the water'—while

the Treasury are considering whether they will ask parliament to vote three million pounds for the building of the much wanted new public offices—while Mr Berthollet is pointing out 'the possibility of producing temperatures really approaching three thousand degrees'—while Mr Rarchaert is shewing that his locomotive, combining the two essentials of adherence and flexibility, will travel safely round curves of two hundred and fifty metres radius—while Mr Cornet, chief engineer of mines in Belgium, is endeavouring to prove that compressed air can be used in mines; and while the Social Science Council are settling their programme for amendment of law, repression of crime, promotion of education, improvement of health, furtherance of economy and trade, and diffusion of art—while all this is going on, science, art, and philosophy progress in a way that implies force within as well as without.

Where steam is employed, especially on board ship, it not unfrequently happens that a sudden occasion arises for exercise of the utmost power of the engines, and that to this gain extreme power for the short time required is of more importance than economy of coal. The method hitherto adopted to effect this object is to drive more air through the fire, or to throw a jet of steam into the chimney.

Mr Bertin, a French marine engineer, has proved that the best method is to throw jets of slightly compressed air into the base of the chimney by means of a centrifugal ventilator, or at higher pressure by employing a blowing-machine working with a piston. Under the transitory action of these jets of air the combustion in the furnace is doubled, and the ship, like a warrior in extremity, may make efforts impossible in ordinary circumstances. The increase in the consumption of coal is not more than twenty per cent, and the method having been tried on board one of the national frigates, *La Résolue*, has proved so effectual, that its adoption is only a question of time. Mr Bertin has described his method and the principles on which it is based in a paper to be published in the *Bulletin* of the Société d'Encouragement pour l'Industrie Nationale.

The same Society have just recognised the merits of an English chemist, Mr Walter Weldon, by conferring on him their Lavoisier medal—*grande médaille d'honneur*—for his discoveries and improvements in the art of manufacturing chlorine. Formerly all the manganese used in the process was wasted, and manganese became scarcer and dearer. Waste is an opprobrium in chemical operations. Mr Weldon shewed a way by which the manganese could be reoxydised over and over again indefinitely; and at once an offensive part of the process was got rid of, and the price of chlorine fell thirty per cent. This of course cheapened all the articles, and they are numerous, in the production of which chlorine plays a part; and Mr Weldon's method has been adopted wherever chemicals are manufactured on a great scale. Mr Lamy, who drew up the statement of the grounds on which the medal was awarded, said: 'If we have not the good fortune to designate a Frenchman for your suffrages, at least we have the satisfaction to present an inventor belonging to a friendly nation, the first among all for the development and the potency of its chemical industry.'

If this be true, there is a chance for another ingenious chemist for the Council General of

Guadeloupe offer a reward of one hundred thousand francs to the inventor of a new method of extracting the juice of the sugar-cane, or of manufacturing sugar.

Hitherto it has been thought that to produce a good black dye the co-operation of a metallic substance or of a chlorate, or both combined, was indispensable. The question arose: Were those ingredients really indispensable? Mr Rosenstiehl first shewed that the metal might be dispensed with, and recently, as may be seen in the *Annales de Chimie et de Physique*, Mr Coquillion has proved that the chlorate is not required, for in the one case as in the other, the use of 'nascent' or active oxygen will effect the desired object. We are informed that the fact observed by the French chemist 'is an elegant demonstration of the action of active oxygen upon aniline salts; that it will perhaps enable us to obtain blacks derived from aniline in a state of greater purity, and to hasten the moment when we shall know their elementary composition; a question which, in view of its great interest, has been proposed for a prize by the Industrial Society of Mulhausen.'

Mr Cornet, whose name has been mentioned above, in a mathematical discussion of the question, says that compressed air would be largely used in mining operations 'were it possible to keep the temperature of the air from rising during compression much above that of the atmosphere, and from falling during expansion to the temperature of freezing water.' And he thinks that he has found 'the means for attaining this end in the use of water-spray, which could be introduced into the cylinder of the compressor, and into that of the machine using the air in the mine.' The practical details are not yet made known; but if they succeed, 'the use of compressed air in mines will soon become general, and the problem of mining at any depth will be solved.'

One part of the method devised by Mr Cornet had been previously thought of; for in 1875 an air-compressor was working in the St Gothard tunnel, of which it was said: 'The heat produced by compression is reduced by the circulation of cold water in the walls of the cylinder, in the interior of the piston and its rod; and an injection of water-spray at the two extremities of the cylinder completes the cooling.' When the compressors were at work they supplied to the tunnel fifteen cubic metres of air per minute.

When messages were first sent by telegraph, many persons were exceedingly puzzled to understand how they were sent; and now the telephone has come to disturb them with another puzzle. But scientific men have long known that 'galvanic music,' as it is called, was discovered forty years ago, that an electro-magnet on being suddenly magnetised or demagnetised gives out audible sounds, and that many notices of the curious fact were printed in English and foreign journals. Professor Graham Bell, whose experiments have been already mentioned in these pages (*ante* 208, 416), succeeded in making the sounds, which were commonly very faint, audible to a large number of persons. This was accomplished, as he explains, 'by interposing a tense membrane between the electro-magnet and its armature. The armature in this case consisted of a piece of clock-spring glued to the membrane. This form of apparatus,' he continues, 'I have found invaluable in all my

experiments. The instrument was connected with a parlour organ, the reeds of which were so arranged as to open and close the circuit during their vibration. When the organ was played, the music was loudly reproduced by the telephonic receiver in a distant room. When chords were played upon the organ, the various notes composing the chords were emitted simultaneously by the armature of the receiver.'

'The simultaneous production of musical notes of different pitch by the electric current,' continues Professor Bell, 'was foreseen by me as early as 1870, and demonstrated during the year 1872. Elisha Gray of Chicago, and Paul La Cour of Copenhagen, lay claim to the same discovery. The fact that sounds of different pitch can be simultaneously produced upon any part of a telegraphic circuit is of great practical importance; for the duration of a musical note can be made to signify the dot or dash of the Morse alphabet; and thus a number of telegraphic messages may be sent simultaneously over the same wire without confusion, by making signals of a definite pitch for each message.'

By instalments of news from the Pacific we hear of the tremendous earthquake that occurred last May; but for precise details we shall have to wait until reports are published in the scientific journals of the United States. Meanwhile, we learn that the great volcano of Kilanea in Hawaii began to be restless on the first of the month; a few days later huge columns of lava were thrown up, vehement jets of steam burst forth from a long range of fissures, and all the startling phenomena of a mighty eruption, including drifts of Pele's hair, were observed. This evidence of disturbance deep down in the earth was corroborated by an earthquake, which about half-past eight on the evening of the 9th terrified and devastated the coast of Peru, and occasioned greater ruin than the similar calamity in 1868. Iquique is said to be completely destroyed, and other towns and cities along two hundred miles of coast suffered more or less severely. As usual, the commotion of the land produced a commotion of the water, and the sea rolling great waves upon the shore, intensified the havoc. The waves varied in height from ten to sixty feet; and we are told that 'four miles of the embankment of the railway were swept away;' and that 'locomotives, cars, and rails were hurled about by the sea like so many playthings.'

Also, as is usual in such catastrophes, the earthquake wave was propagated; and between four and five of the morning of the 10th, it (that is the sea) rushed upon the Hawaiian Islands in waves varying from three to thirty-six feet in height. Thus in eight hours the resistless oscillation had traversed the five thousand miles which separate the islands from the South American continent.

From this brief sketch it is obvious that there is much in this calamitous visitation to interest the physicist and geologist as well as the philanthropist. Information will in all probability be communicated from other places until the remotest points at which the disturbance was felt shall have been ascertained.

As relating to this subject we remark that the hair of Pele—a Hawaiian goddess—above mentioned can be produced artificially in a blast furnace. It has been described in former pages of this *Journal* as 'slag cotton.'

We learn by a communication from Hawaii to the American Journal of Science and Arts that a grand outburst occurred in February last, but ceased quite suddenly, to the disappointment of visitors who came expecting to see a volcanic display. As the vessel was steaming away, they saw in deep water, a mile off Kealakekua, the place where Captain Cook was killed, a remarkable heaving and bubbling, intermingled with jets of steam, and throwing up of pumice and light scoria. This commotion was still going on five weeks afterwards. It was occasioned by a subterranean lava-stream which, after rending the mountain slopes with deep fissures, found an outlet under the sea.

The Weather Review published by the United States Signal Service contains details of the wave which may be accepted as trustworthy. 'About 8.50 P.M. of May 9, heavy earthquake shocks were felt over the region between Arica and Mexillones (border of Peru and Bolivia). The oceanic wave which immediately followed was of great violence along the adjoining South American coast, and was felt also as far north as California, the rise at Anaheim being twelve feet in a few minutes. At Callao, Peru, the wave was felt at 11 P.M.; at San Francisco was perceptible at 6.18 A.M. May 10, with increase to a maximum of fourteen inches at 8.20. It reached the Sandwich Islands, eastern Hawaii, at Hilo, at 4 A.M.; and the great wave, thirty-six feet high, came in at 4.45. At Honolulu it was first felt at 4.45, and was followed by the great wave at five o'clock.'

In a subsequent communication it is stated that thirty-six hours after the inrush of the great wave at Hilo, the rising and falling still continued, 'the incoming and outflowing wave occupying about an hour, the latter leaving the channels nearly bare.'

Our American cousins are not disposed to accept their plague of locusts as an inevitable calamity, for the Entomological Commission appointed by the government at Washington have published two numbers of a *Bulletin*, with woodcuts, giving information on the natural history of the devouring insects and on the various methods proposed for their destruction. It is shewn that by systematic endeavours before the creatures get their wings they may be destroyed on a great scale, for then it is possible to drive them in enormous 'schools' or flocks as easily as sheep. Millions fall into long straight ditches dug as traps and there perish; millions more are crushed by rollers; hogs and poultry devour them greedily; and a number of ingenious machines stand ready to catch the winged locusts in the air or to capture them as they crawl. One of these machines produces a powerful upward blast which sucks up the crawlers from the ground, and drives them into a receptacle where they are smashed to a pulp. American ingenuity is roused by the swarming inroad, and it will be interesting to watch the struggle. Meanwhile the States adjacent to the Rocky Mountains are anxiously asking which is to conquer, man or locust?

Concerning the Colorado beetle, Mr Riley, State Entomologist for Missouri, reports that the eastward progress of the insect 'was at the average rate of eighty-eight miles a year, and that it has now invaded nearly a million and a half square miles, or more than one-third the area of the United States. It does not thrive where the ther-

mometer reaches one hundred degrees Fahrenheit, and hence it may never extend its range very far south of the territory now occupied; but its northern spread is not limited; and it may push to the northernmost limit of the potato-growing country.'

Special associations for special objects are a characteristic of the present century, so it seems quite natural that there should be a 'Society of Americanists,' whose object is to gather information about America. They meet once in two years; their next meeting is to be held next month at Luxemburg; and we learn from their programme that their inquiries are to apply to the times anterior to the discovery of America by Columbus. Thus the picture-writing of the Mexicans, their civil legislation under the Aztecs as compared with that of the Peruvians under the Incas; the inscriptions in the ancient cities of Central America, the ancient use of copper, the works of the mysterious mound-builders, the comparison of the Eskimo language with the languages of Southern America; traditions of the Deluge especially in Mexico; the discovery of Brazil, and other ethnographical and palæographical subjects. If this scheme be wisely and diligently followed out, there is reason to hope that some light will be thrown into the obscurity of early American history.

A description of the great river Amazons and of the vast region watered by its affluents, by Mr R. Reyes, is published in the *Bulletin* of the Société de Géographie, at Paris. He calls it the American Mediterranean, and shews that by itself and its feeders, the noble stream borders the territories of Bolivia, Peru, Ecuador, Colombia, Venezuela, and Brazil. Ships of the largest class can navigate to a distance of three thousand miles from the sea, and ascend some of the tributaries from two to nine hundred miles, through a country rich and fertile almost beyond description. The forests produce four hundred different kinds of wood, mostly of excellent quality, as may be seen in the Museum at Rio Janeiro; and fruits, drugs, and minerals abound.

A tourist wishful to take a holiday in the tropics may now embark in the West Indies, cross to the mainland, steam up the Magdalena to the city of Purification in the Colombian State Tolima. Thence by a land-journey of three days he reaches the steamers on the affluents of the Amazons, and ends his voyage of four thousand miles on the great Brazilian river.

TO THE READERS OF CHAMBERS'S JOURNAL.

Next month will be commenced a Romance, in Three Parts, by 'ALASTER GRAEME,' entitled

FROM DAWN TO SUNSET,

to run through several months of this *Journal*.

In January 1878 will appear the first chapters of a Novel, by JOHN BERWICK HARWOOD, entitled

HELENA, LADY HARROWGATE.

Encouraged by the still increasing popularity of *Chambers's Journal*, the Conductors will spare no effort to maintain its attractiveness.

Printed and Published by W. & E. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

TREATMENT OF ANIMALS.

IN our youthful days in the early years of the present century, little consideration was given to a systematic kindness to animals. Horses were overwrought without mercy, when ill-fed and with wounds which should have excited compassion. If they sunk down in their misery, they were left to die, the chances being that, in their last hours, they were inhumanly pelted with stones by boys;—no one, not even magistrates or clergymen, giving any concern to the cruelties that were perpetrated. All that we have seen, without exciting a word of remonstrance. A wretch who habitually turned out his old, overwrought, and half-starved horses to die on the town-green, never incurred any check or reprobation. His proceedings were viewed with perfect indifference. People, while passing along in a demure sort of way to church, would see a crowd of boys pitching stones into the wounds of a dying horse, and not one of these decorous church-goers endeavoured to stop these horrid acts of inhumanity. Like the Pharisees of old, they passed on the other side. Such within recollection is a small sample of the unchecked atrocities of our young days. Cats were pelted to death. Birds' nests were robbed. Dogs had kettles tied to their tail, and were hounded to madness by howling multitudes. Oxen were overdriven to an infuriated condition, and their frantic and revengeful career formed an acceptable subject of public amusement.

Barbarous in a certain sense as these comparatively recent times were, there had already been shewn instances of a kind consideration for animals. The poet Cowper, it will be recollected, wrote touchingly of the hares which he had domesticated. Sir Walter Scott's tender regard for his dogs has been recently noticed in these pages. There was here and there a glimmering consciousness that animals had some sort of claims on the mercy of mankind. What strikes one as curious is that society had retrograded in this respect. The oldest laws in the world, found in the early books of the Old Testament,

enjoin a kind treatment of animals. If we see an ass fall which belongs to some one with whom we have a cause of difference, we are to throw aside private feelings, and hasten to help the animal. We are not to take a bird when sitting on its eggs, or on its young; a most humane injunction. In various texts the Hebrews were enjoined to have due regard for the comfort of the ox, the ass, or any other animal which laboured for them. In these venerable records, mercy is enjoined towards all living creatures.

The modern world, with all its pompous claims to civilisation, strangely drifted into an entire neglect of these beneficent obligations. Throughout Christendom, any laws enforcing a kind treatment of animals are few in number, and of very recent date. Even within our remembrance, clergymen were not usually in the habit of inculcating that species of kindness to domesticated creatures which we read of in the Old Testament; nor were children ordinarily taught lessons of humanity within the family circle. The oldest statutory laws concerning animals are those for the protection of game; but these laws proceeded on no principle of kindness. They were intended only to protect certain birds and quadrupeds during the breeding season, with a view to what is called 'sport,' the pleasure of killing them by licensed individuals—the license for indulging in this species of luxury being, as is well known, pretty costly. It is not our wish to hold up 'sport' of a legitimate kind to ridicule. The chief matter of regret is the coarse way in which game is sometimes pursued and killed even by licensed sportsmen: their operations in what is known as a *battue*, when vast numbers of animals are driven into narrow spaces, and shot down and maimed without mercy, being, as we think, no better than wholesale butchery; and not what might be expected from persons of taste and education.

Although in the early years of the present century there were no laws for the specific purpose of preventing cruelty to animals, thoughtful and humane persons were beginning to give attention to the subject. In 1809, Sir Charles

Bunbury brought into the House of Commons a bill for the 'Prevention of wanton and malicious cruelty to Animals.' Mr Windham, a cabinet minister, little to his credit, opposed the bill, and it failed to pass. The next attempt at legislation on the subject was made by Lord Erskine in the House of Lords in 1810. His measure was opposed by Lord Ellenborough, and had to be withdrawn. There the matter rested until 1821, when Mr Richard Martin, member of parliament for Galway, brought a bill into the House of Commons for the 'Prevention of Cruelty to Horses.' It encountered torrents of ridicule, and after passing a second reading in a thin house, was no further proceeded with. Mr Martin, however, was not discouraged. He felt he was right, and returned to the encounter. In 1822, he introduced a new and more comprehensive bill. Instead of horses, he used the word 'cattle'; this bill passed through all its stages, and became an act of parliament. This act of 1822 was the first ever enacted against cruel and improper treatment of animals. Let there be every honour to the memory of Richard Martin for his noble struggle on behalf of defenceless creatures. In 1825, he brought in a bill for the suppression of bear-baiting and other cruel sports. Not without surprise do we learn that Sir Robert Peel met the bill with determined opposition, and that it was thrown out. To think that so eminent a statesman as Peel should have been a supporter of bear-baiting! No fact could better present an idea of what was still the backward state of feeling among educated persons on the subject of cruelty to animals.

The year 1826 found Mr Martin still at his post. He framed a bill to extend protection to dogs, cats, and other domesticated animals from cruelty. In this it might have been expected he would have been successful. But no. His arguments to move the House of Commons were unavailing. Mr Martin died in 1834. Not until 1835, when more enlarged ideas prevailed, was there an Act to throw a protecting shield over cattle in the market, on the way to the slaughter-house, and in the roads and streets generally; over all such animals as dogs, bulls, bears, or cocks, kept for purposes of baiting or fighting; over all animals kept in pounds or inclosures without a sufficiency of food or drink; and over all worn-out horses, compelled to work when broken down with weakness or disease.

It was reserved for the beneficent reign of the present Queen to see a comprehensive Act of Parliament for the prevention of cruelty to animals. This was the Act of 1849 (which was extended to Scotland in 1850), that now forms the basis for prosecuting cases of cruelty, and may be called the charter which conferred on domesticated animals a right to protection. Lamenting the backwardness of England in establishing such a charter, it is not without pride that one knows that England was after all the first country in modern times to enforce the principle that the lower animals are entitled to be protected by law. That principle, as we have shewn, is not new. It was recognised by the ancient Hebrews, and it is pleasing to feel that at length modern common-sense has legislatively assumed its propriety. Latterly, there have been several additional Acts of Parliament, chiefly

as concerns protection to sea-birds and small land-birds; but while well meant, these Acts are very imperfect. The eggs of sea-birds not being protected, the nests of these animals may be rifled with impunity. As regards small birds, a number are left out in the list of protected animals—the skylark for one. These deficiencies are unfortunate. Sea-birds, though generally looked on with indifference, are of great public utility. They benefit agriculturists by eating the worms and grubs in newly ploughed land; they hover over parts of the sea and point out where there are shoals of herrings and other fish; they are useful to the mariner in foggy weather, by their warning cries near the rock-bound coast. How beautiful that arrangement of Nature, in making provision for birds to live on shelving rocks by the sea-shore, there to act like beacons, in warning off the bark of the mariner from a coast that would cause its destruction! Considering that wonderful provision, how scandalous, how short-sighted the practice of rifling the nests of sea-birds! A supplementary Act to protect the eggs of sea-birds cannot, as a matter of public duty, be too soon passed. Already, on some parts of the coast, sea-birds are said to be rapidly disappearing.

As every one knows, dogs are often lost in large towns, and roam about miserably in search of their master or mistress. A sight of them in such circumstances is exceedingly pitiable. In the Metropolis, a humane plan for succouring lost dogs has been established. Some years ago, a benevolent lady, Mrs Tealby, was enabled, by the aid of public subscriptions, to set on foot a temporary Home for Lost and Starving Dogs, which has existed since 1860. It is situated at Battersea Park Road. Any dog, when found and brought to the Home, is taken in and succoured under certain necessary conditions. If a dog, after being housed and succoured, is applied for by the owner (with satisfactory proof of ownership), the animal is given up on payment of the expenses of its keep. If no owner comes forward, every unclaimed dog is sold for the benefit of the institution, or otherwise disposed of according to circumstances. The Home is growing in usefulness. In one year recently more than three thousand three hundred dogs were restored to their former owners or sent to new homes. Many owners who recover their favourites through the agency of this institution, not only refund the expenses incurred, but assist the funds by subscriptions in the name of their recovered pets—as for instance, 'In memory of Pup,' 'For little Fido,' 'In name of darling Charlie,' 'The mite from an old dog;' and so on. This deserving and well managed institution is well worth visiting. Only, the visitor must be prepared to see painful demonstrations from some of the unhappy inmates. On the approach of the visitor, each animal eagerly hastens to see if he be his dear master. And when a sniff and a glance render too evident the fact that you are not the person wished for, something like a tear steals from the poor doggie's eye. The happiness shewn when one of the animals finds his lost master is equally expressive. Looking to the great good done in the cause of humanity by this meritorious Home for Lost and Starving Dogs, it may be hoped that efforts will not be wanting to establish similar institutions elsewhere.

There is another admirable establishment worth

referring to. It is known as the Brown Institution, from having been founded by the bequest in 1851 of a large sum of money by Mr Thomas Brown. Its design was the advancement of knowledge concerning the diseases of animals, the best mode of treating them for the purpose of cure, and the encouragement of humane conduct towards animals generally. The Institution combines the quality of an infirmary and a dispensary for animals belonging to persons who are not well able to pay for ordinary medical attendance, and therefore does not trench on veterinary establishments. Several thousands of animals are treated annually. The Institution, which is under the direction of the Senate of the University of London, is situated in Wandsworth Road, near Vauxhall Railway Station. As an hospital and dispensary for poor horses, dogs, and other animals, the Brown Institution is unique of its kind. As far as we know, there is nothing like it in the world. What a prodigious step in advance is the Home for Dogs, and the Institution now described, from the condition of things at the beginning of the nineteenth century!

In speaking of the improved treatment of defenceless creatures within recent times, a prominent place is due to the Royal Society for the Prevention of Cruelty to Animals, located in Jermyn Street, London. Standing at the head of all organisations of the kind in the United Kingdom, this Society may be considered the watchful guardian of the rights of animals, and without whose agency the laws we have enumerated would, as regards England, stand a poor chance of being enforced. The business of this Society is conducted mainly by the employment of persons all over the country to find out cases of cruelty, and to bring the offenders to justice. The Society diffuses hand-bills and placards in places where they may come prominently under the notice of persons likely to infringe the law. It further has issued various publications calculated to stir up the feelings in behalf of animals.

The hand-bills and placards deserve special notice. Sheep salesmen are reminded that convictions have been obtained against persons for ill-treating sheep by cutting and lacerating their ears, as a means of identifying them from sheep belonging to other consigners. Shepherds are warned, by a cited example, to abstain from a specified mode of treating sheep for certain maladies; because pain is inflicted, which a veterinary surgeon knows how to avoid, but which an ignorant though well-meaning shepherd may not. Farmers are reminded that it is a punishable offence to crowd too many sheep together on going to market; instances being cited in which eleven sheep were crammed into a small cart, with their legs tied tightly together. Captains of freight steamers are informed that penalties have been enforced against a captain for so overcrowding his vessel, on a voyage from Holland to the Thames, as to cause the sheep much pain and suffering; carriers and cattle-barge owners are under the same legal obligations.

In regard to cows, one placard cautions persons sending them to market with the udder greatly distended with milk, and from which the poor animals evidently suffer much pain. Cattle rearers are told that penalties have been enforced against one of their body for sawing off

the horns of fourteen heifers so close to the head as to cause blood to flow in considerable quantity, and to make the animals stamp and moan; the object of such a mode of cutting being to increase the market value of the horns. Butchers are reminded that it is a punishable offence to bleed calves to death merely for the sake of giving additional whiteness to veal. Consigners and carriers are alike reminded that the Act of 1849 imposes fines or imprisonment as a punishment for conveying animals in such way as to subject them to unnecessary pain or suffering; the neglect to give proper food and water to the animals, whether coming to market, at market, or in removal from market, is announced in another hand-bill to be an infringement of the same statute.

Drovers, by another hand-bill or placard, are cautioned against urging on cattle which by lameness are unfitted to travel along the roads and streets; and against striking animals on the legs so violently as to lame them: both are practices to which drovers are too prone, and both are punishable. Farmers, graziers, and salesmen are alike warned that the season of the year should be taken into account in the transport of shorn sheep. 'It is hardly conceivable that respectable farmers and graziers, merely for the sake of profit, can in the months of December, January, February, March, or April, cruelly strip a dumb animal of that warm woollen coat which the goodness of God has provided more abundantly in winter to protect it from the cold weather; or that any English salesman will lay himself open to a criminal charge of aiding or continuing the offence by exposing shorn animals for sale at such inclement seasons.'

Horses and donkeys find a place in the safeguards which the Society endeavours to provide, by disseminating placards and hand-bills pointing out the penalties for cruelty or neglect. It is an offence against the laws to work a horse in an omnibus, cab, or other vehicle when in an infirm or worn-out state. It is an offence to beat a horse in a stable with a degree of severity amounting to cruelty, merely to make it obedient, or still worse, through an impulse of angry passion. It is an offence to set a horse to drag a cart or wagon loaded with a weight beyond his strength; many coal-merchants and their carmen have been prosecuted and fined for this unfeeling conduct. It is an offence to cruelly beat and over-ride poor donkeys; useful animals which seem fated to be the victims of very hard treatment in the world. It is a significant fact that one placard is addressed to 'excursionists and others': those who have witnessed the treatment of donkeys by their drivers, at Hampstead Heath, Blackheath, and the humbler grades of sea-side places where holiday people assemble, will know what this means. The Society aid the inspectors of mines, or are aided by them, in bringing to justice truck-drivers and others for working horses and ponies in an unfit state in coal-pits.

It was not likely that dogs would be left out of sight by the Society; the maltreating of such animals is the subject of some of the cautionary placards, especially in localities where rough persons, prone to dog-tormenting, are known to be numerous. Cats are the subjects concerning which other warnings are given, in regard to torturing or cruelly worrying. Fishmongers are reminded that

it is a punishable offence which many persons commit of 'putting living lobsters and crabs into cold water, and then placing them on a fire until the water is heated to boiling temperature, thereby causing them to endure horrible and prolonged suffering.'

That the feathered tribes should share the protection which the issuing of these placards is intended to subserve, is natural enough; seeing that the Sea-bird, Wild-bird, and Wild-fowl Acts were due in great measure to the Society. One placard states that it is a punishable offence to kill or wound any such birds (including the young in nests) within the prohibited period; and that those who sell such killed birds are also punishable. Another placard administers a similar warning in regard to wild-fowl, enumerating thirty-six species, all of which are to be safe from the gun, the snare, and the net from the 15th of February to the 10th of July, under penalties which are prescribed in the Act of 1876. Bird-fanciers are reminded that one of their fraternity was imprisoned for fourteen days for depriving a chaffinch of its sight as a means of improving its singing. Poultry-dealers are, in another hand-bill, cautioned against plucking live poultry, a cruel practice which, if proved, subjects the offender to three months' imprisonment. Carrying live fowls to market by their legs, with their heads hanging downwards; and exposing fowls to hot sunshine with their legs tied together—have brought the offenders into trouble. In another placard the patrons of pigeon-matches are warned that occasional cruelties practised by them or their servants come within the scope of the law. In one of the Society's publications, the cruelty of bearing-reins for carriage-horses is significantly pointed out.

The Society has been encouraged in its benevolent exertions by a letter from Her Majesty the Queen, addressed in 1874 to the Earl of Harrowby, in his capacity as President. There was an assembly in London of foreign delegates representing similar associations, on the occasion of the holding of the half-century jubilee of the parent Society. Her Majesty requested the President to give expression publicly to her warm interest in the success of the efforts made here and abroad for the purpose of diminishing the cruelties practised on dumb animals. 'The Queen hears and reads with horror of the sufferings which the brute creation often undergo from the thoughtlessness of the ignorant, and she fears also sometimes from the experiments in pursuit of science. For the removal of the former the Queen trusts much to the progress of education; and in regard to the pursuit of science, she hopes that the advantage of those anæsthetic discoveries from which man has derived so much benefit himself, in the alleviation of suffering, may be fully extended to the lower animals. Her Majesty rejoices that the Society awakens the interest of the young by the presentation of prizes for essays connected with the subject, and hears with gratification that her son and daughter-in-law shew their interest and sympathy by presenting those prizes at your meetings.'

Looking to the distinguished patronage of the Society from Her Majesty downwards, its vast array of supporters, and the large number of Societies which it has helped to originate at home and abroad, we naturally rely upon it for promoting a consolidation and expansion of the laws

against cruelty to animals. These laws, as has been seen, are composed of shreds and patches, brought into existence with difficulty, and in many respects imperfect. The time appears to have come when the whole should be combined in a statute applicable to all parts of the United Kingdom. That certain actions should be deemed cruelties punishable by law in England and not in Scotland, is anything but creditable, and not a little ludicrous. This is a point to which the attention of legislators should be seriously invited. From the fragmentary and confused condition of the statutes, we have experienced much difficulty in ascertaining what, as a whole, the law really is. This chaotic state of things detracts, we think, not a little from the glory which may be freely claimed by the English for their legislation in behalf of animals. A consolidated Act with all reasonable improvements, would be something to point to with satisfaction, and probably go far to insure a legalised system of kind treatment of animals all over the globe. FROM DAWN TO SUNSET.

A STORY IN THREE PARTS.

By ALASTER GREME.

INTRODUCTORY.

EVERY man loves the land where he got life and liberty. The heart of the mountaineer is chained to his rugged mountain-home; he loves the wild and whirling blast, the snow-storm and the brooding clouds. Every true heart beats truly for country and for home. Thus the 'children of the peat-bog' and the fen cling to the illimitable wolds and the 'level shining mere,' beautiful even now.

Beautiful *then*, when long ago, primeval forests clothed the land. When in later times the bells of minster towers sounded far and near, and the deep bay of the Brunswald hounds awoke the echoes of the wold; when old Crowland's towers gleamed through mist; and the heights of that far-famed isle, the Camp of Refuge, where, amidst blood and battle, and beneath the 'White Christ' uplifted, the gallant Saxon fought the wild Viking; where the Saxon made his last dread stand for England's liberty, while men fell dead, and bones lay bleaching on every island and valley of the fen.

Beautiful *now*, O Fen-land! where still I seem to hear the wild shout of your outlaw hunters, hunting the red-deer and the wolf; where still I seem to hear the war-cry of the men of Danelagh, or imagine the great fires sweeping the boundless plains. Wide are your marshes still, and dark and deep your woods; the keen winds bring the driving snow; dense fog and mist and drenching rains sweep strongly from the sea; dark and capricious are the autumn days, and full of storm; yet overhead stretches a free heaven, boundless and open; underfoot stretch the free plains, wide and open; and over all sweeps the magnificence of the cloud-scenery, unbroken and unopposed; and the splendour of

the sunrise and the sunset lights the low isles like flame.

PART I.—DAWN.

CHAPTER THE FIRST.

Thus did the suns rise and set in glory across the level lands of Enderby; old Enderby manor, where the Flemings had dwelt for centuries; old Enderby, with its 'clanging rookery,' its grand timber, its turrets and its towers. Under that arched gateway has swept many a gay cavalcade with hawk and hound; has passed slowly many a hearse with sable plumes and horses; has stepped many a brave bridegroom leading his blushing bride, while the far-famed bells of Enderby pealed out loud and clear.

It is nearly two centuries ago, and it is evening; the sun is setting. Sir Vincent Fleming stands under the gateway; he is booted and spurred; his jaded horse stands in the court-yard, and has been ridden fast and far. Sir Vincent puts a whistle to his lips and whistles loud and shrill; he is looking across the wide holt with a smile—his eyes laugh under his thick black brows, and his long white hair is flowing free in the wind. He opens his arms wide, and there come flying towards him two little dark figures neck and neck, shrieking with laughter and with glee. Panting, breathless from their long run, a boy and girl rush through the gateway, and leap boisterously into Sir Vincent's arms.

'My two little pets of Enderby!' he cries, and there is a wail in his voice, half of sorrow and half of joy.

'An' what have you brought us, father?' asks Deborah, leaping and dancing in her gladness. 'I see your flaps are full!—Nay, Charlie; get away; you shall not have father all to yourself!'

But the boy fights hard. 'You are a greedy Deb!' he cried. 'Your thoughts are ever o' sweet-meats an' o' toys.'

'Nay; it is not so,' retorted Deborah shrilly and scarlet as a rose. 'I am glad when things come.—But father, I am gladder to have *you* come.'

'I believe thee, sweet heart!' and Sir Vincent, lifting little Deborah to his shoulder, and taking his boy by the hand, turned towards the house.

In those days many a care pressed hard on Sir Vincent Fleming. His beautiful wife, the mother of his children, lay dead in the little churchyard. For a short time the children had run wild; then for a time Sir Vincent gave them a hard, hard step-mother, and the children went from bad to worse. Little Deborah cut her hair like a boy, and the two ran away from home. But ere long the hard step-mother died, leaving Sir Vincent free and the children like two mad colts. Sir Vincent tried the experiment no more. He could not cope with his two wild ones; they were beyond him; they were given over entirely to old Dame Marjory, and she voted them 'a handful.' Never wilder youngsters trod the earth. The hot blood of the Flemings and the Stuarts, with a dash of cast not so easily pedigree'd, coursed in their veins, and they could not brook a word of opposition or reproof. Dearly did they love their father, and dearly loved they one another—in a wild way more intensely than either knew.

One day they were running in one of their mad

games, 'Hare and Hounds,' with all their village crew behind them, when their course led straight through the churchyard of Enderby. Vaulting over the low wall, they rushed bounding over the graves with yell and whoop and laughter. Soon the whole gay thoughtless throng passed away. But an hour after, in the twilight, a boy and girl came gliding back alone hand in hand; half-wistful and half-scared, they opened the churchyard gate, Deborah urging forward Charlie.

'What do you want?' asked the boy half sullenly. 'I'll not come!'

'I do want,' said little Deborah, 'to go to mother's grave! Dost know what we did, Charlie? An' my heart has ached ever since, nor could I hunt the hare for thinkin' of it. We trampled over mother's grave! When we jumped over yon wall, I tell you, Charlie, we ran on mother's grave! Come with me, Charlie, an' kneel down to her to forgive you an' me!' In the highest state of excitement, the little child caught his unwilling hand.

'But she won't hear us,' said the boy; 'mother's gone to heaven, Marjory saith. Thou art a girl!' he cried, as they stood beside the grave. 'These be bones that lie here. It is like your fancies! Mother's gone to heaven, I tell you.'

'That's true,' said Deborah; 'but mother sees her grave, an' she looks down an' has seen us run over it this day, an' laugh! Maybe she thinks we have forgot her; maybe she thinks we have forgot the prayers she taught us.—O mother, it is not so!' With unconscious and most exquisite fervour, the little Deborah fell on her knees, and raised her eyes and clasped hands to heaven: 'We are naughty, but we've not forgot you, sweet mother. Charlie has not forgot you, mother; an' Charlie an' me look up to you as you are lookin' down, an' ask you to forgive us for treadin' on your sweet grave. Mother, dear mother, forgive us!'

The boy stood looking on in dogged silence, knitting his brows; but when he saw Deborah's tears, tears rushed to his own bright eyes. With a cry of passionate sorrow and remorse, he flung himself on his mother's grave and cried as if his heart would break. Charlie Fleming had idolised his mother. He was two years older than Deborah; he remembered the mother better. He never forgot her memory. Proud, reserved, and shy, he hid that memory in his heart, and would let no hand drag it forth. In his mad freaks, when old Dame Marjory, driven to distraction, solemnly upbraided him about his 'poor dear mother' and what *she* would have thought, he mocked, and ran away shouting his derisive laughter. Seldom would a tear dim those bright roving eyes; neither rod, nor threat, nor lecture made Charlie Fleming quail; clenching his teeth and his hands, he stood his ground like a little demon: his stubborn heart would have broken rather than yield a whit.

And what of Deborah Fleming? she who, at eight years old, cut her flowing locks like a boy, and ran away from home. She was not behind her brother in mischief, wit, or daring; wondrously bold was the spirit of the little Fleming. But the caprices of the child shall speak for themselves.

CHAPTER THE SECOND.

One afternoon Deborah was playing by the lodge-gates with little Margaret Dinnage, the bailiff's child, when a tall gipsy woman strode to

the gate and looked through. Meg ran away with a scream of terror, but Deborah stood and stared up at the gipsy.

She was a tall woman, dressed in faded red, with a yellow and scarlet shawl tied over her head; long glittering rings in her ears, and black, black eyes. Deborah never all her life forgot that woman looking through the gate; the vision was riveted on her childish memory.

'Come to me, pretty one,' said the woman, tossing her head backward; then imperiously: 'Come.'

'Where?' asked Deborah.

'Over yonder—to the camp. We want a pretty one like thee. I am gettin' old, child, an' I want you to come run arrands an' tell the fortunes o' the qual'ty.'

'I am the quality,' said Deborah gravely.

'You!' retorted the gipsy, with sudden and savage scorn. 'You are o' the scum o' the airth!' Then in a moment the wild passion passed, she resumed her half-coaxing, half-imperative manner: 'Come, come, pretty love!'

Deborah had been half startled; now she knew not what to make of the gipsy woman. Did the gipsy really like her, and wish to be kind? Deborah had never moved her large wondering eyes from the gipsy's face.

'I will not come,' she said, 'without Charlie.'

'Well, fetch Charlie, quick!' answered the gipsy with intense eagerness, and stooping forward to whisper the words. Deborah drew back; something within her rebelled; the woman was too imperious and too bold.

'Charlie will not come,' she answered; 'he hates gipsies.'

'Then thou shalt come alone.' Quick as thought the long arm was thrust through the half-open gate and the iron hand round Deborah's wrist, as if to draw her out, when Deborah cried at the top of her voice: 'Jordan, Jordan, Jordan!' An old man in a red waistcoat and his shirt sleeves came running round the lodge from the wood, and at the same moment the gipsy woman, pushing Deborah violently backward, darted away. Deborah was thrown on the back of her head; she got up at once, and stood looking up at old Jordan in silence, with her hand at the back of her head.

'She hath hurt thee, the jade!' said the old man indignantly. 'What has she been a-sayin' and a-doin' to thee?'

Deborah gazed at her fingers: there was blood on them; she raised her clear gray eyes to Jordan's face.

'Why, she hath cut thy head open, my lassie, and badly too! I know them cursed gipsies! Spiteful demons! See ye never meddle with them again. This comes on it.' And assuming a scolding tone, the old man took Deborah's hand and hurried her angrily into the lodge. He was frightened, very pitiful and very angry, all in one; now he coaxed, now he threatened.

'Let me bind up thy broken head, my lassie; it is broken badly. But thou'rt a brave little lady! This comes o' meddlin'; thou'rt all too inquisitive by half. Leave them gipsies alone; or sure as thotters, ave, I'll tell the master. Now then, thou'rt a brave little lady. Doth it pain thee, Lady Deb?' He stooped to peer anxiously with his old gray eyes into his little mistress's face.

Deborah was sitting on a high chair in the

middle of the table, looking very white and grave. 'I should think it doth,' she said; 'you are a gaby to ask it, Jordan Dinnage. Finish to tie my head; and see that you do not tell father who cast me down,' she added with dignity.

The little Margaret was standing below, gazing upward at the operation in affright, with her round eyes and mouth wide open.

'Tell thy father!' retorted old Jordan with supreme disdain as he finished his surgery. 'Why, he would burn the camp and all the varmin in it for this. Fine times there'd be for Enderby with them revengeful cats. They'd be burnin' Enderby. Where wouldst thou be then?'

'In the flames, Master Dinnage,' said Deborah coolly.

Old Jordan Dinnage laughed loud and long. 'Thou art a little bold wench!' he said; then turning to his little daughter, added with mock gravity: 'Mistress Dinnage, well mayst thou gape an' stare. Thy young mistress will be the death o' me; for floutin' an' for scorn, I never knew'd her equal.'

The little maiden went quietly home, rather proud of her bandaged head than not; and the sight was so little novel to Dame Marjory's eyes, that well as she loved the child, she scarcely asked a question. That night Deborah tossed in her little bed and could not sleep. The pain in her head she heeded not; her wild and fitful fancy was conjuring up the gipsy camp. A hundred tall figures went trooping by, all with yellow and scarlet shawls tied over their heads; and tall men with black eyes, and little children, little boys with beautiful black eyes and curly hair. Dogs were lying about, and great pots full of meat were slung on poles over fires, and the red watch-fires blazed over all. She fancied all these men, women, and children came and kneeled to her, and said she was their queen. One little boy, more beautiful than the rest, said he was destined for the king, and she would be his wife. Then they hung about her necklets and bracelets, and set a crown upon her head, and the little maiden saw herself queen of the gipsies. Deborah loved power, and knew the power of beauty. She fancied herself dancing before the gipsies, in the light of the fires, in a glitter and blaze of beauty.

On the other side of the room slept Dame Marjory; she was snoring loudly. Deborah, hot and excited, sat up and gazed round; she could not rest. She started up, and sped like a little ghost into the next room, to Charlie's bedside; she seized his arm, and shook it: 'Charlie, Charlie!' The boy gave a cross snort. 'Charlie, art well awake? I have somewhat to tell, love. The gipsy camp is out on the fen, an' to-morrow I am goin' to visit them! You will come too Charlie, for there be dogs an' horses in plenty. An' mayhap you will be made the king. I mean to be the queen; for the gipsy woman has been to the gate this afternoon, an' invited me to go an' bring you along.'

Charlie stared in the dim light, well awake then, yet very cross. 'You! You are always "bringin' me along," forgettin' you are the youngest by two years. You are very wise an' grand. I am not so fond o' gipsy folk; they are sneaks and cowards.'

'Nay; they are not! If you are afraid, I'll go

alone; an' I'll ride on the vans from one end o' the world to the other. So good-e'en.'

'Stay!' cried the boy. 'You say I am afeard. Then you know it is a lie! A Fleming never knew fear. So father tells you. Dost say I am afeard?'

But Deborah, feeling the grasp of his hands on her arm, cried: 'Nay, nay; you are not afeard! Belike you are wise, an' that is why. But I will go alone.'

'Nay; that you shall not!' cried the boy, glad to see a way to change. 'Why, they would kill you,' he said, with an air of superior wisdom and scorn. 'If you *will* go, I go too. I will take my big stick, an' (say not a word) a knife under my clothes, for the gipsy folk be sly as foxes, an' in one minute might stick you through. I must be fully armed.'

'An' so must I,' quoth Deborah.

'You!' said the boy in loud derision; 'you are a *girl*; though I ne'er knew the like for tomboyin'. Run to bed; an' we will see what to-morrow brings.'

CHAPTER THE THIRD.

The morrow saw Master Fleming and Mistress Deborah speeding along the fields. Charlie carried a mighty stick, cut from a tough ash-tree, and a knife beneath his skirts; Deborah too, secretly, had a long blade concealed, to her own heart's satisfaction. Drawn to danger like moths to candle-flare, these little hardy Flemings sought an adventure after their own hearts. When they reached the level downs and the long expanse of shining water, the gipsy camp burst full on view. It was a sight familiar to their eyes; the dauntless Charlie knew it well. Many an hour, when Dame Marjory, shut in with her pickles and preserves, thought Master Fleming intent over his books, he was riding a bare-backed pony on the downs amidst a ragged crew. Many a raid on those same camps had Master Fleming dared; and twice, hunted by them, had the bold boy fled for liberty, or life. So that, knowing the gipsy nature, he did not approach the camp with Deborah without misgiving or unprepared for flight.

'Now see; if the gipsies curse or hunt us,' he said to Deborah, as they paused, 'that you do not lay hold on me, but run for your life; you can run like a hare; so can I. They may not be best pleased to see us.'

With a heart that beat somewhat faster at her brother's words, Deborah gave assent, and they advanced hand in hand. But in another moment their approach was seen by one ragged sentinel, and with shrill cries of delight they were surrounded by a weird elfin band. Their eyes were beautiful and black, as in Deborah's vision; but upon close quarters, they were all rags and dirt. They swarmed round their old playmate, staring in dumb amaze at Deborah's fair loveliness. Charlie clutched his stick.

'Now stand back!' he cried, in a loud authoritative voice, 'an' I will give you copper pence.' He struck his stick on the ground, and the ragged boys and girls all started back and stood in a circle round them. Deborah was abashed and overwhelmed with admiration at her brother's potent sway; her eyes were riveted upon him. The youthful captain was aware of this, and with added dignity turned upon his troop: 'First, first,' quoth

he, 'you must catch two ponies for Mistress Deborah an' for me, the biggest an' the best, an' we will race you. The first one who wins gets the prize; an' if I win or Mistress Deborah wins, we win the prize, an' give it to the first man in: an' that is fair play, seein' our ponies must be the biggest an' the best. But stay. Come on the common, and let them not see us in the camp. After the race is done, we will go an' speak to your grandam, old Dame Shaw, and stay the night mayhap.'

With yells of glee the whole troop rushed hooting over the common, tearing hither and thither after colts as tameless. Deborah's hat was off and her hair flying, the soul of glee was dancing in her eyes. They caught one restive steed; in a moment she was across his back like a boy, and in another minute they were off! Thus the hours fled away, all too fast for them; all the largess of the young captain was thrown away and scrambled for. Deborah's dress flew in tatters round her; she looked the wildest gipsy of them all.

Night came, and vainly through the shades of evening did old Dame Marjory, shading her eyes in the doorway, look for her truants. Sir Vincent was out, and not likely to return. At last she sought Jordan Dinnage, her ancient lover and Enderby's right hand. 'Jordan, hast seen Master Charlie and Lady Deb? A pretty kettle o' fish to fry if they return not to-night, an' the master comes home i' the mornin'. Go seek them, for heaven's sake, man. I am distraught!'

'Why, this comes, Mistress Marjory, o' lettin' the young Master run wild; he's a handful for thee! I know'd how 'twould end, when he's day an' night out gipsyin'. There's where they be, Mistress Marjory, with the gipsies; an' thank yer stars if ye ever set eyes on them agen!'

Old Marjory turned as white as her apron. 'Now, don't ye be goin' to frighten me, Jordan. But if ye speak truth, man, run with all the men you can get along, an' hunt them gipsies down, an' find my two poor dears. O their poor mother! O Jordan, Jordan, Jordan Dinnage!' And Marjory, with her apron to her face, cried as if her true heart would break.

This was too much for Jordan; he was arming already. Snatching a short rusty sword from the wall, and with one comforting hand-thud on Dame Marjory's back, and a 'Comfort thee, my lass!' the active old man was off. The hue-and-cry was raised—all Enderby rang with it. But behold the gipsy camp was gone! Smouldering fires blackened the common; no other trace of the fugitives was visible. But old Jordan rode and rode, with all his men behind him; some on horseback, some on foot, they scoured the country far and near. In vain did Dame Marjory and the servants sit up till morning dawn. It was only late on the following day t'at the bailiff rode up the avenue with another horse, an, one carrying a boy before him, the other a girl; the dresses of both men and children were torn and travel-stained, and the head of Jordan Dinnage tied up. At this sight Dame Marjory ran forward and screamed, and all the women screamed.

'Here be thy childer,' said Jordan; 'an' a hard fight we made for it. Keep a tight hand on 'em, Dame Marjory; but no scoldin' yet.'

So Charlie and Deborah, looking penitent and demure, but rejoicing madly in their hearts at

seeing home again, ran in. They were feasted royally in the servants' hall that day!

For many days Sir Vincent did not return, and Jordan Dinnage kept a sharp watch on the gate, to see that the children did not stir beyond. The old vicar called on the little culprits; he looked to daunt them by his words and presence. He was a sad-looking man with a long fallow face; yet some quaint humour lurked in his nature too. Severely he bade Dame Marjory send 'Master and Mistress Fleming' to him. The boy stoutly rebelled; but at last hand in hand, scrubbed and ruffed, they were ushered into the room where the awful vicar sat. Charlie was dressed in a little black velvet doublet and hose, with silk stockings and buckle-shoes, and ribbons at his knees; his long red-brown hair was cut square on his white forehead, and flowed loose on his shoulders; his lips were set firm, his brown brows were knit, and his eyes, large dark and sombre like a stag's, glowered defiantly beneath them. Mistress Deborah was dressed in pale blue silk, pointed to her fairy shape, and trimmed with rose-coloured ribbons; her hair was in hue like her brother's, and cut the same in front, but falling lower behind, and tied at the end with a bow; her lips were apart, and her white teeth gleamed with irrepressible humour; her large bright eyes, gray like a falcon's, gleamed with laughter too; she half hung behind her brother, with her head upon his shoulder, saucy yet shy.

The vicar, in his long black clothes, gazed upon the pretty picture from a high-backed chair, stern, melancholy, resigned. The little Flemings stood before him just as they had entered. 'Children,' quoth the vicar of Enderby, 'it hath afforded me great grief to hear of thy misdeeds; they have been reprehensible in the extreme. Thou hast encouraged vagabondism, and run near becoming vagabonds thyself; in fine, thou hast outraged propriety and set all social laws at defiance. To thee, Charles, I should have looked, in thy father's absence, to set an example to thine interiors, to guard the house, and to protect thine infant sister (or little better than an infant, either in years or discretion). Thou hast proved thyself, Charles, incapable of either charge; indeed, if thou art not sent to school, to feel a master's rod, I entertain great fears for thy future, and so I shall inform thy father. To thee, Mistress Deborah, I say little; thou art young and inexperienced, though much given to vanity, it is said, both in dress and person; but though thou art as yet incorrigible, I would have thee reform, and entertain some hopes of thee. Thou art the future mistress of this house; how then, when thou comest to years of discretion, wilt thou fulfil thy duties of mistress and of hostess, if thou dost now run wild amid grooms and gipsies? Mistress Fleming, Mistress Fleming, I have much against thee! What induced thee the second time to run away from such a home as this?' But Deborah only hung her head and smiled.

Then quoth Charlie sturdily, glowering with his red-brown eyes: 'She loves the gipsies, like to me.'

'Charles, Charles!' said the vicar, 'I will not bandy words with thee. Forsake such evil company, and stick to thy Latin more.'

'I don't love Latin, Master Vicar, an' never shall.'

'Goodsooth, thou wilt and shall. What wouldst thou be? Wouldst idle here all thy days?'

'I'd be a soldier.'

'A soldier? An ungodly set!'

'Father says the priests are the ungodly ones.'

At this the vicar held his peace in despair.

'I'd be a gipsy queen,' chimed in Deborah's treble voice. 'Dost not love the gipsies, Master Vicar? When I am a woman grown I'll run off and travel over the world—I will! Charlie does not love Latin; no more do I love Dame Marjory's lessons.' And forgetting her fear, she nestled up to the vicar's side and gazed up with her laughing dauntless eyes. At that moment the clank of horse's hools resounded on the stones of the courtyard.

A TYROLESE CATASTROPHE.

MANY and varied are the calamities to which those people are exposed who have their abodes among the grim mountain fastnesses of Switzerland and the Tyrol, or indeed who live in any similarly situated region, where Nature still reigns in undisputed majesty, and manifests her power by those swift and awful catastrophes which strike terror to the hearts of all who come within their influence. In winter the snow falls heavily and constantly, and forms a huge overhanging mass, that overtops the often narrow pass below, and is suspended, like the sword of Damocles, by the slightest possible retaining hold; a trifling noise, such as the discharge of a rifle or even the prolonged blast of the Alpine horn, being sometimes sufficient to dislodge the vast snow-wreath, and send it gliding on its silent but deadly course towards the valley beneath. The destruction caused by the overwhelming avalanche is too well known to need description. Scarcely a Swiss hamlet or mountain pass but has its record of some sad calamity caused by the resistless force of those fatal snow-falls. Single travellers, parties varying in number, chalets, and even entire villages, have on different occasions been buried under the snow; no warning having been afforded to the hapless victims till the icy pall of death descended relentlessly upon them, and hid them, sometimes for long months, sometimes for ever, from their fellow-men.

Those who live on the banks of the narrow, swift-running torrents that intersect the valleys, have another danger to encounter. Those little streams, greatly swollen in summer by the melting of the snow on the higher ranges of the mountains, frequently overflow their boundaries and spread destruction and death around. If, as occasionally happens, the stream becomes choked by débris from the overhanging precipices, it is turned aside from its natural channel, and flows in quite another direction; sometimes forming in its progress a lake or a small tarn, which never again subsides, and which may destroy in a moment the long and arduous labour of the husbandman.

A third and even more tremendous catastrophe is that known as a berg-fall or mountain landslide; when an overhanging portion of some steep precipice becomes loosened from its foundations,

and on some unusual impetus being given to it, topples suddenly over and hurls itself upon the plain beneath it. These berg-falls occur very frequently in the Tyrol, sometimes occasioning comparatively little damage, and even adding an element of picturesqueness to the great natural beauty of the region; while on other occasions they are followed by widespread havoc and destruction.

In 1771 a terrible calamity of this nature befell the little village of Alleghe, situated on the banks of the river Cordevole, not far from the town of Caprile in the Tyrol. The district was a fertile and beautiful one, with several scattered villages surrounded by orchards and corn-fields, and protected from the fierce blasts of winter by the range of high mountains, which were at once its safeguard and its peril. At the base of one of the loftiest of this great range, called Monte Pezza, stood the little village of Alleghe. In the month of January, when the mountains around were all covered with heavy snow, a charcoal-burner was at his work in the woods of Monte Pezza, when his attention was suddenly arrested by a distinctly tremulous movement of the ground, and by the frequent rattling down of stones and debris from the rocky precipices behind him. These were sufficient indications of danger to the practised ear of the mountaineer. He knew too well the portents of those overwhelming catastrophes that are continually to be dreaded; and on listening more attentively, he became convinced that serious peril was impending. Even as he watched, several large boulders became detached from the face of the mountain, and rolled down to a considerable distance; while at intervals the trembling motion of the ground was too evident to be mistaken. It was growing late in the afternoon, and darkness would soon fall on the valley; so hastily quitting his work, he made the best of his way down to the nearest village, and with the excitement naturally caused by anxiety and fear, he told the inhabitants of the alarming indications he had just witnessed, and urged them to make their escape without loss of time from the threatened danger. Strangely enough, they seem to have attached no value to the signs of approaching mischief which the man described to them; and it would appear that they considered the falling debris to be attributable to some accidental snow-slip, caused possibly by the warm rays of the noonday sun.

Whatever they may have thought, they paid no heed to the warning; and the charcoal-burner having done all he could to save them from the threatened calamity, went on as fast as possible to carry his terrible news to three other villages, which were all directly exposed to the like danger. But they also utterly disbelieved in it, and laughed at the fears of the poor man, whose breathless and agitated condition clearly testified to the truth of his conviction that a very great peril was close at hand. One and all, they refused to quit their dwellings; and the charcoal-burner, having vainly endeavoured to awaken them to a sense of their danger, quitted the spot himself, and sought shelter elsewhere. Hours passed, and no further disturbance of any kind taking place, the villagers concluded the whole thing to have been a false alarm, and at night all retired to rest as usual, without apparently a shadow of misgiving.

Suddenly, in the midst of the silence and darkness, a fearful crash of falling rocks sounded far and wide through the valley; and when the first rays of the sun lighted up the mountain peaks, a terrible scene of ruin and death was revealed. The four little hamlets had entirely disappeared; two of them, those that lay nearest to the slopes of Monte Pezza, were completely buried under an immense mass of fallen earth and rocks; the other two were submerged beneath the waters of the river Cordevole, which had been driven from its course by the berg-fall, and had spread out into what is now known as the Lake of Alleghe. None of the unhappy victims had a moment's time for escape, even had escape been possible. The rushing down of the mountain was instantaneous, and buried them as they lay sleeping; and the water flowed with impetuous rapidity into the unprotected villages, not one inmate of which survived to relate the experiences of that awful night.

Some months passed; and the first horror of the catastrophe had a little faded, when another berg-fall took place, again followed by lamentable consequences. It occurred in the month of May and in daylight; but a much smaller loss of life was the result, though the destruction of property was even greater than on the previous occasion. Owing to the tremendous force exerted by the falling debris, the waters of the lake, which had never subsided since its formation, instantaneously rose into an enormous wave, and rushed violently up the valley; wrecking houses and farm-buildings, destroying the flourishing orchards and corn-fields, and carrying away a portion of the parish church of a village which had been re-called Alleghe, after the submersion of the first of that name. The organ of this church was forcibly swept to a considerable distance; and a tree borne along on the mighty wave was dashed into an open window of the curé's house, while he was sitting at dinner, the servant who was attending on him being killed on the spot. Many lives were lost during this second great berg-fall, and terrible consternation was created in the minds of the inhabitants of the district, which seemed to have been so specially singled out for misfortune.

Since that time, however, no other serious disaster has befallen them; the huge mountains of the neighbourhood have not again hurled death and ruin on the smiling valley at their feet; and the little lake of Alleghe, the principal memorial of the catastrophe, is only an added beauty to the lovely scenery which surrounds it, and lies there in serene tranquillity, all unconscious of the beating hearts for ever stilled beneath its waters, of the happy homes rendered dark and desolate by its cold cruel wave. More than a hundred years have passed since then; many generations of villagers have lived and died, and the recollection of the great berg-falls of 1771 has faded into a mere tradition of the place; but yet, looking down into the clear depths of the lake, on a day when there is no wind to raise ripples on its surface, the outlines of the submerged villages can be distinctly traced. Roofs and walls of houses can yet be distinguished; it is even said that the belfry of the church is visible, flights of stairs, and many other relics of the past life of the drowned inhabitants.

On the 21st of May in each year, the date of

the second of those great disasters, a solemn commemorative service is celebrated in the little church of Alleghe, and masses are performed for the souls of those who perished in the two fatalberg-falls of 1771.

SINGING AND TALKING BY TELEGRAPH.

PEOPLE are already to a certain extent acquainted through the newspapers with what is called the Telephone, or instrument for transmitting musical sounds to a distance. We wish to say something of this novelty. The conveyance of sound by means of an electric wire, has been practised through the instrumentality of the bell telegraph, used occasionally, though much less frequently than apparatus of a different kind. The signaller does not himself ring a bell, but sets in vibration a bell at the further or receiving end of the wire. The electric current, passing through the wire, acts upon a small magnet, and this in its turn acts upon a small bell or its hammer. By a preconcerted arrangement, one single sound is understood to denote a particular letter or word; two denote another letter or word; three quickly repeated, have a separate meaning; three separated by unequal intervals of silence, another—and so on. The receiver must have a quick ear, and much practice is necessary for a due fulfilment of his duties. Although the plan has an advantage in enabling him to understand a message in the dark as well as in the light, it has more than equivalent disadvantages; among which is the fact that it leaves no permanent record.

But talking by electricity conveying the actual sounds of the voice for many miles—what are we to think of this? And a song—the words, the music, and the actual quality of the singer's voice; does not this seem almost beyond the powers of such a mode of transmission? Who first thought of such a thing is not now known. Very likely, as in most great inventions, the same idea occurred to many persons at different times, but was laid aside because the mode of realising it was not sufficiently apparent.

It was about 1860 that Reis invented a contrivance for employing a stretched membrane vibrating to a particular pitch or note; a contact-piece was adjusted near the membrane; and a series of rapid contacts sent a series of clicks along an electric wire to an electro-magnetic receiver at the other end. But the apparatus could only convey one note or musical sound.

Four or five years ago, Mr Edison, a telegraphic engineer at Newark in New Jersey, made an attempt in this direction. It is known that, in one form of automatic chemico-electric telegraph, signals are recorded by sending an electric current through prepared paper saturated with a chemical agent which changes in colour wherever the current touches it; the paper is moved on equably, and a pen or stylus rests upon it, conveying the impulse received from the electric wire. Mr Edison has tried to devise an arrangement for producing sound as well as discoloration, something for the ear to hear as well as something else for the eye to see. We are not aware whether his experiments have been sufficiently successful to produce a practically useful result.

In 1874, M. La Cour sent audible signals from Fredericia to Copenhagen, by means of a tuning-

fork, a contact-piece, a telegraphic wire, and a key to set the fork in vibration.

Mr Elisha Gray appears to have made a more definite advance in this direction. He has transmitted the pianoforte sounds of a concert through the wire of an electric telegraph. The performer played at Philadelphia, to an audience at New York, ninety miles distant. The apparatus may be called a telephonic piano; it transmits the sounds of that instrument, but of no other. Public performances of this kind were given in the early months of the present year. On one evening the instrument was played at Chicago, and the music heard at Milwaukee, eighty-seven miles distant. *The Last Rose of Summer*, *Yankee Doodle*, *The Sweet By-and-by*, and *Home, Sweet Home* are named as the tunes thus played. On a second occasion the apparatus triumphed over a distance of no less than two hundred and eighty-four miles, from Chicago to Detroit; not much was attempted in actual music, but the sounds were audible at this great distance. Two instruments are required, a transmitter and a receiver. There is a keyboard of two octaves (available therefore only for simple melodies), a tuning bar, an electro-magnet, and an electric circuit. The play on the keys with the fingers produces vibrations, thuds, molecular movements, in rhythmical succession; these are transmitted by the electric wire to the receiving apparatus at the other end. This receiving apparatus is a large sounding-box, on which is mounted an electro-magnet. The box intensifies the sounds by its sonorousness, through the medium of the slight touches which the magnetised iron gives to the box at every expansion or elongation which the electro-magnetism gives it. Delicate experiments have shewn that there is a minute difference in the length of a bar of iron when magnetised and demagnetised; and Mr Gray appears to have taken advantage of this property in causing his magnetised bar to give a succession of taps to the resonant box. We believe that the apparatus requires wholly new setting for each tune. If so, the system bears the same relation to real pianoforte playing as the barrel organ does to the church organ; it does not lend itself to the spontaneous or extempore effusions of the player.

More comprehensive, so far as the scientific descriptions enable us to judge, is Bell's *telephone*, for the transmission of talk and sing-song as well as of instrumental sounds. If present indications should be really justified by future results, the imagination can scarcely picture the number of practical applications that may ensue. The inventor, Mr Graham Bell, went to America in 1871. He is the son of Mr Alexander Melville Bell, whose system of 'Visible Speech' has attracted a good deal of notice on both sides of the Atlantic. Both father and son have been practically engaged in perfecting a system for teaching the dumb to speak; and Mr Graham Bell set himself the task of accomplishing something which would justify him in saying: 'If I can make a deaf-mute talk, so can I make iron talk.'*

Mr Bell, when at Salem in Massachusetts, began

* The subject of 'Visible Speech' is not unfamiliar to the readers of *Chambers's Journal*. In the number for May 12, 1866, a succinct account of the system is given—a system intended to remedy the utter want of agreement between the appearance and the sound of a letter or a word.

to turn his attention to this subject, the telegraphy of sound, or *telephony*, in 1872; but three years elapsed before the matter assumed such a form as to enable him to send a little musical message through a two-mile wire. Securing his invention by a patent, he gave his first public exhibition of the system in the autumn of 1876. The talk or speaking of an operator at Cambridge, Massachusetts, was heard at Boston, in the ordinary conversational tones. It does not appear that the actual quality or *timbre* of the voice was distinguishable, but only a voice, speaking certain words. Early in the present year, however, further improvements were made in the apparatus which enabled it to shew even this kind of delicacy; that is, it transmitted not merely the words in sound, but also the tones and inflections of different voices. Singing being, in regard to acoustics, only one variety of speaking, it follows almost as a matter of course that if the apparatus can talk it can also sing. Accordingly, a lady sang *The Last Rose of Summer*, and was distinctly heard at the distant station; the sounds 'had about the same effect as if the listeners were at the rear of a concert-hall, say a hundred feet from the singer.' The sounds of laughter and applause were similarly transmitted, with the proper rhythm and key or musical pitch. In instrumental music a violin could be distinguished from a violoncello; a test more delicate than would be supposed by many persons.

In all the earlier experiments of Professor Bell, he employed galvanic batteries to produce the current; but these were afterwards dispensed with, and their place supplied by permanent magnets. With this improved arrangement, sounds were conveyed through a wire to a distance of a hundred and forty-three miles, from Boston to North Conway in New Hampshire. Last February a lecture was delivered, on the subject of Telephony, by Professor Bell at Salem, and was audible, word for word, at Boston. In order to shew that the transmission is equally available in both directions, provided the proper apparatus is at both ends, the lecture from Salem to Boston was followed on the same evening by singing and speech-making from Boston to Salem.

From the patent specifications and from the descriptions in American scientific journals, it would appear that a phonographic reporter of some skill is needed, to translate the audible sounds into words and write them down. We must first comprehend, however, the mode in which the sonorous transmission through the wire is brought about; for this it is which really constitutes the principle of the telephone. Ordinary telegraphic coils of insulated wire are applied to the poles of a powerful compound permanent magnet; and in front of these is a thin vibrating diaphragm or membrane, with a metallic contact-piece cemented to it. A mouth-piece or trumpet mouth, fitted to collect and intensify waves of sound, is placed near the other surface of the diaphragm. It is known that the motion of steel or iron in front of the poles of a magnet creates a disturbance of electricity in coils surrounding those poles; and the duration of this current will coincide with the vibratory motion of the steel or iron. When, therefore, the human voice (or any other suitable sound) impinges through the tube against the diaphragm, the diaphragm

itself begins to vibrate, and the contact-piece awakens (so to speak) electrical action in the coils of wire surrounding the poles of the magnet; not a current, but a series of undulations, something like those produced by the voice in the air around us. The undulations in the coil produce a current in the ordinary telegraph wire with which it is placed in connection. A similar apparatus at the other end is hereby set in action, but in reverse order; that is, the wire affects another coil, the coil another diaphragm, and the diaphragm another tube, in which the sounds are reproduced in audible vibrations.

It is said that even a whisper can in this way be reproduced at a distance, the maximum extent of which may possibly be much greater than has yet been achieved. At one of the exhibitions given to illustrate this system, Professor Bell stationed himself in the Lyceum at Salem; Mr T. A. Watson at Boston. An intermittent current, sent through the eighteen miles of telegraphic wire, produced in the telephone a horn-like sound. The Morse alphabet was then transmitted in musical sounds, audible throughout the lecture-hall. Then the sounds of an organ were made to act upon the apparatus, and these in like manner were transmitted; two or three tunes being distinctly heard in succession at Boston. Professor Bell then signalled to Mr Watson to sing a song; this was done, and the words as well as the tune of the song heard. A speech was then made at Boston in the simple words: 'Ladies and gentlemen, it gives me great pleasure to be able to address you this evening, although I am in Boston and you in Salem.' This speech was heard distinctly in the Lyceum at Salem, and was followed by many questions and answers sent to and fro.

If monotonies be adopted instead of those variations in pitch which belong to ordinary music, it is believed that several telephonic messages may be sent through the same wire at the same time. It would be agreed on beforehand that all sounds in C (for instance) shall be intended for one station alone; all those in D for another station, and so on; each diaphragm would vibrate in the manner belonging to the sound-waves impinging upon it; but each station would attend only to those in a particular pitch. Such is the theory. Whether it can be practically carried into effect, the future must shew.

Mr Cromwell Varley, during his researches in duplex telegraphy, produced an apparatus which he is now trying to apply to telephonic purposes. A limited amount of success was achieved in July of the present year, through an electric wire connecting two concert-halls in London; but the apparatus requires further development. It comprises among other details a series of tuning-forks, one for each note.

There does not, so far as description goes, appear a probability that telephones would be so applicable as the machines already in use for ordinary telegraphic purposes; for reasons which we need not detail here. The conveyance of sound is the novelty; and whimsical suggestions have been put forth concerning the possible results, such as the following: 'One of the first steps which a young couple, upon their engagement, would naturally take, would be to have the speaking-wires laid down to their respective rooms, and then, at any time, far from the curious eye of the world, they would be

able to indulge in sweet converse.' Another: 'The extension of the system might not prove so pleasant in other cases. Thus, for example, university authorities might take it into their heads to attach an instrument to every room in the college, in order that the young men might report that they were steadily at work every quarter of an hour.' Another: 'It is hardly going too far to anticipate the time when, from St James's Hall as a centre, Mr Gladstone will be able to speak to the ears of the whole nation collected at a hundred different towns, on Bulgarian atrocities, or some other topic of burning interest. Nor need we despair of seeing Herr Wagner, from his throne at Bayreuth, dispensing the "Music of the Future" in one monster concert to St Petersburg, Vienna, London, New York—in short, to all the musical world at once.'

'HELEN'S BABIES' AND 'OTHER PEOPLE'S CHILDREN.'

THE two small volumes which give the title to this article, afford an amusing account of the troubles that befell Mr Burton in ten days, during which he somewhat rashly undertook the supervision of his sister Helen's Babies, the best children in the world (so their mother assures him), and of the vicissitudes through which his young wife subsequently passed, while endeavouring to manage 'Other People's Children.' To many, the incidents will appear too ridiculous; but it is to be kept in mind that the children are American, who for the most part are allowed to do pretty much as they like, and who, amongst other tastes, possess an untiring voracity for 'candy.'

When we first make his acquaintance, Harry Burton, a salesman of white goods in New York, is a bachelor aged twenty-eight, and is in some doubt as to where he shall spend a short holiday, so as to secure a quiet time for reading; when he receives a letter from his married sister, Mrs Lawrence, asking him to go to her house, while she is absent with her husband on a few days' visit to an old school-fellow. She admits that she is not quite disinterested in making the request, as she shall feel easier about her two small boys Budge and Toddie, aged respectively five and three, if there is a man in the house; but promises him undisturbed quiet, and leisure for improving his mind.

Mr Burton accepts with alacrity, having a vivid recollection of a lovely house, exquisite flowers, first-rate horses, and unexceptionable claret and cigars; to which the remembrance of the pure eyes and serene expression of his elder nephew (whom he has only seen on flying visits to his sister) lends an additional charm. It occasions him a slight misgiving when the driver of the fly in which he proceeds from Hillcrest Station to Mrs Lawrence's house, alludes to his young relatives as 'imps;' and it is not without some heart-sinking that he meets them on the road, in torn and disreputable garments, each bearing a dirty knotted towel, which Budge promptly informs

his uncle are not towels, but 'lovely dollies.' Mr Burton is self-sacrificing enough to hoist the boys into the carriage; and it is rather hard on him that, just as Toddie raises an awful yell, on being forbidden to try and open a valuable watch, they should meet another carriage containing Miss Mayton, a charming lady, whose presence at Hillcrest, we imagine, may have had something to do with determining Mr Burton's movements. However, the lady is gracious in spite of the dusty and heated appearance of her admirer, caused by his contest with Toddie, and he arrives at his destination in a celestial frame of mind.

He is rather dismayed when left alone with his nephews at the supper-table, feeling that he will get nothing to eat while he is called upon to supply the inexhaustible demands of the two young cormorants; and at the conclusion of the meal he hastily rids himself of them, as he fondly hopes, for the night. Vain hope! As he strolls in the garden smoking a cigar, dreaming of Alice Mayton, enjoying the fragrance of the roses, and above all the perfect stillness of everything around, he is roused from his reverie by hearing Budge's voice overhead, and is met by a demand from a little white-robed figure for 'stories.' Mr Burton is too tender-hearted to resist the wistful expression of Budge's countenance, and he complies; but he fails to compare favourably as a *raconteur* with the absent papa; and Budge assuming the position of narrator himself, gives his version of the history of Jonah. We cannot help laughing at his description of the prophet, who 'found it was all dark inside the whale, an' there wasn't any fire there, an' 'twas all wet, an' he couldn't take off his clothes to dry, cos there wasn't no place to hang em.' Songs succeed to stories, and at length Uncle Harry thinks he is free; but he reckons without his host. Budge insists that his uncle shall hear him say his prayers in the exact manner in which 'papa always does;' concluding his devotions by an immediate and pressing request for candy. But Toddie's prayer must be said first, in which a special petition is offered for the welfare of his 'dolly.' Then, the candy being forthcoming, there arises a clamour for pennies, drinks, and finally for the 'dollies;' which tiresome objects being found, Uncle Harry once more beats a retreat, and settles himself for a little serious reading, experiencing, however, one more interruption from Budge, who appears before him and requests his blessing before he finally turns in. Papa says 'God bless everybody,' persists the boy, when his uncle endeavours to satisfy him with a simple 'God bless you;' and we fully echo Mr Burton's sentiment: 'Bless your tormenting honest little heart, if men trusted God as you do your papa, how little business there'd be for the preachers to do!' The remainder of the night is tranquil enough, for we pass over such minor incidents as shrieks from Toddie for his dreadful 'dolly,' which has been mislaid among the bed-clothes, and the very early rising of Budge,

who is up with the lark, doing his best to rouse his uncle (whose room communicates with that of the boys) from his morning sleep. Who could find the heart to be angry with the small sinner who apologises for his misdeeds by saying: 'I was only a lovin' you cos you was good an' brought us candy. Papa lets us love him whenever we want to—every mornin' he does.'

We draw a veil over Mr Burton's feelings when, on the following morning, it becomes manifest that Toddie (whom his mother believes to have an artistic and poetic soul) has been seized with a passion for investigation, and has dived deep into the mysteries of all his uncle's most precious belongings, the result being—chaos. That after this Mr Burton should insist upon locking the door of communication, can scarcely be a matter of surprise; and accordingly an expedition is made into the neighbouring town to obtain a new key—Toddie having dropped the one belonging to the door down the well—during which the conduct of the two boys is simply angelic. The more spiritual part of their nature comes to the surface; their childish imaginations are impressed by the lovely panorama of the distant city which lies outspread before them glistening in the sunshine; and as the pure young voices speak familiarly of the other world and of the dead baby-brother Phillie who is up there with God, we feel how near those white souls are to heaven. The uncle finds their conversation so improving that the drive is prolonged to the 'Falls,' where, suddenly becoming all boy again, they nearly madden their unhappy guardian, who has turned away for a moment to light a cigar, by hanging as far as possible over the cliff, trying hard to overbalance themselves. As he drags them away, his heart is in his mouth. Budge screams: 'Oh, Uncle Harry, I hunged over more than Toddie did.' 'Well, I—I—I—I—I—I hunged over a good deal *anyhow*,' says Toddie in indignant self-defence. To chronicle all the sufferings inflicted by the two dreadful yet irresistible young 'imps' on their unfortunate uncle, would be impossible. Our deepest sympathies are aroused when he despatches to Miss Mayton a box containing a lovely bouquet, and he finds it is delivered to her containing only Toddie's remarkable 'dolly,' which he has contrived to substitute for the flowers. We groan in concert with Mr Burton when his nephews dance frantic war-dances on his chest, a proceeding which with cruel sarcasm they call a 'froolic'; and our pity follows him through the day, as he is alternately ordered by those imperious young gentlemen to produce candy and pennies, to tell them Scripture stories (the imaginative Toddie evincing a decided leaning towards the ghastly), to sing songs, to cut whistles, and to gather 'jacks,' a plant which grows where there is plenty of mud, and whence they all emerge with their Sunday splendour considerably dimmed, in which condition of course they meet Miss Mayton.

In spite of their incessant mischief, their overpowering activity of mind and body—which must have induced the feeling in Mr Burton of being permanently located on a barrel of gunpowder lighted match in hand—it is impossible not to love the honest little souls, whose worst sins often proceed from the very best intentions; and accord-

ingly we do love Budge dearly, when, on the following day, he surpasses all his previous achievements and covers himself with glory. Uncle Harry announces his intention of taking the boys to see Miss Mayton, and adjourns to the garden to arrange another bouquet, which Toddi is to present as a propitiatory offering. The children take great interest in the proceedings, and learning that Miss Mayton is the destined recipient of the nosegay, Budge asserts that she is 'just like a cake;' and announcing that he 'just loves her,' puts to his uncle the embarrassing query: 'Don't you?' 'Well, I respect her very highly, Budge,' replies that individual; and in answer to his interrogator, explains the meaning of the word respect as applied to Miss Mayton in such fashion, that that dreadfully acute infant comes to the conclusion that 'speak and love means just the same thing.' Mr Burton at this point judges it prudent to break off the conversation, and the trio start on their expedition. The bouquet is delivered without *contre-temps*; Miss Mayton is graciousness itself; and the visit proceeds so satisfactorily that they agree to remain to dinner. Uncle Harry has his misgivings; but beyond the upsetting of the contents of a plate into Miss Mayton's lap, his nephews' conduct is so very blameless, that it is with no feeling but that of lover-like ecstasy, that he finds himself seated in the deepening twilight by the side of the woman he adores, his eyes making confession of his weakness. Suddenly a voice from between them murmurs in sweet tones: 'Uncle Harry respects you, Miss Mayton.'

'Suspects me ! Of what, pray ?' asks the lady.

‘Budge!’ exclaims the horrified uncle—and we can well believe his statement that his voice rose nearly to a scream—‘Budge, I must beg of you to respect the sanctity of confidential communications.’ But Miss Mayton’s curiosity is aroused; and Budge is not to be silenced, even when his uncle explains to her that ‘respect’ is what the boy is trying to say, owing to his endeavour to explain to him the nature of the respect in which gentlemen hold ladies. ‘Yes,’ says Budge; ‘only Uncle Harry don’t say it right. What he calls ‘espect, I calls love.’

After this, what can happen but that the confession should pass from the eyes to the lips? And Budge is forgotten and left out in the cold, until, waxing impatient, he gives his version of how he would behave under the like circumstances: 'I—I—when I loves any one, I kisses them.'

We feel that from this moment the lives of those blessed boys will be made all sunshine by their grateful uncle, and so doubtless they would have been but for one persistently wet day, during which we are sure no mortal power could have sustained Mr Burton, had it not been for the recollection of Budge's recent good deeds. How he lives through the rainy day—how Toddie twice places his own life in imminent peril—how Mr Burton provides employment for his restless nephews—how the artistic Toddie evinces a decided talent for wall-decoration—how he scalds his arm, and devours the curative poultice—and how on the following morning poor little Budge lets us peep into his childish heart and see the yearning for the mother who is away (being comforted by his uncle in a manner which induces us to offer to Miss Mayton our warmest congratulations), we advise our readers to discover for themselves. That Budge

should be the first to inform Mrs Mayton of her daughter's engagement, we, knowing that young man, find only natural; and we are glad to be able to state that it is done with the same tact which distinguished his efforts to bring the young couple together. Toddie once more endeavours to put a period to his existence by swallowing a bottle of paregoric, but is fortunately cured in time to meet his father and mother at the station on their return, by a process which causes him more to resemble the whale than his favourite Jonah.

For a time Mr Burton has been too busily occupied to chronicle any more of the doings of the amusing 'babies.' He has married, bought a house, and settled in the neighbourhood of Tom and Helen Lawrence. We feel sure that Mrs Burton will prove no less admirable than Miss Mayton; indeed, recently breaking silence, her adoring husband has assured us that so it is; but as there are spots on the sun, so do we find that Mrs Burton has one slight weakness—namely, a conviction that she thoroughly understands how to manage 'Other People's Children.' Entirely disapproving of the manner in which her husband had allowed those two ridiculous children to tyrannise over him, and turning a deaf ear to his energetic assertion that all his time was occupied in saving their own lives and their parents' property from destruction, that admirable woman announces her views on the subject of their training. 'You should have explained to them,' she says, 'the necessity for peace, order, cleanliness, and self-restraint. Do you imagine that had you done so, their pure little hearts would not have received it all and acted upon it?' Mr Burton seems doubtful; but his scepticism only makes her rejoice still more in the prospect of speedily having Budge and Toddie under her own hands, during their mother's unavoidable seclusion in her own room on business of the utmost importance. Budge and Toddie presently arrive with the exciting news that there is a new little sister-baby at home, and that they have come to stay a few days. Mrs Burton is determined that her system of education shall begin at once, being anxious to prove its efficacy to her lord and master; but the boys have immediately disappeared, probably in pursuit of the dog Jerry (who has judged it prudent to retire into private life on their advent), and are discovered pickling tomatoes for their aunt by means of 'Mexican Mustang Liniment' and 'Superior Carriage Varnish.' We imagine Budge may have had some reason for his remark: 'I don't think you act *very* nice about presents and surprises.' Toddie spends the morning in a praiseworthy effort to hatch some chickens; but although he sits down 'ever so softly' because he 'hasn't got fessers,' the result is such as to necessitate a visit to the bath-room.

Undismayed by these beginnings, Mrs Burton, on preparing to go out in the afternoon, leaves the boys as it were in charge of the house, appeals in touching words to their sense of the beautiful not to disarrange anything, telling them that people should always try to make the world prettier, and departs with a quiet mind. Whether she thinks her method is attended with unequivocal success when she finds, on her return, that they have acted on her hint, and endeavoured to 'make the world prettier' by manufacturing—of stones, road-dust, and a noxious smelling weed—a fernery

in her best drawing-room (it narrowly escaped being watered), we will not too curiously inquire.

Our author's account of her numerous encounters with Toddie—theological and other—from which she invariably issues worsted, and with increased respect for the force of character which Mr Burton had long since recognised in that young gentleman, is most laughable. She tells the boys interesting anecdotes and stories full of moral purpose, containing hints for their guidance, which the young logicians never fail to act upon in a way which leaves her powerless to reprove (if she does not wish to have her own lessons quoted against her), and with a dismayed sense of failure. She eulogises generosity, and forthwith the boys steal some hot-house grapes from a neighbour with which to present her on her birthday. She gives them lessons on the duty of making others happy, and they try to please her by lighting a bonfire in the cellar; a proceeding which disperses her birthday party. She sends them out of the room with a lecture on being quiet when Uncle Harry has the toothache. 'Even the sound of a person talking is annoying to him,' she says. 'Then you's a baddy woman to stay in here an' keep a-talking all the whole time,' says the irrepressible Toddie, 'when it makes poor old Uncle Harry supper so. Q'way.'

She gives them instruction on the 'duty of working for others, the moral of which is pointed by two small itinerant Italian musicians, who, she informs the children, with beautiful enthusiasm, are doubtless toiling for sick parents who are far away; the result of which lesson on the dignity of labour is, that the two young monkeys perambulate the streets with Uncle Harry's precious violin and a whistle; and earn nearly a dollar with which to buy him a horse and carriage, which they have been told he cannot afford to purchase. It is with a sorrowful heart that Budge complains in his evening devotions that he has 'been scolded again for tryin' to do somethin' real nice for other people;' and that Toddie expresses his opinion that 'Aunt Alish ought to be ashamed of herself;' adding a hope that she may be made so. Poor Aunt Alice is gradually beginning to understand, having arrived at the knowledge by a thorny path, how very little she really knows about the management of other people's children. She tries to find out from Budge why their uncle succeeds better with them than she does, and learns a lesson on the art of making other people happy in their way and not in ours, which she takes to heart, if we may judge by the buns and candy which are manufactured by two small cooks in the Burton establishment, not without many perils to life and property. Perhaps the creature most to be pitied during the visit is the dog Jerry, who suffers many things at the hands of the boys. At all events he seems to be the only rejoicing member of the family at their approaching departure. Aunt Alice begs for another day, in which they distinguish themselves by ascending a precipice to get her a fern as a parting gift. Fortunately a kind Providence watches over them, and nothing worse occurs than a sprained ankle for Toddie. They are returned comparatively satisfied and sound to their father and mother, for whose mercy we should imagine Mrs Burton offer devout thanksgiving.

The last chapter is devoted to a conversation in

which Mr Lawrence favours us with his views on the bringing up of children. Surely he is right when he says that 'love never faileth.'

We feel certain that, to those who have babies like Helen's to manage, and who have wit to read between the lines, these two little volumes will prove as instructive as they are amusing. We can accord them no higher praise.

TEA-CULTURE IN INDIA.

THE author of an anonymous tract printed in 1689, and obtainable gratis 'up one pair of stairs at the sign of the Anodyne Necklace, without Temple Bar,' rather anticipated events in describing tea to be the leaf of a little shrub growing plentifully in the East Indies. No Indian tea found its way to Europe at that time, when haters of innovation were beginning to complain that through drinking of tea Englishwomen were no longer equal to eating beef of a morning. It was not until 1823 that a Scotsman, bearing the historical name of Robert Bruce, discovered there were tea-drinkers in Assam, who brewed their beloved beverage from the leaves of a native tree growing to a height of forty and even sixty feet; of which a few plants and seeds were subsequently carried by his brother, Mr C. A. Bruce, to Calcutta, to excite a transient curiosity, and that was all.

Time, however, brought Mr C. A. Bruce his reward. In 1834 a committee was appointed to consider the question of introducing tea cultivation in British India, and a scientific party under Dr Nathaniel Wallich—a Danish gentleman, whose botanical industry had won him the post of Superintendent of the Botanical Gardens at Calcutta—was sent to explore the newly acquired province of Assam, and make special inquiry respecting the tea-growing there practised. The result was that the committee reported favourably as to the feasibility of cultivating tea in John Company's dominions, Mr Bruce being selected to superintend the formation of government nurseries; and with the aid of Chinese seeds, Chinese plants, and Chinese cultivators, he set the possibility of producing good tea in India beyond all doubt. One consequence of the happy experiment was the establishment in 1839 of the Assam Tea Company, which took over the greater portion of the government gardens, started new ones on a larger scale, set about the cultivation of tea in good earnest, and after various vicissitudes, is now a flourishing concern.

The profitable industry is now fairly established in several of the provinces of the Indian empire, but Assam still maintains its pride of place, being credited with one half of the tea produced; the tea districts of Cochin and Tibet supplying twenty-six per cent., Darjeeling thirteen per cent., the Himalayan districts six per cent., and British Burmah the remaining five per cent. Darjeeling prides itself upon the superior delicacy and aroma of its leaf; but the rough, pungent, malty flavoured product of Assam, which owes its character to the

use of native in place of Chinese seed, is the recognised standard Indian tea. If the Assam planters may congratulate themselves upon overcoming the old-time prejudice in favour of Chinese seed, they have equally good reason to rejoice at having found a way to dispense with Chinese labour, once a grievous necessity. By offering high wages and constant employment, they are able to tempt Bengalese coolies to leave their beloved villages, and by providing comfortable huts with garden-ground in which they can install their wives and families, insure their staying in their new home. That they may not be saddled with useless hands, the tea-growers employ native foremen familiar with the work to act as recruiting officers.

Twelve or thirteen years ago a violent tea-growing mania suddenly set in. Companies were formed by the dozen. The value of available land rose beyond all reason. Some unscrupulous schemers sold uncleared forest-lands as plantations; others, more unscrupulous still, obtained payment for plantations utterly non-existent in any shape, and genuine 'gardens' of forty acres fetched from twenty to thirty thousand pounds. Things have long since found their level again; but the possession of a tea-garden even now presupposes the possession of a capital of at least three thousand pounds, a smaller sum being deemed insufficient to start with, since no return is to be expected from a new plantation for the first three years, and it takes six years for the plants to attain maturity; then they will allow of eight or nine gatherings being made in a year, and yield four hundred pounds of leaves per acre. They improve with age; but planters of seedlings have little chance of seeing their trees at their best, if the Chinese and Japanese speak truly when they say the tea-tree lives to be five hundred years old, and grows better as it grows older.

For very many years after its introduction into England, tea was the subject of a double monopoly. The Chinese were the only manufacturers, the East India Company the only importers. The opening of the trade deprived the consumer of the benefit of the strict supervision exercised by the Company's agents, and left the Chinese merchants master of the situation. A deterioration in the quality of the teas sent into the English market quickly followed; and every reduction in the duty tended to the same end, by encouraging the importation of low-priced leaf of little use save to mix with that of better class; and so it is almost impossible to obtain at any price what those who can remember if call 'old-fashioned tea.' At a late meeting of the Indian section of the Society of Arts, Mr Burrell, after remarking that India produced tea superior to any in the world in flavour, strength, and purity, complained that it was rarely used in this country except to mix with the inferior growth of China; and urged his hearers in their own interests and as a duty they owed to their countrymen in India, who had long toiled and struggled to meet their wants, to a more direct and extended use of Indian tea, and thereby afford a fair harvest of profit to its cultivators, for which nothing was now wanting but an increased consumption of their produce in this country.

Mr Burrell, we think, should rather have appealed to the sellers of tea; for unless they basify themselves in the matter, but few of the millions

of British tea-drinkers can have the chance of tasting pure Indian tea. We are aware that 'the trade' declare pure Indian teas unsuited to the national palate; but we have no faith in their judgment. If dealers in adulterable articles are to be believed, the British public's taste is a monstrously depraved one, preferring chicory to coffee, publican's to brewer's beer, turmeric and flour to mustard, and clever concoctions of all kinds to the things they pretend to be. It may be taken for granted that the Yankee vender of wooden nutmegs was ready to swear his customers preferred the ingenious imitation to the genuine article.

The tea-growers of India, however, have a hopeful prospect before them. The consumption of the produce of their gardens has risen prodigiously, since the arrival of eight chests of tea from Assam caused such a sensation in the London market that the importers obtained from sixteen to thirty-four shillings a pound for it, or an average per pound of twenty-four shillings and sixpence. In 1851 the exportation of Indian tea amounted to 262,839 pounds; by 1863 it had risen to two and a half million pounds; in 1876 English buyers were found for 28,126,100 pounds. Every year sees an increase in the consumption of Indian tea; and unless their Chinese competitors look to it, they will gradually be beaten out of the field, for India possesses vast reserves of land fit for conversion into tea-gardens, and could, if need be, supply the wants of the whole world.

PROFESSOR TYNDALL ON THE SPREAD OF DISEASE.

WE copy the following from our able contemporary, *Nature*. The views propounded have been already noticed in our paper on the 'Germ Theory.'

'In proposing a vote of thanks to Dr Corfield for his recent lecture on Infectious Diseases, Professor Tyndall paid a high compliment to the lecturer for the thoroughly sound instruction which he had so clearly conveyed. He had made it plain that contagion consisted, not of gas or vapour, but of definite particles, sometimes floating in gas, in the air we breathed, or in the water we drank; and that, like organic seeds in the soil, they multiplied themselves indefinitely in suitable media, the great probability being that these disease-producing particles were living things. A close study of the subject, extending now over several years, enabled him to agree entirely with the lecturer in the parallelism which he had declared to exist between the phenomena of contagious disease and the phenomena of ordinary putrefaction. The case of flies, for example, to which the lecturer ascribed the power of communicating disease from one person to another, was exactly paralleled by phenomena in putrefaction. Chop up a beefsteak, steep it in water, raise the temperature a little above the temperature of the blood, pour off the water, and filter it; you get a perfectly clear liquid; but that liquid placed in a bottle and exposed to the air soon begins to get turbid, and that turbid liquid, under the microscope, is found to be swarming with living organisms. By suitably heating this perfectly clear beef-tea, it can be sterilised, everything being killed which is capable of generating those little organisms which produce the turbidity; and by keeping it from coming in contact with the floating particles of the air, it might

be preserved transparent for years. He had now some sterilised beef-tea of this sort which had been preserved for eighteen months in a state of perfect transparency. But if a fly dipped its foot into an adjacent vessel containing some of the turbid fluid, and then into the transparent fluid, that contact would be sufficient to infect the sterilised infusion. In forty-eight hours the clear liquid would be swarming with these living organisms. The quantity of the turbid liquid which attaches itself to the finest needle-point suffices to infect any amount of the infusion, just as the vaccine lymph taken up on the point of a surgeon's lancet spreads disease through the whole body. Here, also, as in the case of contagious disease, there was a period of incubation. In proof of what the lecturer had stated that the contagion of these communicable diseases was not gaseous or liquid, but solid particles, he would describe an experiment he had made only a few weeks since. Eighteen months ago he had a chamber prepared from which all floating particles of dust were removed, and in it he placed a number of vessels containing animal and vegetable refuse which soon fell into putrefaction, and also two or three vessels containing perfectly clear beef-tea and mutton-broth, as transparent as water, in which the infective particles had been killed by heat. Although all these vessels had stood for eighteen months side by side there had been no communication of contagion from one to the other. The beef-tea and mutton-broth remained as transparent as when put in, though the other vessels emitted a most noisome stench. But if a bubble were produced in one of the putrefying masses by blowing into it, and if on rising to the surface and bursting, the spray of the bubble was allowed to fall into the transparent beef-tea or mutton-broth, in two days it became as bad as its neighbours.

'Referring to another point on which the lecturer had insisted—namely, that there was no power of spontaneous generation of the germs or contagion of diseases, Professor Tyndall said that, though at present great names were opposed to that view, he would venture to predict that ten years hence there would be very few great names opposed to the lecturer on that matter. With regard to the power of specific contagia to be generated in decomposing animal matter, he would say that for the last twenty-one years he had been in the habit of visiting the upper Alpine valleys, where, amongst the Swiss chalets, there was the most abominable decomposition going on from day to day, and exceedingly bad smells, but there these contagious diseases were entirely unknown. If, however, a person suffering from typhoid fever were transported there, the disease would spread like wildfire from this infected focus, and probably take possession of the entire population. It might be taken, therefore, that any of these special diseases required its special germ or seed for its production, just as you required a grape-seed to produce a vine. He entirely agreed with all that Dr Corfield had stated as to these diseases 'breeding true.' He never found the virus of small-pox producing typhoid, or *vice versa*. The subject was one of the most important which could engage the attention of the scientific physician.'

FOREIGNERS' ENGLISH.

At all the tourist-towns abroad British visitors are much looked for; and it is amusing to see the mode in which inscriptions and advertisements are drawn up in English, or what is supposed to be English, for the sake of riveting the attention of possible guests or customers belonging to the 'nation of shopkeepers.' Many tourists have taken copies of these curiosities, which have afterwards found their way into print in various forms.

Hotels are famous for these curiosities: the variety of languages spoken by the visitors supplying a reason for this. The 'Drei Mohren' (Three Moors) hotel at Augsburg has the following entry in the visitors' book: 'January 28th, 1815; His Grace Arthur Wellesley, &c. &c. &c.; great honour arrived at the beginning of this year to the three Moors; this illustrious warrior, whose glorious achievements, which, cradled in India, have filled Europe with his renown, descended in it.' At the 'Trois Allies' hotel, Salzburg, some few years ago, mine host invited English visitors by the following announcement: 'George Nelböck begs leave to recommend his hotel to the Three Allied, situated vis-a-vis of the birth-home of Mozart, which offers all comforts to the meanest charges.' The prepositions *at* and *to* are great stumbling-blocks to such concocters of English sentences and phrases; the pronouns *which* and *who* not much less so. An hotel-keeper at Rastadt bestowed great pains on an announcement which with many others was exhibited in the entrance passage or hall: 'The underwritten has the honor of informing the public that he has made the acquisition of the hotel to the Savage, well situated in the middle of this city. He shall endeavor to do all duties which gentlemen travellers can justly expect; and invites them to please to convince themselves of it by their kind lodgings at his house'—signed 'Basil Singisem, before the tenant of the hotel to the Stork in this city.' If the good man had hit upon 'Savage Hotel' and 'Stork Hotel' he would have been a little more intelligible.

The circular of an Italian host, printed in four

languages, discourses thus to English visitors concerning the excellences of the hotel 'Torre di Londra,' Verona: 'The old inn of London's Tower, placed among the more agreeable situation of Verona's course, belonging at Sir Theodosius Trianoni, restor'd by the decorum most indulgent to good things, of life's eases; which are favored from every acts liable at inn same, with all object that is concerned, conveniency of stage coaches, proper horses, but good forages, and coach houses. Do offers at innkeeper the constant hope, to be honored from a great concourse, where politeness, good genius of meats, round table, coffee-house, hackney coach, men servant of place, swiftness of service, and moderation of prices, shall arrive to accomplish in Him all satisfaction, and at Sirs, who will do the favor honoring him with a very assur'd kindness.' No doubt 'Sir Theodosius' took some pride in this composition.

The card of an old inn at Paris some years ago contained the announcement, 'Salines baths at every o'clock;' and of another, 'The wines shall leave you nothing to hope for.' In an hotel at Mount Sinai, on the fly-leaf of the visitors' book, English travellers are informed that 'Here in too were inscribed all whose in the rule of the year come from different parts, different cities and countries, pilgrims and travellers of any different rank and religion or profession, for advice and notice thereof to their posterity, and even also in ovr own of memory, acknowledging.'

On one of the slopes of Mount Etna, at a height of more than nine thousand feet above the sea, is a house built of lava, containing three small rooms and a shed for mules. Up to that point tourists and explorers can ascend on mules, but the remainder of the climb must be made on foot. Hence the desirability of having some building in which mules and muleteers may sojourn for a time, while their hirers or employers are wending their laborious way up to the volcanic summit. When an English force occupied Sicily in 1811, the three brothers Gemmellaro, the most indefatigable of explorers and describers of Etna, obtained from the commanding officer the aid of some of

the soldiers (probably sappers and miners) in building the lava house above adverted to ; giving it, in compliment, the name *Casa degli Inglesi* or 'English House.' Provided with a few humble pieces of furniture, it is placed at the service of visitors, who must bring their own food and fuel with them, and bedding if they wish to pass a night there. The key is kept at a house at the foot of the mountain, the residence (lately if not even now) of a member of the Gemmellaro family ; it must be applied for when required, and returned when done with, accompanied by a signed certificate declaring that the liberal accommodation has not been abused. Printed notices are hung on the walls of the casa in various languages ; one of which, in English, informs English-speaking visitors that 'In consequence of the damage suffered in the house called English, set on the Etna, for the reprehensible conduct of some persons there recovered,' certain regulations are laid down. Visitors, when applying for the key, must give name, title, and country, and must at the same time 'tell the guide's and muleteer's names, just to drive away those who have been so rough to spoil the movables and destroy the stables. It is not permitted to any body to put mules into rooms destined for the use of people, notwithstanding the insufficiency of stables. It is forbidden likewise to dirty the walls with pencil or coal. M. Gemmellaro will provide a blank book for those learned people curious to write their observations. A particular care must be taken for the movables settled in the house. . . . Persons neglecting to execute the above articles will be severely punished, and are obliged to pay damage and expenses.' A significant hint winds up the announcement : 'It is likewise proper and just to reward M. Gemmellaro for the expense of movables and for the advantages travellers may get to examine the Volcan.'

As English travellers will go whithersoever there is anything to be seen, hotel-keepers look out for them near buried cities as well as near volcanic mountains. The following was copied by a tourist from a card for English visitors, prepared by the host of an establishment at or near the excavations of Pompeii : 'That hotel, open since a very few days, is renowned for the cleanliness of the apartments and linen ; for the exactness of the service ; and for the excellence of the true French cookery. Being situated at proximity of that regeneration, it will be propitious to receive families whatever, which will desire to reside alternately in that town, to visit the monuments new found, and to breathe thither the salubrity of the air. That establishment will avoid to all travellers, visitors of that sepulchral city, and to the artists (willing draw the antiquities) a great discordance, occasioned by the tardy and expensive contour of the iron way. People will find equally thither, a complete sortiment of stranger wines, and of the kingdom, hot and cold baths, stables and coach-houses, the whole with very moderate price. Now, all the applications and endeavors of the hoste will tend always to correspond to the tastes and desires of their customers, which will acquire without doubt to him, in that town, the reputation whome he is ambitious.' The landlord's meaning is pretty clear, in spite of his funny English, save in relation to 'the tardy and expensive contour of the iron way,' which however, may have a vague reference to railways.

A refreshment house at Amsterdam sells 'upright English ginger-beer'—the Dutch word for 'genuine,' *oprecht*, having led to a muddling of the English.

Shopkeepers will naturally be as desirous as hotel-keepers to draw the attention of possible-customers who are more likely to read English than any other language. A firm at Marseilles, claiming a good repute for their preparation of the liqueur called *Vermuth*, have labels on some of their bottles to the following effect : 'The Wermouth is a brightly bitter and perfumed with additional and good vegetable white wine. This is tonic, stimulant, febrifuge, and costive drinking ; mixed with water it is aperitive, refreshing, and also a powerful preservative of fivers ; those latter are very usual in warm countries, and of course that liquor has just been particularly made up for that occasion.' It is quite certain that M. Lapresté, a restaurateur at Versailles, said exactly what he did not mean in the following announcement ; by confounding the French *prévenir* with the English *prevent* : 'To Rendezvous of Museum, Arms Place, 9, Lapresté Restorer, has the honor of preventing the travellers that they will be helpt at his house, or a head, or at choice.' The original may usefully be given here, to shew how perplexed the host must have been in his attempted translation : 'Au Rendez-vous du Musée, Place d'Armes, 9, Lapresté, Restaurant, a l'honneur de prévenir MM. les voyageurs, qu'on est servi, chez lui, à la carte ou par tête, au choix.' At Rouen an announcement is remarkable for the odd way of expressing 'London Stout'—namely, 'Stoughtonlondon.' A bath-keeper at Basle informs his English visitors that 'In this new erected establishment, which the Owner recommends best to all foreigners, are to have ordinary and artful baths, russia and sulphury bagnios, pumpings, artful mineral waters, gauze lemonads, furnished apartmens for patients.' A French advertisement relating to a house to be let, with immediate possession, takes this extraordinary form : 'Castle to praise, presently.' Those who know the twofold meaning of the verb *louer* in French will see how this odd blunder arose. A dentist at Honfleur 'renders himself to the habitations of these wich honor him with their confidence and executes all wich concerns his profession with skill and vivacity.'

At Frankfort-on-the-Main, 'M. Reutlinger takes leave to recommande his well-furnished magazin of all kind of travelling-luggage and saddle-work.' Affixed to a pillar outside the Théâtre Français, some years ago, was a bill or placard : 'Hardy Cook, living to the Louvre on the West Gate under the Vestibule, old emplacement of late M. Kolliker. He will serve you with list, and he has parlours and privates rooms, receives Society, and has always some Shoueroute and Distors of Cancall.' Inscrutable words these last, certainly. At Havre, local regulations for the convenience of visitors are printed in various languages ; English people are informed that 'One arrangement can make with the pilot for the walking with roars.' 'Pilot' for 'guide' is not far amiss ; but 'roars' as an English equivalent for 'ramparts' (if that is meant) is odd enough ; and if not, the enigma is just as formidable. The much-used French *on* evidently increased the difficulty of the poor translator.

A Guide to Amsterdam was published in Holland,

in English, some years ago; professing to be written, edited, or translated by an Englishman. Its style may be judged from the following specimen, relating to the manners and customs of many of the inhabitants on Sundays and holidays: 'They go to walk outside the town gates; after this walk they hasten to free public play gardens, where wine, thea, &c. is sold. Neither the mobility remains idle at these entertainments. Every one invites his damsel, and joyously they enter play gardens of a little less brilliancy than the former. There, at the crying sound of an instrument that rents the ear, accompanied by the delightful handle-organs and the rustic triangle, their devoirs are paid to Terpsichore. Everywhere a similitude of talents; the dancing outdoes not the music.'

A Dutch volume containing many views in the Netherlands, with descriptions in three or four languages, claims credit for 'the exactness as have observed in conforming our draughts to the originals, which (a hope is expressed) 'cannot fail to join us the general applause.' Of one village we are told, 'That village was renounced by the abandon of saulmons that were fished there. That village is situated in a territory that afford abandon of fruits and corns.'

A small guide-book for English visitors to Milan cathedral is prefaced by the statement that, 'In presenting to the learned and intelligent publick this new and brief description of the cathedral of Milan, i must apprise that i do not mean to emulate with the works already existing of infinite merit for the notions they contain, and the perspicuity with which they are exposed.'

FROM DAWN TO SUNSET.

PART I.

CHAPTER THE FOURTH.

'FATHER, where do you go away all day?' It was Charlie who spoke, clambering on his father's knee.

'I drive the coach, boy.'

'Coach? An' what is that?'

'Goodsooth, boy, thou hast seen a coach?'

'Ay, father—the coach an' four horses that runs to Grantham. You do not drive a thing like that?'

'Ay. And why not?'

The boy blushed scarlet. 'Why, father, you are Sir Vincent Fleming.'

'An' what o' that?'

'Then is it not against your pride to be a coachman?'

'Poor men must pocket pride, Master Charlie, as thou must learn some day.'

'Well, father, I like it not. Are you so poor, dear heart?'

'Ay, sweet heart, am I.'

'What makes ye so poor?'

'Ill luck, Master Charlie.'

'What in, is your ill luck, father?'

'In all things.'

'Dear heart alive, I'm sorry for ye! When I'm a man, father, you shall go no more a-coaching; I will work for you.'

'Ay, ay, my brave dear lad. I coach to win ye bread. We're poorer than the world thinks. But tell them not this, Master Charlie, or they will dun me.'

'Then I'll dun them!' cried the boy fiercely. 'I

hate those bailiff fellows; if they come here, I'll shoot 'em!'

'We'll fight 'em together, boy. See that thou never hast the bailiffs at thy heels. Here is Deb, Lady Deb by courtesy. Mistress, my rose, say good-morning to me.'

But Deborah was already in her father's arms.

'Deb,' cries Charlie, 'father drives a coach!' Then seeing Deborah's round eyes: 'Now don't you clack, Deb; don't you go an' tell it to all the world, else they will dun father.'

'O me!' Then Deborah's eyes flashed. 'That they shall not—never again! But I tell you, father; I will coach beside you, and try to drive the four brave horses! I will not let you work alone!' Deborah's arms were round her father's neck; she showered kisses on his face.

'Off with ye!' cried Charlie, somewhat fiercely. 'You know that if any one should coach with father, I should—not a baby like to you.'

'Hush!' said Sir Vincent, laughing. 'Thou art ever ready to fight. I have spoiled ye both sadly: so Master Vicar tells me. But Deb, I cannot have thee to help me, little one. Get Dame Marjory to teach thee all the ins and outs of household work, and to trick thyself out bravely, so thou wilt be thy father's pride, my rose of Enderby!'

But Deborah laid her head on her father's breast, caressing him. 'Father, you love Charlie best—Charlie is your darling.'

'Who told thee so, sweet heart?'

'My own heart.'

'Dost love me best, father?' asked Charlie; he pushed his curly head up on to his father's shoulder, and looked up with arch eyes into his face.

Sir Vincent gazed at him. Ay, the father's rose lay upon his heart, his 'Lady Deb,' his darling; but that wilful rogue, that youthful inheritor of all his own wild freaks and follies, that young ne'er-do-weel, Charles Stuart Fleming, the plague of Enderby, was his own soul, the idol of his darkened life. Sir Vincent pushed him roughly away, and laid his hand on Deborah's fair hair. 'Love thee better? No; thou graceless rogue!' he said. 'I love thee both alike. Sweet Deb, thou art my darling too. Now be off with you both; and see that there is no more gipsying or ruffling it while I am away; for Jordan Dinnage shall have orders, if you disobey, to flog ye both with the rope's end; for nought but that, I fear me, will curb the villainy of either one. Good-bye, sweet hearts, an' see that ye stir not beyond the gates.'

The gipsies had vanished from that part of the country; not a trace of them was left; for they knew Sir Vincent Fleming well, and fled betimes. But Sir Vincent had not been gone three hours, when the restless roving Charlie was scouring round the park on his pony, and longing for some fresh adventure and wider bounds. Deborah and little Meg Dinnage were running after him, and urging on the pony with many a whoop and yell, with torn frocks and streaming hair.

'Deb,' cried the boy at last, pulling up, 'I am sick o' this. I am goin' to ride to Clarges Wood, to look for Will; I shall cut across yonder.'

'But you must not!' exclaimed Deborah; 'you have promised father not to go beyond the gate.'

'I have never promised that,' said Charlie hotly;

'father asked me no promise, an' I gave none. It is nothing o' the sort.'

'Nathless it was a promise,' quoth little Deborah stoutly, glancing from Charlie to Meg Dinnage, and back in distress; 'for we said nought when father said: "An' see you stir not beyond the gates;" but I kissed him, an' I said: "I will not."'

'You did not say that, silly!'

'Nay, but to my own self I said it. Father has trusted us; so Dame Marjory says.'

'I care not for Dame Marjory. I gave no promise; nor am I afraid of a rope's end. If Jordan Dinnage beat me black an' blue, I'll go! But I'll not see Jordan till father comes home. Father loves me too well to have me flogged when he is by;' and with a laugh, Charlie turned his pony's head; but Deborah sprang after and caught the rein. 'Charlie, Charlie, stay!' she cried; 'father has trusted you to stay!'

But Charlie was across the boundary and far away; his laughter echoed back. Deborah flushed, the tears almost started as she gazed after him, but she kept them proudly back. Little Mistress Dinnage went up to her playmate and took her hand ('Mistress Dinnage,' as she was called for her little upstart ways and proud independence) and eyed Deborah curiously. 'Don't cry,' said she. 'Cry!' echoed Deborah scornfully; 'I'm not cryin'.'

'He's a bad boy,' said Mistress Dinnage gravely, with a nod of her head that way.

Deborah half rebelled at that, then: 'Charlie has broken his word!' and she flushed again. 'God will never love Charlie. The evil one will take Charlie to the bad place;' and the bright eyes glistened, but again the tears were stifled back.

'Not if my dad beats him,' said Mistress Dinnage consolingly; 'then he will be a good boy, and God will love him again.'

Deborah shook her head. 'Ah, Charlie will only be bad the more. He laughs at Master Vicar, and cares for nought. But don't tell your father, Meg, that Charlie's gone away; he will not be good the more for that; God will not love him better. Charlie must himself tell father, and that will make it right. So see that you don't tell Jordan, dear, for I am afraid to see my brave one beat; I had rather have Jordan beat me than him; it makes me *fear* to see Charlie beat.'

'An' me too,' said Mistress Dinnage, with infinite relief. 'We will not tell on Charlie; Charlie would call us "Sneak." Come an' play.'

And the two, putting aside their sorrows, cast care to the winds and danced away.

CHAPTER THE FIFTH.

A year or two have passed and there was joy in the bells of Enderby, and joy in the sun and flowers. Winter and summer, storm and sun, how sweetly the days fled by—the wild sweet days of childhood. The streams; the dark green woods; the blue and cloud-swept skies; the clear lagoons; the carol of birds in the gay early morning, from wood and field and holt; the father's call beneath the window, and then the long, long sun-bright day; the games; the 'make-believes'; tracking the wild Indians in the forest, hunting the chamois on the mountains—happy days, these!

Time passed on; Charlie was alternately sent to a public school and to a private tutor; he was expelled from the former, and ran away from

the latter. The tender, but proud and stubborn heart was never reached; so the dogged will and headstrong passions remained uncurbed and uncontrolled, and Charlie Fleming too surely went from bad to worse. Three distracted governesses in succession gave up Lady Deb; their reigns were short and eventful.

Upon a certain day stood Deborah Fleming, watching for Charlie's coming. For a week past Charlie had daily ridden over to the neighbouring university town to 'read' with his cousin Kingston Fleming, who had just entered there, and being somewhat of the same stamp as himself, imagine how much 'reading' was accomplished! The lads came and went at all hours; sometimes at Enderby, sometimes away. To-day they were late. Deborah was weary. She wandered into the garden, between the high sunny walls, and threw herself on the warm grass amongst the daisies; she plucked a daisy idly, and grew intent over it, flippin' away the leaves: 'He loves me, he loves not me!' and so forth. While thus musing, a tall fair youth, with a face browned by sun and wind, stole behind her, his whole countenance brimming over with merriment. Deborah instinctively turned her head. All her heart's blood rushed over her face, and her gray eyes flamed and dilated like a stag at bay; for one moment she glared at the youth, and then, before he could speak, was up and away. A peal of laughter followed her as she fled.

'Hi! what's the matter, King?' cried Charlie Fleming, swaggering up in his riding-gear. 'What is the cause of this immoderate laughter? Deb has flamed by me like a whirlwind; I tried to catch her.'

Still, for some moments, Kingston Fleming shouted with uncontrollable mirth, rolling on the grass. When he could speak, he said: 'You will never guess, Charlie! Yet it is a shame to tell you. And yet it is too rare a joke to keep! *Little Deb hath got a lover!*' And with that, Kingston went off again.

'I came up unawares,' said he, 'an' my Lady Deb sat on the grass. "He loves me, he loves not me!" she said; not like Deb proud and haughty, but quite tender and subdued over it. She turned and saw me. Egad! how she blushed, and what a glare! Poor little Deb, she was distraught for shame and anger. I was a brute to laugh!'

'I will roast her,' said Charlie. 'Deb a lover? Ha, ha, ha!'

'No; you shall not speak of it,' said Kingston, laying a heavy hand on Charlie's shoulder. 'On peril of your life, you shall not.'

Charlie laughed. 'Under that threat I must succumb. Perchance Deb has a sneaking liking for you, old King!'

'For me?' And Kingston had a fresh fit of laughter. 'Nay; Deb hates me like poison, and I think her the maddest little fury that ever stepped. Deb and I shall ne'er run together.'

But as for the maiden, she fled to her room like a little tempest, and lay along the floor half dead for shame. She could scarcely think, for when she thought, the blood rushed in eddying torrents to her head, and made her mad for anger and for shame; for more than aught on earth, was Deb shy of the dawn of love and Kingston's raillery. All day she kept her room. She watched from behind the curtains Kingston and Charlie ride away; she

had not kissed Charlie that day or spoken to him; she heard him call out 'Good-bye, Deb.' Then he would not return that night. O Charlie, Charlie! And then she peered out, and heard Kingston's laugh, and saw his fair hair blown by the wind. The girl leaned out and watched them through the gateway. 'I love him,' she said to herself with mingled fire and softness; 'I love Kingston. But he will love me never—never!'

Kingston laughed no more about Deborah's daisy: he was generous. The next day he was teasing, laughing, tormenting about a hundred things; and the child Deborah was chaffering and defying him in the wildest animal spirits. Dame Marjory shook her head; there was such a flying, scurrying, shouting, and such peals of laughter, not only from those three, but from the usually demure Mistress Dinnage who joined them, that the Dame could make nothing of them; they got worse and worse. Kingston Fleming was a wild youth, not one indeed calculated to steady his kinsman Charlie. Yet Kingston had good, and even noble impulses in those days: he was ambitious too; and at odd hours and by fits and starts, he worked hard, with the idea of fulfilling those ambitious dreams. But Charlie never worked at all; his dreams, if he had any, were not known. Himself caring little for any man, who cared for Charlie? Why, all who knew him loved him; they could scarce tell why. Old Jordan Dinnage, who had given him many a rough hiding, idolised the boy; young Margaret Dinnage, who had received many a rough word from him—well, young 'Mistress Dinnage' did deign to open the gates to Charlie Fleming's horse, though she would do so with a toss of her head and an assumed air of disdain. The maiden resented even then, though still a child in years, the full-blown compliments of the lad Kingston; but would redden, and her dark eyes would glow, when the boys passed by, if she only met the swift, shamed, furtive glance from two full red-brown eyes—the eyes of Charles Fleming.

On sunny mornings, when the lads rode unexpectedly into the courtyard of Enderby, there would be a whirr-r-r of pigeons, lighting on the gabled roof; a blaze of sunshine on the great wych-elms; a murmur of bees; a smell of fruit and flowers; white-haired Sir Vincent standing in a stable-door; over the garden wall, Deborah and Margaret flying along the garden walk with arms linked in the 'maddest merriest dance,' set to the music of boisterous laughter. Those were happy days.

PART II.—NOON.

CHAPTER THE FIRST.

'Hath he gone, Lady Deb? Hath Finton gone?' It was Dame Marjory who spoke, treading cautiously as she entered the young mistress's presence. Deborah tossed her head, and gave a short laugh. 'Ay; he blustered, though. It is the third time he has come to dun father. My dame, these are hard times; but all may yet be well. Look you, I have saved so much for father; if Finton could see it, how his eyes would glitter like a wolf's. I hate that man; I hate all money-hunters. I care not if it be the law or not; it is

dirty work! Take you this gold, dame; hide it well, lest I covet to buy a new gay scarf like Mistress Dinnage's. Away with it! and let me see the stuff no more.'

Dame Marjory took the gold, but she looked back over her shoulder, and her old eyes gleamed: 'Thou to want for what Jordan's daughter has for askin'!' she said. 'What right has Mistress Dinnage to flaunt in silken scarfs—and my child, my mistress, my lady "rose o' Enderby" to pine and pine? My child!—and the old woman faced Deborah, and the hot fierce tears welled into her eyes—'I was wont to dress thee better than a queen; now, look at thy dress! What right, what call hath Sir Vincent Fleming's daughter to wear such dress as thine? A gipsy hag would scorn it! An' thy poor mother would have cursed the day that saw thee in this strait.'

'Hush, Marjory—hush!'

'I will not hush! It is thy father's an' thy brother's sin. I will not hush! O child, child, my heart is harried for thee!' And the old woman fell from her vehemence, and began to weep most bitterly.

Deborah softened at that; she flew to her nurse's side in wonderment, and knelt at her feet in tender trouble. 'Dame, dame!' she said, 'it is not thy habit to give way to tears—and all for me, for me, dear dame, who am not worthy to have thee shed a tear! Hark! Do you think I care to flaunt in silks? Do you think indeed Sir Vincent Fleming's daughter would wear fine feathers while he owed a penny? You might then weep for shame. But I am too proud for that. Now kiss me; and do not weep, oldest, truest friend. I cannot have thee weep!' Impossible to describe the tenderness of tone in those last words. Some thought Deborah Fleming cold, hard, haughty; they would not have thought so then.

Left alone, the girl resumed her gay debonair air. She gazed at herself in one of the long mirrors; she smiled and courtesied low, in mockery; then drawing herself up, she gazed again. Now Deborah would utter her thoughts aloud; it was a way she had. Regarding herself, she said: 'Nay; you are not fit; you cut a sorry figure in the world. She says truly. Yet what would you have me do? Beg borrowed plumes? Use ill-gotten gains? Would Deborah Fleming be the fairer for that? The fairer, perchance, but not the nobler. Oh, you are a sorry bird, Deb! The old barn-hen has a richer dress than you.' Then again, jerking her head upward once, twice, thrice: 'No wonder Kingston Fleming does not love you. "Master Kingston Fleming!" she added—and her lip curled with superb scorn—'loves fine dresses and silk shoes. He loves to see "beauty go beautifully." I am not a "Mistress May" or "Mistress Blancheflower." With that, Deborah shot off all her satire; and laughing, tripped from the room.

In a few moments more she was running with the fleet foot of her childhood across meadow and holt, gay as a skylark. Presently she stopped, for in her course, with her back to a tree, stood a tall gipsy woman, with a red and yellow scarf upon her head. 'What do you here?' asked Deborah haughtily. The old scene in the camp came back; the fugitive retreat at night; she and Charlie and the old beldam huddled in a covered cart together;

and outside, the tramp, tramp of horses and of men, and the mysterious jingle of pots and kettles, and the angry blows received from the old beldam for the noise she and Charlie made. The gipsy too recognised Deborah: this was not the child, though, who eyed her through the gate, but a proud imperious lady. In spite of the plain rough dress, the woman, with the nice discernment of a peasant and a gipsy, knew the lady, and the Lady of Enderby to boot. With unabashed impudence the gipsy stepped forward: 'I was waitin' to see ye, pretty lady.'

'And what do you want with me?' asked Deborah. 'This place is not for such as you. Honest poor folk may seek me here, and welcome; not gipsy vagabonds and thieves. If you have a petition, refer it to the back door and the cook, not to Mistress Fleming.'

The woman turned aside her head; for the moment her dark face was distorted by impotent rage and passion; but when again turned on Deborah, it was calm. She darted forward and clasped her hands, for Deborah was passing on.

'I am no thief,' said the woman, with shortened breath. 'I am an honest woman, lady, an' honestest than many folk that live in great housen, like yonder. Pretty lady, don't be so hard on the poor gipsy. I've had troubles I tell ye, to which yours are nought—an' I don't ask yer pity.'

'Then what do you ask?' asked Deborah, turning full upon her.

'Yer hand—to let me see yer hand.'

'For the sake of gold! I have no gold to give you.'

'Nay, for no gold,' said the woman eagerly; 'but to read yer fate. A silver piece will do it. There! I will tell ye yer fortune for that.'

'And to what end? Have you an interest in me? in one whom you would have gladly lured away to a life of sin and misery? or as a hostage for my father's gold? You have done me grievous wrong. You take too much heed by half to the interests of the Flemings, woman; it is for no good.'

'Yes,' said the gipsy, in a strange low tone, 'I take interest in ye, but *more* in yours. Lady, let me see yer hand. I tell ye I have interest in yer fate, and in the fate o' one yer soul loves. Come!'

'You shall not wheedle me into it,' said Deborah. 'If I consent to let you, it will be of mine own free-will and after thought, not from words of yours. Some tell me it is vain; some say that fortune-telling sells you to the evil one—that it is grievous sin to seek your fate by signs and stars. I am not of these opinions.' The girl seemed talking to herself; the gipsy watched her keenly.

'Yes,' said Deborah, looking up and full at her, 'you shall tell my fortune. But can you trust me for the money?'

'Yes.'

'And why?'

'Because ye can't tell a lie.'

'That is well. I believe in witchcraft; this is why I hear you. Had you not come here, I would sooner or later have sought you, because time is slow, is slow, woman, and I want to know my fate! I will not say God forgive me: it seems almost mockery to ask forgiveness on what my heart knows to be wrong.'

'*Wrong, lady?*'

'Yes, wrong!' cried the maid, striking her foot

on the ground. With that she held out her hand, a pink palm and tender lines, for the witch-woman's mystic reading. They both stood silent—the gipsy gazing downwards; Deborah gazing on the weird countenance before her, while the rich blood spread and deepened on her own with timidity and with shame. 'What do you see?' asked Deborah at length, with curling lip. 'I scarce believe you; it seems too vain!'

Then answered the gipsy woman, in low strange tones: 'You will be a great lady yet—ay, greater than Mistress Fleming. Ye will not go far to find yer greatness, either—it will meet ye at yer own gates; love and greatness will come hand in hand.'

Deborah's eyes sparkled. Then she said: 'Woman, that cannot be!' Then with the blood mounting to her brow like flame: 'What did you say—of one whom my soul loves? Who is he?'

'A fair tall youth. I know his title; but the title, look ye, will never be yours.'

'Then I care for nought!' said Deborah Fleming, and she flung away the gipsy's hand. 'Your craft is wanting. It is a vain, lying, deceitful craft! Look ye, Deborah Fleming will never be your great man's wife! You lie! I love power and riches; but I scorn them as you would foretell them to me. Gipsy, I have had enough of your fortunes and of you!'

She was gone—that proud young Mistress Fleming, whose will had never been crossed or curbed; tall beautiful young ash, that would yield neither to breeze nor tempest, but held its head so high.

The gipsy gazed after her; fierce passions made the woman's breast pant. 'I hate her!' she gasped between her clenched teeth—'I hate her! I hate all thy black race, my lass. But ye shall lick the dust, proud Mistress—I see it on yer palm. Ye shall have the pale-faced sweetheart, but it shall be across ruin and disgrace; an' by settin' yer foot on the two dead bodies o' them ye love like yer own soul, ye shall climb to yer lad. Take him! I wish ye joy o' him then! I care not, so long as I ha' vengeance, vengeance, vengeance!' and the wild woman's eyes glared with a fire like madness. She turned towards Enderby, and shook her clenched fist that way. 'I will have vengeance then, for all the dark hours thou hast caused me, pretty daughter o' mine! I will see thy boy dabbled in his blood; an' may thy dead eyes be opened to see it too. Heaven's malison light on thee!'

THE ROYAL NAVAL RESERVE AND ROYAL NAVAL VOLUNTEERS.

WHENEVER England is engaged in a naval war or any war including maritime operations on an extensive scale, a difficult problem has to be solved—how to man the ships? In the army, every regiment has a sort of corporate existence; it never dies—the exceptions, the actual disbandment of a regiment, being very rare indeed. The number of men varies according to the peace-footing or the war-footing at which the regiment may stand at any particular date; but at all times many hundreds of trained men belong to it. Not so in regard to a ship of war. When not wanted for warlike, cruising, or other service, it is 'out of commission;' all the officers and men are

paid off; and the ship, moored at Portsmouth or some other naval station, is stripped of most of its paraphernalia, ammunition, and stores, and 'laid up in ordinary,' with a few dockyard or harbour men to take care of it. When wanted again for active service, it has to be 'put in commission' again; commissioned officers and crew have alike to be engaged anew, just as though the ship were fresh from the builder's hands. Officers are always plentiful enough, the number on half-pay in peace-time being very large—nearly the whole of them desirous of engaging in active service on full pay. With the sailors, the A.B. (able-bodied) and common seamen, the case is different; competition for their services being kept up by the owners of large commercial vessels.

The difficulty of suddenly obtaining a large additional number of seamen was seriously felt at the commencement of the Crimean war; but the Admiralty solved the perplexity by organising a *Royal Naval Reserve*, and obtained the sanction of parliament for the necessary outlay. The Reserve was to comprise men who, provided they attend drill a certain number of days in each year, may follow any avocation they please at other times; it being a well-understood matter of agreement that they shall be ready for active service on the breaking out of war. Of course ship-owners did not at first relish this scheme, seeing that it established a new kind of competition against them for hands; but in practice no particular inconvenience has resulted. The men are permitted to take their drill whenever it best suits them; twenty-eight days per year all at one time, or in periods of seven, fourteen, or twenty-one days. Certain qualifications are insisted on before enrolment, including a medical examination in regard to health. The 'retainer' which the seaman receives, and the prospect of pension, operate as inducements to steadiness and against desertion; and it is known that this is exercising a beneficial effect on the mercantile marine, seeing that ship-owners now give a preference to Royal Naval Reserve men whenever they can get them. Mixing with the regular men-of-war's men during the one month's drill is also found to be beneficial; and some of the Reserve go through all their exercises with as much steadiness as a regular crew. The Admiralty are empowered by parliament to engage thirty thousand men in this way; the Reserve now comprises twenty thousand; and it is believed that there would be no great difficulty in making up the full complement.

In a recently published Report by the Admiral Superintendent of the body, the following remarks occur: 'After all the expense the country has been put to, and will have to bear prospectively, for the organisation and maintenance of the Royal Naval Reserve, will the men be forthcoming when wanted? This can only be tested in the day of trial, when the Queen's Proclamation will call the Reserve out for active service; but I hold that we have as reliable guarantees that the men will present themselves, as under any system that could be devised on the basis of voluntary service. The men have entered on an engagement to serve, they have received drill-pay and retainers under this engagement, and without being branded by public opinion, could not shrink from the fulfilment of their duty. It would be doing an injustice to

the *élite* of the merchant service to suppose that they are entirely devoid of patriotism, and would not desire to serve in defence of their country. Their prejudices against service in the royal navy have been in a great measure removed; and they would feel themselves competent from previous training to work the guns and handle a rifle and cutlass.'

Very little has yet been done to take the Reserve on a cruise for rehearsal or practice. A merchant seaman, to fit him for the Reserve, requires chiefly to be made familiar with the great-gun exercise, to handle the sword and rifle, to be steady and silent under instruction, and to obey implicitly the orders he receives. This training he will receive on board the drill-ships especially set apart for the purpose, or at batteries representing the section of a ship, quite as well as in a man-of-war. The Reserve of the first class (for the force is divided into classes) have already been seamen in the merchant service, and do not require instruction in seamanship.

The drill-ships and the practice-batteries are distributed pretty well around the coasts of the United Kingdom at about forty different stations—eight in Scotland, seven in Ireland, and the rest in England and Wales. There are nearly always some men on drill at every ship and battery; but it is noteworthy that in the fishing season in certain parts of Scotland and in the Isles the drill is pretty nearly in abeyance—herrings being more important just then than big guns and cutlasses. The first-class men are far more numerous than the second, shewing that the main body are already fairly good seamen before they enter the Reserve. As to numbers in different places, the drill-ships near busy ports are naturally more frequented than those off a thinly populated coast. The *President* in the Thames, the *Eagle* at Liverpool, the *Unicorn* at Dundee, the *Netley* at Inverness, the *Castor* at North Shields, the *Dardanus* at Bristol, are among the drill-ships which receive the greatest number of enrolled men for drill during the year. Liverpool takes the lead in the number of outsiders (seven-eighths of whom, however, are already merchant seamen) who apply for enrolment. Half the whole number in the force are under thirty years of age, young men with plenty of health and strength in them. Rather less than half are at home or in the coasting-trade; rather more than half voyaging in foreign seas, mostly, however, on short voyages that will end within a month. More of these voyages are to the Baltic and the North Sea than to any other waters; the next in numbers are those to the Mediterranean and the Black Sea.

The officers who command or control the body comprise lieutenants, sub-lieutenants, engineers, assistant-engineers, and midshipmen. The lieutenants must have served as sub-lieutenants one year or upwards; most of them have been duly qualified masters of merchant-ships. Midshipmen are promoted to the rank of sub-lieutenant on the fulfilment of prescribed conditions as to efficiency, &c.

The men of the first-class now receive a grant of a suit of clothing on enrolment and re-enrolment—an arrangement which they much relish, as an improvement on the plan at first adopted, when each man was left to dress pretty much at random, provided he looked something like a sailor. Nearly all the A.B.s in the mercantile marine have joined

or offered to join the body; thus affording proof that it is popular. The second-class Reserve are mostly fishermen, who are unacquainted with square-rigged vessels, and are unaccustomed to long absence from their homes; but they are fitted for coast-defence service. In Scotland and especially in the Shetlands, the second-class serves as a stepping-stone to the first. Their pay is less than that of the first-class, and they have no claim for pension; therefore they have an inducement to try for promotion. The authorities have had under consideration the question whether to establish a third-class, to consist of boys belonging to the mercantile training-ships; but no decision appears at present to have been arrived at.

In a discussion which took place at the Royal United Service Institution some time back, it was generally admitted that our band of hardy fishermen might be made to form an excellent Naval Reserve irrespective of regular seamen of the mercantile marine. 'There are,' it was urged, 'one hundred and fifty thousand men and fifteen thousand boys employed in the fisheries of the United Kingdom; besides the large number in the Canadian Dominion and Newfoundland. It would not be difficult to raise from among our large population of *bona fide* fishermen a Reserve equal to the full standard originally recommended. The drill could be taught in the most efficient manner and with the least expense to the government by sending a gunboat to visit the fishing-boats at the slack season. The local knowledge possessed by the fishermen would be of immense value in coast-defence; and there is an advantage in their having fixed places of residence and never sailing under a foreign flag; added to which is the value of their physical strength, hardy and domesticated habits, and good character.'

And now a few words for the *Royal Naval Artillery Volunteers*, another body intended for defensive purposes in the event of war. There is a corps known as the *Coast Guard*, to fulfil service on the coast in case of invasion; and under the same kind of control are the *Royal Naval Coast Volunteers*. These two bodies together comprise nearly twenty thousand men, all good seamen, and receiving liberal pay. But there is something more peculiar about the *Royal Naval Artillery Volunteers* likely to interest general readers. They are virtually an offshoot or supplement of the Volunteer Rifles, intended solely for defence against invaders. Who the invader is to be we do not know; haply and happily we may never know; but a thought on the subject now and then is reasonable enough. Our coast-line is very extensive, and needs watching at a considerable number of unprotected spots. Besides regular troops, Volunteer infantry, and cruising war-ships, it has long been felt that a naval artillery corps would be a useful addition for serving in gunboats and mortar rafts, and operating in the new art of torpedo-defensive warfare. A small Marine Volunteer Corps was raised at Hastings about 1863; others were afterwards raised in London, Liverpool, and Bristol; and at length, in 1873, parliament passed an Act sanctioning the formation of a body to be known as the *Royal Naval Artillery Volunteers*. So far from being men who are paid for their services, these Volunteers have to provide their own uniform and to pay a small subscription to a corps fund; they really enter into the matter *con amore*,

giving time, exertion, and some money for a purpose which may eventually be valuable to our common country. The government provide ships, great guns, rifles, pistols, cutlasses, and other gear for practice. Whether artisans, yachtsmen, or rowing-men would join the corps in any considerable number, could only be known by awaiting the result; but it turns out that clerks—mostly in commercial firms—come forward more readily than any other class. They like the bodily exercise and the open air after many hours of desk-plodding.

The idea is to render these Volunteers handy in the defence of rivers and estuaries, by the management of floating-batteries, armed rafts, and torpedo-boats. In practising with big guns at such places as London, Liverpool, and Bristol, there are of course neither real shot nor blank cartridges actually propelled from the weapon; a flash and a slight report are all; to run out, point, fire, and re-adjust are the exercises practised; and this is no small work with a sixty-pounder gun. After this big-gun drill, the Volunteers go through their rifle, cutlass, and pistol drill; and the young men are all the better for two or three hours of muscular exercise and ocular training. They wear a useful blue-and-white uniform while thus engaged. The *Rainbow* gunboat in the Thames off Somerset House, the *President* in the West India Docks, and two similar vessels at Liverpool and Bristol, are set apart by the Admiralty as drill-ships for the purpose. The total strength is somewhat under seven hundred men, with a naval instructor, petty-officer instructors, lieutenants, sub-lieutenants, shipkeepers, armourers, &c.

Even if never really wanted for river and estuary defence, these energetic young men will have no reason, bodily or mental, to regret the step they have taken—the devotion of a couple of hours occasionally after office or warehouse time to a right good exercise of muscle, nerve, brain, eyesight, attention, and intelligence. It is a national comfort to know that rifle and artillery volunteering are alike free from many of the evils of young men's recreations; they do not tempt to drinking, to betting, nor to dissolute companionship. All honour to those who promoted, and to those who carry out the movement.

TIM HARGATON'S COURTSHIP.

HE was mother's factotum, big Tim Hargaton. I do not know how she could have managed the farm without his clear head and sound judgment to guide her. He had the name of being the closest hand at a bargain and the best judge of a 'baste' in Innishowen; and I think he deserved it; for mother very rarely lost upon her speculations in cattle, and our animals were famed for their beauty. Tim was not wholly an Innishowen man. By his mother's side he claimed descent from the Scottish settlers of the opposite coast, and much of his cautiousness and shrewdness could be traced to this infusion of kindly Scottish blood. We children had rather an awe of Tim. He ruled the outer world of our homestead with a rod of iron. Woe betide the delinquent who ventured into the garden before the 'house' had been supplied with fruit for preserving! Woe be to us if with profane hands we assaulted his beloved grapes or ravaged his trim flower-beds! I daresay it was very good for us that some one

was set in authority over the garden and farm-yard, for we were allowed quite enough freedom indoors, fatherless tomboys that we were. But years passed by; one by one we grew to womanhood. I, the eldest, left home first—to return first; more alone for having been so happy, too happy for a little while. When I returned, a widow, the younger birds had flown from the nest. Mother had no one left but me, and she was growing old; so I cast in my own and my boy's lot with her, and soon became thoroughly acquainted with Tim Hargaton. To him I was 'the young mistress' or 'Miss Ellen'; and I own I felt often at a disadvantage with him. His quiet knowledge of subjects I was utterly ignorant of, his cool rejection of my farming theories, his almost certain success in all his ventures, overawed me; and after a struggle or two I gave in.

I think Tim must have been about forty at this time; but he looked many years younger, being fair and tall and well made, and—a bachelor. He had a merry twinkle in his gray eyes which almost contradicted the firm-set mouth with its long upper lip and square massive chin; from his half-Scotch mother he derived a close calculating disposition, hard to convince, slow to receive new impressions, strong to retain them when once received. From his father roving Pat Hargaton from Donegal, he drew an Irishman's ready wit and nimble tongue, and under all an Irishman's fickle heart, but not his warm affections, which go so far towards amending the latter fault.

Another unusual thing amongst men of his class, he was well to do, and having successfully speculated in cattle on his own account, he had money in the bank and a snug cottage. Yet year after year, Shrove-tide after Shrove-tide—the marrying season all over Roman Catholic Ireland—found Tim rejoicing in single-blessedness; nor could he have had a comfortable home, for his old mother was a confirmed invalid; and as Tim was reported to be 'a trifle near,' he only afforded her the services of a little girl scarcely in her teens. More than once mother spoke to him about matrimony, and as often Tim met her with the unanswerable argument: 'Is it as easy to peck for two as for one, ma'am?' So she ceased bothering him about it.

Now it befell that one bright frosty November day I had despatched Tim to the county town on very important business; and the better to assure myself of the favourable issue of it, I walked to meet him on his return. As the time of his return was overdue, I began to feel rather uneasy, and quickened my steps along the winding sea-side road; but a turn in it soon revealed the reason of Tim's delay. He was walking beside a very pretty country lass; and another, not so young or nearly so pretty, lagged a little behind.

'O ho, Master Tim!' I thought; 'are we to hear news of you this Shrove-tide?'

As I came forward, the girls fell back, Tim hastening on to meet me. He looked shy and sheepish enough as he advanced; and the pretty lass, whom I at once recognised as Mary Doherty, the acknowledged belle of the barony, hung her shapely head in blushing confusion as she passed me by.

Tim was all business and stolidity once the girls were out of sight. He had lodged money for me in the county bank; settled my own and mother's

accounts with butcher, baker, and grocer; transacted all our various businesses with care and correctness; and having given up his accounts into my hands, he hurried on, whilst I continued my walk. Twilight was falling when I returned home; but although more than an hour had elapsed since Tim had preceded me on the road, he was just entering the gate as I turned from the sea-road for the same purpose. I made mother smile that evening when I told her of my encounter.

'But,' she said, 'poor little Mary has no fortune. Tim will look for one with any girl he marries.'

A few days afterwards Tim took me into his confidence. We were making our winter arrangements in the green-house, putting away summer plants whose flowering days were done, and filling up gaps in our shelves with bright chrysanthemums and other winter-blooming plants. An hour sufficed to weary mother at this work, so Tim and I were left alone amongst the flowers. For some time he worked away in silence, but I could easily see he was longing to speak, and so I determined to give him an opportunity; but he forestalled me.

'Twas a fine day the day I was in Derry, Mrs Grace,' he said, as he passed me carrying a huge coronella from one end of the greenhouse to the other.

'It was indeed, Tim. Had you many people on board the steamer?' I replied.

'No, ma'am; not to say very many. Them officer-gentlemen from the Fort.'

'Had you any of the people from about here?' I asked.

'Hugh Doherty and his sister, and Susie Connor, ma'am.'

'Ah, you walked home with the girls. What became of Hugh?'

'Troth, ma'am, he just got overtaken with a drop of drink, and I thought 'twas but friendly to see the girls home.'

'I am sorry to hear Hugh was so bad as that, Tim.'

'Well, sorra much was on him, Miss Ellen, but he was loath to quit Mrs Galagher's when we got off the boat, so we just left him there.—Hem! Miss Ellen, I've a thought to change my life.'

'I am very glad to hear it, Tim.'

'Yes, miss' (Tim always forgot my matronly title in confidential talk)—'yes, miss. 'Tis lonely work growing old with nobody to take care of you.'

'That is a selfish way of looking at things, Tim,' I replied.

'Begorra, miss, what else would a man marry for but to have himself took care of?'

'I suppose liking the girl he married would be a kind of reason too,' I responded.

'O ay. I'd still like to have the one I'd fancy, if she was handy.'

'And who are you thinking of?' I asked, as Tim bent over a box of geranium cuttings. 'I hope she is nice and good, and will be kind to your poor mother, and a good manager?'

'Faith, I wouldn't take one that wasn't that, Miss Ellen,' he replied, without raising his head. 'But it's hard to tell how these young ones'll turn out.'

'She is young then?'

'Young enough, and settled enough,' he responded. 'There's two I'm thinkin' of.'

'Two!' I exclaimed. 'Why, that is not right of you, Tim. You are surely old enough to know the kind of wife would suit you best; and it is unfair to the girls. They are relatives, if I guess right. Those two young women you were walking with on Saturday?'

'Just so,' replied Tim, utterly unabashed: 'Mary Dogherty an' Susie Connor. Mary's the *purtiest*,' he added in a half soliloquy.

'I have always heard she was as good as she looked,' I said. 'She has been such a dutiful daughter and good sister to those wild boys, she cannot fail to make a good wife.'

'Maybe,' quoth Tim. 'But the Dogherties is down in the world these times.'

'I know they are not very rich; but they are comfortable.'

'They aren't begging, miss, axing your pardon; but musha! it's little softness there's about the house.'

'Well, suppose she has known what it is to want, she will know better how to take care of plenty, when she gets it.'

'Troth, I don't know. Maybe when she'd get her two hands full she'd be throwin' away, for them that's reared in poverty seldom knows how to guide plenty when it comes.'

'Well, I have always heard Mary extolled for being the prettiest and the best girl in Innishowen; and I am sure you may think yourself a happy man if you can get her for your wife,' I said rather sharply.

'Sorra word a lie in that, Miss Ellen,' replied Tim, as he placed the last young geranium in its pot. 'She's a good girl, and as purty a one as you'd see in a summer's day; but I'm thinkin' I'll step up an' see them all before I *spake* to her.'

'Why, Tim, have things gone so far as that?'

'Well, I may say I have her courted up to the axin, miss.'

'And the other, Tim?' I asked, intensely amused.

'Troth, I don't know, but I have her on hands too.'

'Now, is that fair to either?' I asked rather indignantly.

'Begorra, I don't know. A man has to look before him sharp.'

'And who is the other? Mary's cousin?'

'Yes, miss—long Tom Connor's daughter, from Shruve. She's up with Mary since Holly-eve. Hudie's lookin' after her.'

'She's no beauty, Tim.'

'No, miss; but she's settled. They do say she's a trifle coarse in the temper; but she has the finest two-year-old heifer ever I set my eyes on. A pure beauty, Miss Ellen.'

'And what good would the cow be to you, Tim, if you had a sour cross-grained wife at home?'

'Maybe she wouldn't be sour or cross when she'd have a good house over her head an' plenty. She's gettin' old, Miss Ellen, and she sees the young ones comin' on, an' her left. There'd be a quare change in her if she had her own way.'

'You seem to think m^ug^h of the cow than the girl, Tim!' I retorted.

'Troth, it's the p^unaval av the two. But miss, I'm sayin', what yⁿ who an' advise me?'

'Marry the girl's have to be best, Tim; never mind the cow. A you^u like ap^uered girl like Mary, who's been so g^uweet, her sickly father and

mother, so gentle and loving to those wild brothers, cannot fail to make a good wife. You will never be sorry, if you marry the girl you like best.'

'True for you, ma'am—true for you. She is a good girl, an' I'm nigh-hand sure I like her beyant any woman in the world; but Miss Ellen, I'd wish she had the cow!'

Next day I left home, nor did I return until the daffodils were glittering in the springing meadows around our home, and the rooks cawing over their fledglings in the woods behind our garden. Tim was married. I had heard that from mother early in the year; but upon which fair maid his choice had fallen, I was still uncertain. It was late at night when I returned from my travels, and mother had far too much to talk of to tell me the termination of Tim's courtship.

In the morning, I took my way into the garden, the farm-yard, the fields lying close by; but Tim was not to be seen; nor did I encounter him until late in the afternoon, when I discovered him busily trenching up some early cabbages in the back-garden. He seemed rather shy of me; but I put out my hand and greeted him kindly.

'You're welcome home, Mrs Grace, ma'am,' he said, striking his spade into the fresh-turned earth, and shaking the hand I gave him with more than ordinary warmth. 'We were thinking very long to have got you back.'

'Thank you, Tim. So I have to wish you joy.'

Tim looked sheepish, but speedily recovered himself. 'Yes, ma'am, if joy it be.'

'Oh, there can be no doubt on that score, Tim. I hope Mary is well?'

'Mary? Is it Mary Dogherty? Why, she's spoke of with Lanty Maguire that owns the ferry.'

'Why, I thought you were going to marry Mary, Tim?'

'Well, no, Miss Ellen, I did not. I b'lieve her an' Lanty was cried Sunday was eight days.'

'And what made you change your mind, Tim?'

'Well, I just took Susie; for you see, Miss Ellen, I judged a cow would make the differ betwixt any two women in the world.'

So after all, the cow carried the day!

CLERKS.

BY ONE OF THEM.

ANYBODY who can write may be a clerk: that is the general notion, which is far from correct. Among other accomplishments, an accurate and thorough knowledge of book-keeping is required, and so is a knowledge of the style employed in official and business letters. In numerous cases, parents in selecting avocations for their sons are induced, from perhaps laudable, but somewhat false notions of 'gentility,' to make them clerks, frequently with little regard to their aptitude for such an occupation. They seem to forget or to ignore the fact that there are other departments of the commercial world where there is room enough and to spare for more candidates, and many branches of skilled labour where ready and well remunerated occupation could be found. The consequence is that among those now in the service there are many who have mistaken their avocations, numbers who would probably have

succeeded well in some other sphere, not a few others more fit to wield a sledge-hammer or handle a wheel-barrow, than to write a letter, keep a ledger, or prepare a balance-sheet.

Of course, as is generally known, there are grades in this as in other professions. As might be expected, there are not only skilled and half-skilled labourers, but an admixture of drones. The variety of employment and responsibility of clerks is almost endless; there is no common level to which they are subject. Their position is peculiarly one of trust. In many cases the clerk has to control the expenditure of his employer's money, which necessitates the possession of certain habits and characteristics. It is not only important that he should possess the requisite competency for the performance of the duties intrusted to him, but his employers should know of what his peculiar individuality consists; for clerks are to a large extent intrusted with the important task of working out the general principles on which the business of their employers is transacted. The man who is naturally unsystematic can hardly be expected to work by system in his business; he who in personal and domestic matters is extravagant, will not be very likely to introduce habits of economy into his business transactions. Genteel appearance, good handwriting, the ability to add up dexterously the columns of a ledger, are not the only qualifications needful in a really efficient clerk.

The object of account-keeping should be the production of a picture which in every detail, as well as in one general view, should at all times shew what and how work has been done, and with what result it has been performed. Unfortunately it is sometimes the case that clerks, especially youthful ones, do not seem to possess an adequate idea of the great object in view, and which they are intended to assist in carrying out. In the matter of correspondence too the ability of clerks is put to the test, and their natural temperament often exhibited. The art of correct letter-writing is not to be gained by the perusal of 'a Complete Letter-writer' however complete, but can only be acquired by study and practice, combined with some natural aptitude. Business-like and civilly worded letters are an earnest of business-like transactions, and may be taken as an index to the ruling principles which guide the actions of the principals. In this way, clerks are intrusted by their employers with an important responsibility, in which there is need of the exercise of tact, judgment, and sound principles.

In no small measure does the treatment of employers mould the general disposition of clerks; and no more powerful incentive can be given to the latter than that of knowing that they are in full possession of their employer's confidence. But before extending this confidence, and appealing to the higher motives of his clerks, it is all-important that the employer shall have selected men fitted for the places they are to occupy. If an air of suspicion prevails, occasional deceit on the part of the suspected can scarcely be wondered at. It is no less requisite that clerks should put confidence in each other, but unfortunately the existence of petty jealousies often stands in the way. And this is one of the peculiar character-

istics of clerks. There often exists a feeling that one encroaches on the domains of another, and not without cause; for there are those who 'run cunning,' if such an expression is admissible, and those who obtain favour and promotion by mere arrogance and effrontery. Then there are the excessively plausible men, whose working capital is well nigh restricted to the glibness of their tongue. Moral and mental excellence are as a consequence sometimes overridden, though as a rule but temporarily, for sooner or later the higher and more stalwart qualities of the quiet-spoken but thorough-going man must prevail. It must not be forgotten that employers need to have a good knowledge of human nature, to be proficient in the art of judging character, and to possess considerable tact; for unfortunately it sometimes happens that the more confidence placed in a man the less is he worthy of it.

There have been discussions innumerable as to the hours of manual labour; and important changes, some the result of legislation, have taken place. The overtaking of mental power is, however, of graver import than the overtaking of physical strength. In a large number of instances, clerks are in an easy position in this respect, those especially in certain government departments, banks, and some commercial houses. There are too many cases, however, in which clerks are grievously overworked. The case of many branches of the railway service may be cited where clerks are almost incessantly employed twelve or fourteen hours a day. Long hours are prevalent too in connection with many commercial houses, in which monotonous and unceasing labour during unreasonable hours, is a great tax on the nervous energies, and can only result in permanently weakening the system of those engaged in it.

The number of hours occupied is not, however, always a criterion to the amount of work performed. Could such a standard have been taken as a measure of tasks accomplished, the labour question would not have been one so difficult to deal with as it has come to be. It is sometimes the case that long hours are associated with comparatively little work. When time is not fully occupied, there is a tendency to procrastination—work is put off and put off, and then comes a final scramble to get it done by the specified time. In many instances, were shorter hours adopted and the time fully occupied, the same amount of work might be done, and done better; it would not appear so irksome, punctuality and method would be more easy of acquisition, and thus employers and employed would be alike benefited.

In point of salaries, the railway companies, and some other large companies, adopt a uniform scale applicable to junior clerks; but beyond this rule, each individual case is dealt with according to its merits, the rate of remuneration varying in proportion to length of service, nature of work performed, and responsibility entailed. Newspaper advertisements occasionally convey an idea as to the rate of remuneration in some instances. An advertiser in *The Times* recently required the services of a clerk in London, age nineteen to twenty-three, salary commencing forty pounds. Another, 'Wanted a man as clerk; salary twenty shillings weekly; must write a good hand, and be well up in

arithmetic.' It would be interesting to know what is here meant by a *man*? Three-and-fourpence a day for a *man* as clerk in London, who possibly might have a wife and what some call 'encumbrances!' One would indeed be sorry to quote this as a representative case; but it gives some weight to the assertion that there are instances too numerous of hard-working, underpaid clerks. No wonder that there should be among this class of men, so many pale and careworn faces, and coats threadbare at the elbows with long service.

Since Dickens in his inimitable style first published his tale of Scrooge and his unfortunate clerk, many changes have taken place; but it is to be feared that this character created in fiction is still reflected in some realities. It is a law of nature that everything flourishes in proportion to the encouragement it receives; and in the same way the actions and motives of servants are in a considerable measure ruled by the disposition of employers. Isolated cases there always will be in which good treatment will be abused; and the result of such circumstances naturally induces some hesitancy to repose confidence in any; but as a principle of general application, results must depend upon the nature of the treatment adopted.

Clerk-labour would seem to be frequently employed at the lowest possible price for which it can be procured. But the same principle as that employed by the manufacturer in paying a good price for a machine that shall do its work expeditiously and well, is equally applicable to the purchasing of clerk-labour, in which much discrimination and tact are necessary. Sometimes those who are least competent and painstaking are the most dissatisfied; some there are who do not appear to understand degrees of merit, but think that all should be reduced to something like a dead level—that mere length of service, for instance, should command the maximum of reward. To length of service some reward is due, but the tools should be put into the hands of those who can use them, and who should of course be rewarded accordingly. Mr T. Brassey, M.P., in a speech on the labour question said: 'It is most economical to pay labour well. It is better to employ fewer men at high wages than more men at low wages. Every individual is better off, and the total expenditure on labour is reduced. For the non-employed, fresh fields must be found, and these will be opened by the ingenuity and enterprise of mankind.'

The employment of females in certain departments of clerk-labour would seem to be a thing much to be desired and encouraged; and there is ample scope for such employment where the duties are light, straightforward, and not too onerous in character. That the candidates are numerous may be judged from the fact that some time ago, in response to an advertisement for eleven junior counter-women at metropolitan post-offices, from one thousand to one thousand five hundred young ladies presented themselves as applicants at the offices of the Civil Service Commissioners on one day! In cases where certain active business qualifications are essential, it is not to be desired, nor is it expected that females will in any degree displace the other sex. The opposition manifested by certain of the male sex to the opening thus afforded for the extension of female labour may fairly be characterised as somewhat unmanly.

But as we had occasion to say in an article on 'Female Occupations,' this extension of female labour will by natural laws not proceed beyond natural limits. The field for female work is circumscribed, and an extension in such a direction should be hailed with satisfaction. If the introduction of female clerk-labour displaces some of the overplus of boy clerks, and induces some to adopt avocations more suited to their natural fitness, much good will have been effected; for is not the accomplishment of account-keeping and a training in good business habits calculated to make better wives and mothers? An intimate acquaintance with simple account-keeping would be a valuable addition to the education of many ladies of the present day, and might save many a man's income which, but for his wife's accomplishment, would be unwittingly muddled away.

As a social animal, clerks possess some peculiar characteristics. The banker's clerk cultivates not the acquaintance of the lawyer's clerk; the draper's clerk prefers not to associate with the grocer's clerk. In the same establishment even, the spirit of caste has often a prominent place: those who by chance sit at a mahogany table would seem to say by their demeanour that they are far removed from those who occupy a deal desk. 'At Birmingham,' says Samuel Smiles in his *Thrift*, 'there was a club of workmen with tails to their coats, and another without tails: the one looked down upon the other.' What a great thing it would be if, in society generally, people would always have the courage to appear what they are, rather than try to seem what they are not! Some clerks if asked to describe their avocation would disavow anything so common as a clerkship; they would be 'an accountant'—anything but a clerk. What will not some folk do for the sake of keeping up appearances? and amongst clerks this disposition prevails to a considerable extent; as if appearance to the world, and not the ruling principles of a man's life, constituted the sole test of respectability. Douglas Jerrold said: 'Respectability is all very well for folks who can have it for ready-money; but to be obliged to run into debt for it, it's enough to break the heart of an angel.' Let those who are anxious for sound and wholesome advice upon this important subject read Mr Smiles' book above quoted.

The social life of unmarried clerks is capable of improvement, especially in large towns, into which there is continually flowing a stream of young men, who frequently have to be content with the first apparently comfortable lodging that presents itself, and to which nothing may be so foreign as the most ordinary home comforts, in addition to the accompanying risk of new associations formed of a kind both unexpected and undesirable, often likewise accompanied by impositions various and numerous. It has been suggested that clerks' inns or clubs should be established; and the idea is well worthy the consideration of all those who in any way are interested in the matter. The advantages to be derived from undertakings of this kind would be incalculable. Employers of clerk-labour would be indirectly benefited, and they would do well to assist in the promotion of any movement in the direction indicated. As regards clerks themselves, their comforts might be considerably increased and their

expenses lessened. Such establishments might of course be made something more than mere lodging-houses. Under proper management, they might become a general resort both for amusement and intellectual pastime. The constant social intercourse of clerks with each other would tend to engender good feeling, and by this association an entirely new state of things would be brought into existence. The exercise of some amount of discipline would alone result in untold good, and the fact of membership would constitute a permanent recommendation as to respectability. As regards expense, economy would be created by co-operation; the quality of every article of food might be insured. In fact, by this means might be secured a maximum of happiness and comfort for a minimum of expense.

A larger amount of judicious physical exercise than is now practised would be of great benefit to clerks. In the case of thousands in the large towns, this is seldom resorted to beyond the mere act of walking to and from business. In large establishments, organisations for such recreation might be more encouraged, and thus conduce to the great desideratum, of a healthy mind in a healthy body.

There is some doubt as to the future position and prospects of clerks generally, but as we have ventured to hint, little improvement can be anticipated until supply and demand become more equal. In many departments of skilled labour there is ample scope for educated men; in fact there is great need for them, and many a man now in clerk-service would have met with far greater success had he become an artisan. Indeed one sometimes hears an expression of regret to the effect that the task of wielding the pen, though it be 'mightier than the sword,' had not given place to the tools of a skilled workman. The fact of receiving a salary and working short hours seems to possess a considerable attraction to many, but it would be well if this unsubstantial state of feeling were removed. In many trades, such as book-binding, there is often great difficulty in obtaining a sufficient number of hands, especially 'hands with heads,' the services of a tasteful 'finisher' being highly paid.

Without in any degree depreciating the importance of and necessity for efficient clerk-labour, it would seem, taking a broad view of the question, that the chances of success in life of educated and persevering mechanics are fully equal to the prospects of the majority of clerks. In many cases the comparison is in favour of the artisan. The man with a trade possesses a sort of independence, and opportunities are frequent for his becoming his own master.

The Council of the Society of Arts has taken an important step in the matter of education. It has been arranged for examinations to take place, particularly for young men; certificates are to be given to those who are successful, and this will act as a passport to commercial employment. The subjects of examination are as follows: Arithmetic, English (composition, correspondence, and précis writing), book-keeping, commercial history, and geography, short-hand, political economy, French, German, Italian, Spanish. To entitle a candidate to this 'certificate in commercial knowledge,' he must pass in three subjects, two of which must be arithmetic and English. Every

encouragement should be given to such a movement, calculated as it is to raise the general standard of efficiency of clerks in the future; and to those now in the service such a scheme is calculated to convey some benefit.

A LADY'S JOURNEY IN MOLDAVIA.

I AM going to describe a journey I made across Moldavia in 1863. Determined to leave the dust and malaria behind us for a time, we set out from Galatz one beautiful morning in the summer of the year 1863, in search of the cooler air which blows on the western side of the Carpathians. A village of the Siebenbürgen, near the old town of Kronstadt, was our destination. Early in the morning we prepared to start—two ladies, two nurses, and four children; all resigned to the absolute control and guidance of Herr F——, our dragoman and courier; a little round bustling man, speaking every European language with the ease of a not particularly refined native; literally splendid in theory and fertility of resource while any plan was under discussion, though hardly equal to himself in a practical emergency.

It was already dark when we arrived at the town of Tekoutch. After a good deal of waiting and difficulty, the Herr succeeded in procuring for us the shelter of two flea-haunted chambers at the top of a steep ladder. Whether this place was the principal hotel of Tekoutch or only one of the Herr's failures, I cannot say. All four children were sleepy, hungry, hot, and unhappy. Oh! for milk to make a refreshing drink for the poor sick baby, who was wailing so piteously! Our repeated calls brought upon the scene a hag—a hag who would have been invaluable in melodrama, but whose presence in the actual state of affairs superadded active terror to the passive discomfort of the children. Her upper-country Moldavian was hardly intelligible, and she quite refused to understand our modes of expressing ourselves. But constant reiteration of the substantive 'Milk,' in every language and dialect known to us, was at last so far successful that we procured a small quantity of a curious gray fluid mixed with fine sand, which the poor little ones were too sleepy to judge critically; and we had soon the satisfaction of seeing them asleep on the divans with their nurses beside them. Before daybreak we were all awake, and renewing the struggle with the hag for the necessary provision of milk, to which she was good enough to add a few cups of black coffee. We removed such traces of yesterday's dust as we could, by dipping the corners of our towels in glasses of water. The Roumanian peasant's idea of washing is so different from ours that it is almost impossible to make them understand one's requirements in that respect. A jar of water, a friend to hold the jar, and standing-room in the open air, are his requisites. He stands bent well forward, to avoid the splashes, while the friend pours a little water—a very little—into his hollowed hands. These he rubs together, then holds them out for a second supply, with which he moistens the region immediately round his nose.

The whole process requires a certain amount of skill and dexterity, to which the results are hardly commensurate.

Before five A.M. we were on the road again. Our way lay through a very pleasant region, and we suffered much less from heat and dust than the day before. The country was undulating and less uniform. The roads were real roads, not mere tracks through the fields, or across the steppe. The wheat and barley were luxuriant all round; and great fields of mustard in full bloom made patches of a yellow, perfectly dazzling in its brightness. As we approached the higher country we came on large tracts of grazing-land soft and rich: trees were scattered about—oak, hornbeam, lime, and wild cherry, with an occasional birch or pine. Thorn and rose bushes, tall as trees, shook showers of blossom around. There were groups of feathery tamarisk, clusters of Guelder-rose, and bowers of white clematis thrown from shrub to shrub. The roadside was a garden of wild-flowers; tall spikes bearing alternate rings of deep purple leaves and the brightest of yellow blossoms, blue chichory, rose-coloured pea-blossom, sweet-williams, and aromatic herbs that filled the air with their perfume. A Roumanian cottage is generally a pleasant resting-place in the heat of summer; the roof of reed-thatch, or oak-shingle, projects so far as to shade the whole cottage, and within are whitewashed walls, and cushioned divans covered with rugs of thick home-made cloth, woven in brightly coloured stripes.

In the little inn at Domnul where we next arrived we laid down the children to take siesta; and by four next morning we were astir again and eager to set out, as we knew that a few hours' driving would bring us to the Oitos Pass, of the beauties of which we had heard so much. By half-past five we were off. The country got more lovely at every step. Low wooded hills rose in front; the glens, between, highly cultivated, though uneven and rugged in places. The road was terraced along the side of an abrupt slope: the driver of the baggage wagon managed to get a wheel on the bank, and over went the wagon, boxes and bundles rolling pell-mell down the hill. An hour's work, not without much vocal accompaniment, put all to rights, and our caravan was again in motion. Many brooks made their way down from the hills, and we had to cross numerous wooden bridges, for the most part in a very sad state of repair. Here a plank was missing, and a hole yawning under the horses' feet, shewed the foaming water beneath; there another rose and tilted up as the horses trod on the end. But the steady little animals never flinched; they picked their footing as mules would have done, and so we passed in safety. At noon our rest only lasted half an hour, and soon after starting we came to the Roumanian guard-house at the entrance of the pass. We were joined at this point by two Austrian soldiers, who accompanied us on horseback through the pass, bringing up the rear of our procession.

On all sides of us the steep, richly wooded hills rose abruptly; higher mountains shewing their snowy caps at intervals as the gorge opened up the distant view. Here, there, and everywhere roared and brawled the little river; now narrow as a winding thread, deep, below the road, which crossed and recrossed it by means of bridges, the

safe passing of which seemed each time a fresh miracle; now widening in gleaming shallows, as from time to time the glen spread itself out to hold a little village. Each separate patch of gray rock contained its homestead; white cottages, with dark, quaintly carved, and pinnacled shingle-roofs, overshadowed by orchard trees or festooned with trailing vines. The population seemed to live in the water; men were fishing in the pools, women beating the linen on the flat rocks, or spreading the webs to bleach in the sunshine; while the children waded about in their one short garment, or bathed, diving plunging and chasing each other like veritable troops of 'water-babies.' What a handsome race they were, those Roumans of the Carpathians! Those we met on the road passed us with a courteous greeting, and went on their way; the women in their long white garments, drawn in at the waist by a broad brass-studded leather belt; the many coloured fringe, which fell straight, almost to their ankles, opening here and there as they walked to shew glimpses of the white below. Their feet were bare or covered by moccasins of undressed leather. Over their coils of plaited hair lay a square of embroidered linen, from one corner of which a coin hung over the forehead, and more coins formed earrings and rows of necklaces. The men wore a great loose white blouse, a studded belt, broader and heavier than those of the women, in which were stuck knives, daggers, and heavy pistols. On their feet were either moccasins or boots high above the knee. Their long uncut hair hung over their shoulders; and, twisted round their broad hats were ribbons of the national colours—red, blue, and yellow.

The ascent at first was gradual, but our horses being tired, we all walked for several hours. The soft rich beauty of the glen increased at each moment; hill rose above hill, covered with the mellow green of the young fir shoots, each tree bearing the golden red crown of last year's cones. The hanging birches with their silver stems swept over slopes smooth as a lawn, save where here and there the bold gray rock cropped out. Little glens ran up the mountain sides, scented with wild thyme, which overpowered even the fragrance of birch and fir. An hour before sunset we reached a large village the name of which I have forgotten. Here were more guard-houses, and difficulties about examining our baggage. As we were anxious to avoid this scrutiny, we administered a gratuity to the guards, who speedily became our friends; but as we were preparing to resume our journey an unfortunate difficulty arose.

The Herr announced to us after half an hour's search, that no horses were to be procured. 'Then we had better remain here for the night,' we decided at once. But no. The Herr had undertaken us, and he alone must have an opinion. We felt that he knew the country, and that we did not, and gave way, though unwillingly, on his assurance that less than twenty minutes would bring us to the Austrian frontier, where we would be sure to find fresh horses. So we reluctantly resented ourselves. The horses had been at work since early morning, and were utterly exhausted, crawling at a foot's pace. The shades were gathering deeper and deeper around us; the ground rose much more rapidly than before; the road in some places was so bad as to be almost impassable; worst opposite a tablet let into the

rock, which informed the grateful traveller, in letters of gold and in choice Latin, how Prince Alexander Ghyka had made and finished it in 1855. The Herr's twenty minutes had lengthened to an hour or more when we reached a narrow treeless gorge, the heights crowned on either side by half-ruined fortress towers, while grim loop-holed modern walls ran down to meet in an immense gateway, whose shut doors barred our path. To the left, a small plateau of green turf bordered the crag overhanging the stream, which now held its rapid course many feet below us.

Our arrival was an event. The guardian of the pass was fat, fussy, and important, and quite deaf to any representations of our anxiety to proceed. Had we anything to declare? No; certainly not. No tea? No. Nor tobacco? No. But then it struck him that there must be some tobacco for present use among our drivers; so a strict personal search was made; the tobacco-pouches were emptied, and their contents thrown over the crag. We were injudicious enough to remonstrate, as we would willingly have paid something to allow the poor men to keep their tobacco; and this seemed to determine our *douanier* to display his authority to the full, for soon the sword was strewn with our possessions, which included bedding, provisions, and books, as well as the clothing of the whole party. The men must have had a dull time of it in this lonely mountain fort, to judge from their excitement at the display of our goods. At last we seized a packet of tapioca and implored the great man to pass it and the nurses and children, that they might find rest and refreshment beyond the gates. To this, after a very critical scrutiny, he consented; and we despatched them to look for a *krishma* beyond the boundary.

When we had satisfied the *douanier* and seen such order as was possible restored to our luggage, we followed, and found them installed in a miserably dirty little place, where the children of the family, who were crowding round, looked so evidently ill, that, fearing something infectious, we were constrained to hurry the preparation of the tapioca, and go out again to the open air. At last the Herr appeared, and had to confess his failure. We ought to have passed the night at the village we had left two hours before; to pass it here was impossible.

'We must feed the horses and push on,' said the Herr; 'it is not an hour's drive.'

Alas! we were beginning to understand but too well what the Herr's 'hours' were like. But the night was mild and pleasant, though already dark; and having arranged beds for the children among the cushions, we continued our journey with a briskness on the part of both drivers and horses which was wonderful after the hard day's work they had gone through. There was just light enough from the stars to shew us the dangerous nature of the road, which rose in rapid zigzags. There was no parapet, and the little river ran below at a depth which increased at every turn. The heavy travelling-carriage seemed to drag back the horses, and the drivers of the wagons had to stop and push it up. At last we reached the top; but it was two o'clock before we reached Bereck. All the inhabitants were asleep; but the people of the *krishma*, after we had roused them, received us very hospitably, and busied themselves in attending to our comforts. It was late next morning

when we resumed our journey, and we were now able to perceive that the scene had a beauty of its own—that of vast extent. Nowhere have I seen a wider horizon, and yet hills closed it in all round, but at a great distance. The plain over which we were passing formed a vast amphitheatre, and the eye took in at one sweep at least a dozen villages, all widely apart from each other. The roads were as excellent as, under Austrian management, they always are. Good horses were to be found at all the posting-houses; and by the middle of the following day we had approached the mountains which bounded the other side of the plain, and found ourselves at our journey's end.

THE CHANGES OF COLOUR IN THE CHAMELEON.

FROM very ancient times the curious changes of colour which take place in the chameleon, and its supposed power of living on air, have been the wonder of the uninformed, and have furnished philosophers and poets with abundant material for metaphor. The belief that the animal can live on air has been exploded long ago, and was no doubt due to its power of long fasting and to its peculiar manner of breathing. It is only quite lately, however, that any satisfactory explanation has been given of the apparently capricious changes which take place in the colour of the chameleon; the latest researches on the subject being those of M. Paul Bert, the French naturalist, which have been described in a recent paper by M. E. Oustalet. As most of our readers are no doubt familiar with the appearance and figure of this curious reptile, and as descriptions of it may be found in any encyclopædia or elementary work on natural history, we do not consider it necessary to repeat them here.

Many and various theories have been proposed to explain the changes of colour which chameleons undergo; changes the importance of which have been greatly exaggerated. It is generally believed that these animals have the power of assuming in a few seconds the colour of any neighbouring object, and that they intentionally make use of this trick to escape more easily from the sight of their enemies. But this opinion is erroneous; and experiments conducted with the greatest care have proved that chameleons are incapable of modifying their external appearance in anything like so rapid and complete a manner.

The first probably to give any rational account of the causes of the puzzling changes of colour in these reptiles was the celebrated French naturalist, Milne-Edwards, about forty years ago. After a patient and minute examination, he discovered that the colouring matters of the skin, the pigments, are not confined as in mammals and birds, to the deep layer of the epidermis, but are partly distributed on the surface of the dermis or true skin, partly located more deeply, and stored in a series of little cells or bags of very peculiar formation. These colour-cells are capable of being shifted in position. When they are brought close to the surface of the outer skin, they cause a

definite hue or hues to become apparent; but by depressing the cells and causing them to disappear, the hues can be rendered paler, or may be altogether dispersed. It is noteworthy that the cuttle-fishes change colour in a similar manner.

Underneath the colour-bags (or *chromoblasts* as they are called) of Milne-Edwards, Pouchet, a recent inquirer, has discovered a remarkable layer, which he calls *cærulescent*, and which possesses the singular property of appearing yellow on a clear, and blue on an opaque background.

M. Paul Bert, within the last two years, has by his researches thrown still further light upon these curious changes, and upon the mechanism by which they appear to be accomplished. He endorses most of the results of Milne-Edwards and subsequent inquirers, but has carried his observations much further. It would be out of place here to give a detailed account of the methods by which M. Bert has arrived at his conclusions. Suffice it to say, that by a series of careful experiments, he has discovered that these changes of colour seem to be entirely under the control of the nervous system, and that the chameleon can no more help them taking place than a toad can help twitching its leg when pinched. By acting in various ways upon the spinal marrow and the brain, the operator can send the colour to or withdraw it from any part of the body he pleases. Indeed a previous observer was able to cause a change of colour in a piece of the skin of the animal by acting upon it with electricity; and M. Bert has proved that even in the absence of the brain the usual changes can be produced by exciting the animal in any way; thus showing that they are due to that class of nervous action which physiologists name *reflex*, and of which sneezing is a good example. M. Bert has also made some interesting experiments on the animal while under the influence of anæsthetics and during sleep. It was formerly known that in the latter case, and also after death, the chameleon assumed a yellowish colour, which under the influence of light became more or less dark. M. Bert has found that exactly the same effects are produced during anæsthesia as during natural sleep, and that light influences not only dead and sleeping chameleons, but that it modifies in a very curious fashion the coloration of the animal when wide awake. The same result is produced when the light is transmitted through glass of a deep blue colour, but ceases completely when red or yellow glass is used. To render these results more decisive, M. Bert contrived to throw the light of a powerful lamp upon a sleeping chameleon, taking care to keep in the shade a part of the animal's back, by means of a perforated screen. The result was curious: the head, the neck, the legs, the abdomen, and the tail became of a very dark green; while the back appeared as if covered with a light brown saddle of irregular outline, with two brown spots corresponding to the holes in the screen. Again, by placing another animal, quite awake, in full sunlight, but with the fore-part of its body behind a piece of red glass, and the hind-part underneath blue glass, M. Bert divided the body into two quite distinct parts—one of a clear green with a few reddish spots, and the other of a dark green with very prominent spots.

From his researches as a whole, M. Bert concludes: 1. The colours and the various tints

which chameleons assume are due to changes in the position of the coloured corpuscles, which sometimes, by sinking underneath the skin, form an opaque background underneath the *cærulescent* layer of Pouchet; sometimes, by spreading themselves out in superficial ramifications, leave to the skin its yellow colour, or make it appear green and black. 2. The movements of these colour-bags or chromoblasts are regulated by two groups of nerves, one of which causes them to rise from below to the surface, while the other produces the opposite effect.

As to the effects produced by coloured glass, they no doubt result from the fact that the coloured corpuscles, like certain chemical substances, are not equally influenced by all the rays of the spectrum, the rays belonging to the violet part having alone the power of causing the colour-bags to move and drawing them close to the surface of the skin. This exciting action of light on a surface capable of contraction, an action which hitherto has only been recognised in the case of heat and electricity, is one of the most unexpected and curious facts which in recent times have transpired in the domain of physiology. Hence M. Paul Bert's researches are likely to prove of far more value than merely to explain the changes of colour which take place in the chameleon. He hopes especially in carrying out his researches to discover the reason of the favourable influence on health which is exerted by the direct action of light on the skin of children and of persons of a lymphatic temperament; and this may lead to some very important practical results in the treatment of disease. In the meantime he has done much to clear up a very puzzling and very interesting fact.

MY SWEETHEART.

Do you know my sweetheart, sir?
She has fled and gone away.
I've lost my love; pray tell to me
Have you seen her pass to-day?

Dewy bluebells are her eyes;
Golden corn her waving hair;
Her cheeks are of the sweet blush-roses:
Have you seen this maiden fair?

White lilies are her neck, sir;
And her breath the eglantine;
Her rosy lips the red carnations:
Such is she, this maiden mine.

The light wind is her laughter;
The murmuring brooks her song;
Her tears, so full of tender pity,
In the clouds are borne along.

The sunbeams are her smiles;
The leaves her footsteps light;
To kiss each coy flower into life
Is my true love's delight.

I will tell ye who she is,
And how all things become her.
Bend down, that I may whisper
My sweetheart's name is—'Summer.'

YOUTHFUL PRODIGES.

A CURIOUS question has more than once been asked: have the most remarkable works, in the various kinds of literary labour, been produced in the flush of youth or the calmness of age? Are men better fitted for vigorous exercise of the mind in the first half or the second half of their existence? The spring and elasticity of temperament, the warmth of feeling, the hopeful aspirations, the activity of vital energy, the longing to throw the thoughts into some kind of words or of music—all tempt one, at a first glance, to say that early authorship is more probable than later.

Certainly the examples of young authorship are neither few nor unimportant. Of course we may take Tristram Shandy's authority with as many grains of allowance as we please; but the marvels told in his colloquy are unique. Yorick declared that Vincent Quirinus, before he was eight years old, pasted up in the public schools of Rome more than four thousand five hundred theses on abstruse questions, and defended them against all opponents. Mr Shandy capped this by citing one erudite man who learned all the sciences and liberal arts without being taught any of them.

Isaac D'Israeli, in his *Curiosities of Literature*, notices many curious examples; and the subject was taken up by a pleasant writer in the *Globe* newspaper, a few months ago. Pope wrote some of his *Pastorals* at sixteen; and a large number of his works, including the translation of Homer, were thrown off before he reached thirty. Edgar Poe wrote his *Helen*, remarkable for its beauty of style, when scarcely more than eleven years old. Cowley at fifteen published his *Poetic Blossoms*; while his *Pyramus and Thisbe*, though not published till his sixteenth year, is said to have been written when he was only ten. Lord Bacon planned his great work, the *Novum Organum Scientiarum*, when only sixteen, although the writing was the work of maturer years. The late Bishop Thirlwall wrote his *Primitiæ* when a boy of only eleven years of age: he was one of the few who wrote

both early and late, a wonderful example of long-continued mental activity. Dr Watts almost *thought* in verse when a boy. Crabbe wrote both early and late, but not much in middle life; he published his first poem at twenty, and his *Village* before thirty; then a silence of twenty years was followed by a renewal of literary labour. Charlotte Brontë wrote in very early life, 'because she could not help it.' Chatterton, the scapegrace who applied so much of his marvellous powers to dishonest or lying purposes, wrote minor pieces of poetry at fifteen, and soon afterwards a pretended pedigree of a Bristol family. At sixteen he published the alleged plays and poems of Rowley, described by him as a priest or monk of the fifteenth century; at about seventeen he brought forward some pretended old parchments, made to appear soiled and time-worn, containing a fictitious description of an old bridge at Bristol; and then wrote biographies of Bristol artists who never lived. Coming to London, he wrote many satirical and political papers for the press; and ended his extraordinary life before he had completed his eighteenth year.

As a child (never so old as what we should call a 'lad'), Christian Heineker was one of the most singular of whom we find record. He was born at Lubeck about a century and a half ago. When only ten months old he could (if we are to believe the accounts of him) repeat every word said to him; at twelve months he knew much of Plutarch by heart; at two years he knew the greater part of the Bible; at three could answer most questions in universal history and geography (as then taught), and began to learn French and Latin; before four he began theology and church history, and expressed argumentative opinions thereon. This precocious little podant died before he had completed his fifth year.

The late John Stuart Mill 'had no recollection of the time when he began to learn Greek;' but was told it was when he was only three years old. Adanson began at thirteen to write notes on the Natural Histories of Aristotle and Pliny. The calculating boys—Vito Mangiamela, Jedediah

Buxton, Zerah Colburn, and George Parker Bidder—illustrate a remarkable phase of early mental activity.

On the other hand, many authors have produced their best works late in life, and have begun new studies at an age when the majority long for mental leisure. Izaak Walton wrote some of his most interesting biographies in his eighty-fifth year, and edited a poetical work at ninety. Hobbes published his version of the *Odyssey* at eighty-seven, and of the *Iliad* at eighty-eight. Sir Francis Palgrave, under an assumed name, published at eighty years old a French translation of a Latin poem.

Isaac D'Israeli notes that Socrates learned to play a musical instrument in his old age; that Cato learned Greek at eighty; that Plutarch entered upon the study of Latin almost as late in life; that Theophrastus began his *Characteristics* at ninety; that Sir Henry Spelman, a gentleman-farmer until fifty, at that age began to study law, and became an eminent jurist and antiquary; that Colbert, the distinguished statesman, resumed the study of Latin and of law at sixty; that the Marquis de Saint Aulaire began to write poetry at seventy, 'verses full of fire, delicacy, and sweetness;' that Chaucer did not finish his *Canterbury Tales* till he had reached sixty-one; that Dryden felt his powers sufficiently in their strength at sixty-eight to plan a complete translation of Homer's *Iliad* into English verse, although circumstances prevented him from giving effect to his intentions; and (but this we must leave to the investigators who advise us to disbelieve most of the stories we hear or read concerning persons exceeding a century old) that Ludovico Monaldeschi wrote his *Memoirs* of his own times at the extraordinary age of a hundred and fifteen!

Dipping into the literary annals of different ages and different countries, there are not wanting abundant additional examples of men continuing their literary work to an advanced period of life, or else beginning *de novo* at an age when most men would prefer to lay down the pen and let the mind and the brain rest. Montfaucon, the learned authority on artistic antiquities, continued his custom of writing for eight hours a day nearly till his death at the age of eighty-seven. His labours, too, had been of a very formidable kind; for he was seventy-nine when he put the finishing touch to his *Monumens de la Monarchie Française*, in five folio volumes; and eighty-five when he published the *Bibliotheca Bibliothecarum*, in two tomes of similar magnitude. John Britton and John Nichols, artistic and antiquarian writers, both continued to drive the quill till past eighty. Sir Isaac Newton worked on till death, in his eighty-fourth year, but did not make scientific discoveries in the later period of his career. Euler worked on at his abstruse mathematical writings till past eighty. William Cowper, although he wrote a few hymns and letters in early life, did not till after fifty begin those works on which his fame chiefly rests

—beginning with *Truth*, and going on to *Table Talk*, *Expostulation*, *Error*, *Hope*, *Charity*, *Conversation*, *Retirement*, *The Task*, *John Gilpin*, and the translation of Homer. Gray wrote late and little, devoting seven years to polishing and perfecting his famous *Elegy*. Alfieri, who was taught more French than Italian when a boy, studied his native language sedulously late in life, in order to be able to read the great Italian poets; and wrote his own principal works afterwards. Goethe gave advice, which is certainly not followed by the majority of novelists—namely, not to write novels till past forty; because until then we have scarcely an adequate knowledge of the world and of the human heart. Necker said in his old age: 'The era of threescore and ten is an agreeable age for writing; your mind has not lost its vigour, and envy leaves you in peace.' This corresponds in substance to a reply given by the hale and hearty old premier, Lord Palmerston, to a question 'When is a man in his prime?' 'At seventy.'

Musical genius, or at anyrate musical aptitude, has often developed itself in very early life. Sometimes this aptitude is hereditary in a notable degree. Veit Bach, a miller and baker at Hamburg about the middle of the sixteenth century, turned his attention to music, becoming a guitar-player and teacher; his son cultivated music generally, and lived by it as a profession; the grandson devoted himself to church music; the representative of the next generation was music director to the court and town of Eisenach. The fifth generation was marked by the renowned John Sebastian Bach, grandson's grandson of old Veit; he had to earn his living as a choir-boy, and lived to become one of the greatest of composers and organists. There were no fewer than fifty-eight of these Bachs between 1520 and 1750, every one of them musical. As an example of musical precocity, however, Mozart was far more remarkable than any of the Bachs. At three years old he experienced great pleasure in finding out chords on the pianoforte; at four he learned short pieces of music; and at six composed a pianoforte concerto, methodically arranged. He was then taken as a musical prodigy by his father (who was also a musician) to Munich, Venice, Paris, Milan, Bologna, Naples, Hamburg, London, and other cities, where the performances of the boy excited universal astonishment. In London, when only eight years old, Mozart composed six pianoforte sonatas, which he dedicated to Queen Charlotte. His first opera, *Mithridate*, was composed when he was fourteen; and about the same time he was appointed director of the Archbishop of Salzburg's concerts. He was quite an old musician by the time he became a young man—twenty-four years old when he composed *Idomeneo*; at thirty, *Le Nozze di Figaro*; at thirty-one, *Don Giovanni*; at thirty-five, *Il Flauto Magico*; and at thirty-six (shortly before his death) the *Requiem*—the magnificent series of masses, motetts, symphonies, concertos, &c., coming in between at intervals. Mendelssohn was another great composer whose life-work was wholly finished by the age of thirty-eight. He gave a public concert at Berlin at the age of nine; and while yet a youth composed numerous instrumental pieces—the remarkable *Isles of Fingal*, and the still more striking music to the *Midsummer Night's Dream*. How he poured forth, as a young man, his oratorios, cantatas, *Lieder ohne*

Worte, overtures, symphonies, concertos, sonatas, quartettes, *Athalie*, *Antigone*, *Edipus*, *Walpurgisnacht*, &c., musical biography has told at full length.

One musical phenomenon is noticeable, not for his skill as a musical performer or composer, but for the way in which music seems to have formed part of his very being. This was Carl Anton Eckert, son of a sergeant of the Guards in the Prussian service, and born in 1820. While in his cradle, he was affected to tears by any music in the minor key. At the age of one year and a half, hearing his father play *Schöne Minka* with one hand on an old pianoforte, he immediately played it with both hands, employing his knuckles to aid his tiny fingers. He retained in his ear every tune he heard; and in his fourth year could name the pitch of any note on hearing it played.

Somewhat similar to Eckert in musical sensibility was Charles Wesley, nephew of the famous founder of the Wesleyan Methodists. As a child, he could always be pacified by his mother playing the harpsichord. Tied on a chair, he could be left alone for hours amusing himself by making music on the instrument. Before he was three years old he could play tunes in correct time, treble and bass; and soon afterwards was able to put a tolerably good bass to any tune he heard, without study or premeditation. Much flattered as a prodigy, he nevertheless failed to rise at any period of his life above a mediocre standard as a player or composer. Samuel Wesley, Charles's brother, was like him imbued with music from the cradle. Before he was three years old he could play a tune on the harpsichord; he made a correct bass before knowing musical notation; and learned to read from the words of songs in the music-books. He composed music before he could write, and was only eight years old when he composed an oratorio on the subject of Ruth. Some of our famous composers, on the other hand, have not commenced their best works until middle life, and have produced their very best at a somewhat advanced age.

On careful collation of known facts, we shall probably arrive at the conclusion that a medium position is better than either extreme; that a judicious diffusion of mental labour throughout a series of years is the best course for mind and body. Precocity is considered by some physicians as partaking of the nature of disease; very few 'infant prodigies' live to become distinguished men and women. Dr Richardson, in his *Diseases of Modern Life*, maintains the thesis that an average activity of mind throughout the whole of life is better than forcing it abnormally at the beginning. Another writer has observed that, by crowding the main business of life into the first forty years, with the design of taking things cosily by an early retirement and a long rest, the vital springs are dried up, the brain becomes prematurely withered by the excessive demands made upon it. The brain requires exercise like any other organ, but also, like any other organ, should not be worked to excess in early life. Many of our best writers have wrought well alike in early, middle, and advanced age, simply because they utilised their mental and vital resources judiciously. Sir Walter Scott is cited as a good instance in point. He wrote his poems in early life; produced in his maturity the wonderful

series of novels and romances that will never die; and would probably have written his later works in masterly style if he had allowed himself time for the purpose. But adverse fortune decided otherwise; he exhausted himself by working intensely and earning enormously to pay off a debt: it virtually killed him.

FROM DAWN TO SUNSET.

PART II.

CHAPTER THE SECOND.

THE next day came the lads Kingston and Charlie Fleming. Kingston was still 'reading,' and sowing his wild oats broadcast and winning honours, all in one. Charlie just started on his career, Sir Vincent best knew how.

It happened that King Fleming found his cousin Deborah alone; she was reading in her own room, where he sought her. She turned on him with a sudden rush of colour and defiant eyes: 'You are not invited here!'

Kingston approached as if he trod on eggs, cap in hand. 'Nay, sweet lady, yet I venture. Deb, you blush! You are reading evil; or is it o' love? O love, love, thou pleasure pain and torment! That same little unruly god with his bow and arrows, hath "shot and hit me sore!"' He sat down opposite Deborah, and gazed at her in his quaint droll way, that had in it a touch of pathos too.

Deborah's lips curled: 'I understand you not.'

Kingston shook his head in some ironical mockery. 'Nay, sweet Deb, that thou dost not, for never was a tougher heart than thine! *Thou* wilt never love, Deb; never feel thy heart pitapat, and thy cheek flame, for any mortal man; yet thou hast great promise of beauty and grace; thou wilt doubtless make a great match—all the women o' the Flemings do; an' if thou dost, I shall be proud o' thee.'

'I do not ask your applause,' retorted Deborah, with sudden fire and disdain. 'But I will not argue with you,' she added, with disdain alone. 'You have a weak head now, except for Greek and Latin. Just like a lad, your head runs ever upon marriage, and your tongue can prate o' nothing else.'

Kingston raised his eyebrows as a shade of colour crossed his brow. 'Just like a lad? Ay, and in nature, just like a lass also. But Mistress Fleming must not be judged by nature's law; her soul soars above all sublunary matters. What dost thou dream of, Deborah? Come! Hast not one idle dream, one erring thought, one tender folly to confess? The daisy!—the daisy, Deb—two years ago!'

Deborah sprang defiantly to her feet, her eyes like two orbs of fire. 'Master Fleming,' she said, 'either you or I must quit this room! Kingston, I bear from you taunts and insults, but I will bear no more. Under cover o' this, you *hate* me!—and I hate you!' And with that she was gone.

Kingston sat on his stool and stared before him:

his odd brown face—a face beautiful with the changeful lights of feeling and intellect—assumed a hundred rapid expressions of wonder, regret, pity, remorse, and amaze. His beautiful child-cousin was 'one too much for him.' He never could comprehend her. He did not even admire her tanned dishevelled beauty, and he certainly did not love her; but he stayed himself to pity her, thinking that with such ungovernable passions she must go mad at last. With that, his boyish face grew sad, and he looked very forlorn, sitting in Deborah's sanctum with his lank yellow hair straying across his brow. As for Deborah, after a storm of tears hidden in the pantry, she dried her eyes on her apron like a poor passionate child, and went to seek Charlie, with no malice in her heart—only shame. Charlie was cleaning his gun in the saddle-room, watched at a respectful distance by Mistress Dinnage, who was squatting on the ground and looking low in spirits. Charlie was too busy to glance at Deb's tear-stained face, and Deborah knew him too well to kiss him when he was either intent on business or in sight of a girl. It was happiness enough to Deborah, after a careless word between them, to stand near him, to see the great strong boyish frame, at present even in its strength so loosely knit and jointed, and the brown bony hands, the dear familiar face, the unkempt locks, the wild sombre eyes, that so strangely courted and yet repelled affection.

'Art going back to-night?' ventured Deborah at length, timidly for her.

'Ay, bad luck to it. I hunt to-morrow.'

'Ah, then you will need Bayard, and father has him.'

'King will mount me.'

'Then if father *does* return, I will ride Bayard.'

'I can't squire girls. You must ride with King.'

'I will not.'

'Then I will not have you scampering alone.'

'I will ride with Jordan Dinnage. But you know, Charlie, I can keep up with the best.'

'You can; I'll do you that justice.'

'I don't like to lose you, old Charlie; we miss you sore. I fear, dear love, you are hard put to it for money. Are they *all* better off than you?'

'Oh, I know not and care not. I am well enough.'

Deborah sighed deeply: 'Not well enough for *thee*. But as yet, father is hard pressed; it has been a bad time for the coaching, and father is well-nigh sick of it. If he gets luck he will give up for a spell, and perchance take to it again.'

'What *luck* would you have for him, then?'

'Ah, I know not.'

Charlie smiled somewhat grimly over his gun, but said nothing. Soon Deborah went over to Mistress Dinnage, where she sat glowering with her dark curly head crowned on one side by coquetish scarlet ribbons. They presented a curious contrast, the bailiff's daughter and the baronet's daughter—one sitting with her hands clasped round her knee, in attire bright and gay, gazing

up with a frown beneath her jaunty curls, her dark eyes lowering, and her little red-heeled shoe tapping on the ground; the other pale, subdued, and wistful, her long lorn hair falling about her unheeded and unribboned, and her dress dull in colour and in texture coarse, standing before her gaily attired inferior. As Mistress Dinnage gazed, her manner changed; irritability gave way before Deborah's plaintive eyes.

'You have been crying,' said Mistress Dinnage, in her marvellously brusque independent way.

'You know nought about it.'

'Ay, don't tell me! You have a heartache. I know when you are sorrowing, Lady Deb, an' when you are full of joy. Once, you never knew what sorrow was. Has *he* been worrying thee?' she asked, with a nod of the head towards Charlie.

'He? No! "The heart knoweth its own bitterness." You will do well not to question me, Meg. Come and play.'

That same evening, Sir Vincent Fleming came home late under cover of the darkness, as he always did, and on a swift horse. Deborah flew to meet him; he took her in his arms and kissed her. 'Good-even, Deb. Sweet Deb, has Enderby had visitors?' he whispered.

'Ay, father, the usual ones, whom it is sweet to blind for thy sake, for I had rare promises for Finton. And indeed you tell me, father, that brighter days are in store?'

'Ay, ay, lass; I have found a friend in need.'

'A friend, father?' They were walking through the great hall together, and Deborah hung upon her father's arm and raised her beautiful eyes to his. His own eyes sank. 'Not one o' those false, false friends,' she continued, 'who have oftentimes proved your strongest foes?'

'Nay; sweet Deb. But do not question me further;' and he turned his head restlessly away. 'This is indeed a friend to me and mine.—Deb,' he said, with a sudden bright altered change of tone, 'I have news for thee.'

'What news?' asked Deborah, with eager curiosity.

'Ah, then, you have not heard? Have the lads been here to-day?'

'Yes, father.'

'Well, if they have not told you, you may guess.'

'I cannot, I cannot! Nay, sweet father, news are scarce at Enderby; tell me quickly what has happened.'

Sir Vincent laughed. 'Little daughter of Eve, it relates to your cousin Kingston!'

'What is it, father?' Somehow the music had died out of Deborah Fleming's voice and the ripple from her lips.

'King is betrothed to Mistress Beatrix Blancheflower, the old baron's daughter;' and Sir Vincent laughed heartily, with his head in the air.

'Is it so, father? Well—she is rich and she is pretty. Oh, she is pretty, father!'

'Ay. But the boy is but twenty, and such a rattle-pate. Well, it will pay his debts and be a rise for the family. See that thou dost likewise, Deb,' said Sir Vincent, with playful tenderness.

As they walked, Deborah laid her head on her father's arm, which she was clasping. 'Time

enough for that, father. Dost want to be rid o' me?"

He looked down and smiled; the smile softened the rugged countenance wonderfully. 'Ay, I want to be rid o' thee do I not, my Rose of Enderby? *Thou art not my right hand?*'

'Then let me be thy left. Nay; I will never leave thee, father. I like not marriage and sweet-hearting. Let Charlie wed; *I will love but thee.*'

Sir Vincent laughed. 'Time will change that tune, sweet Deb.'

They sat down by the hall-fire, where Marjory had spread a frugal repast. It passed in silence, for Sir Vincent fell to thinking deeply, and Deborah did not eat or speak at all. After supper, she lighted her father's pipe, then sat down at his feet and laid her fair head on his knees. The fire-blaze flickered over the wide lofty hall; the stag's antlers, the rusty armour, it shone whimsically on all; but Sir Vincent and his fair daughter and the old shaggy deerhound basked in warmth and steady light.

'Dost think Beatrix Blancheflower very pretty, father?'

'Well, yes; but not so pretty as thou.'

'Other folk think not so. She has blue eyes and golden hair. She is not sly nor awkward. She is older by two years than I. O yes, she has the power of always speaking what it pleases her to say; a rare art. But for me, father, my words ever belie my heart; and for what I say one minute, I would fain pluck out my tongue the next.'

'Silly little wench! I have not noticed it in thee. *Thou art thy mother all over, Deb.*'

'Oh, I am glad! But not so good as she?'

'Well, no. Yet thy mother was not over-fond of prayer, Deb, till she began to ail. She was a mad-cap, she was a madcap I tell thee, like thou art; and too fond of me, Deb, to care much for her soul. But at the last God came between us two. Ah me!' Tears dimmed those bold stern eyes, or the look akin to tears.

Deborah said no more. Soon she went up to her little room, slowly, and with dragging steps. 'What has paled my Rose of Enderby?' were words that had been uttered by her father; and they haunted her. She looked in her glass. True, she was pale, but great fires burned in her eyes. What was this mighty sorrow, that weighed like a mountain on the gay careless heart? The girl was afraid. She liked it not. She shrank and trembled like a child, and lay down on her bed in a little coiled heap, and moaned in helpless agony. It was like a young wild deer; and behold, in its swift flight of joy, an arrow quivered in the bounding heart, and it fell stricken, and writhed, and raised its innocent pleading eyes, as if asking what was that grievous pain that drew the life-blood from its heart! Thus through the long, long night Deborah Fleming lay and moaned. She did not pray, she did not weep; but in the morning she was the true Deborah Fleming again; at least the world never knew her aught else; for in one long night Deb tired of sorrow, and her poor little soul longed for sunshine and joy again, and sought them wildly.

CHAPTER THE THIRD.

'And father,' said Deborah, 'I would like May Warriston to come here and stay with me for a

bit; for when you are long away, I am apt to grow lonesome, and Mistress Dinnage cannot always be here.'

'Have May then. You have only to express a wish, sweet Deb, and it is granted. If we had food to feed the guests, heaven knows you might fill the house!'

So May came. They had not met since they were children, and now they are sixteen. A gay greeting passed between them, which was witnessed by Mistress Dinnage, whose heart ached sorely. May Warriston was small and fair; she blushed with every emotion; she idolised and admired Deborah with all her soul; while Deborah loved and petted May for her sweetness and fragile grace. The Warristons and Flemings had always been staunch friends and allies; a Fleming and a Warriston had fought, brothers-in-arms, in the Crusades, and lay beneath their long-drawn effigies side by side.

May was charmed with Enderby; its grandeur, its gloom, its decay, impressed her romantic imagination, and excited her greatly. The funereal shadow of the oaks, the picturesque girl who stood at the gates beneath them, the great stone archway with its carved armorial bearings, the strange gaunt woman who met her at the door, the hall with its quaint stained windows, and the tall pillars ranged across, and the beautiful Deborah Fleming who rushed through the hall to meet her.

After they had dined together, they went all over the house, and explored the damp mouldering passages where the rats fled before them, and the great untenanted chambers; and studied the ancient tapestry with much laughter, and climbed up with a lantern to the garret. Then the girls scrambled out on to the roof, and ran about round the stone coping, the favourite haunt of Deborah and Charlie, and looked over the far-spreading woods, the shining waters, and the flat but fair and emerald land. Then mists and darkness descended over all. And then came a bright and firelit tea in Deborah's pretty room, with the curtained alcove shutting out the bed—and then a long talk over the fire.

'Yes, King Fleming has done for himself,' said May, resting her chin within her pretty hand, as she leaned upon the arm of the lounging-chair. 'I thought not that he would be caught so easily. Did you?'

'I thought not about it at all. Or if I did—well, I thought it *might* be Mistress Blancheflower. You have seen them often together, May?—does she love him truly?'

'Not what I call truly, faith; but then Beatrix has a cold nature at the best of times.'

'How did she win him then, who has such fire?'

'Well, it is coldness that charms these fiery natures, Deb. Why, she treated him half with disdain; anon she would steal a glance, as Beatrix can, as if to lure him on; and when he wooed her, she frowned and was cold again. Take my word on't, Mistress Blancheflower is an arch-coquette. It matters not who it be. Why, she will play her airs on old Dandy Drummond!' And May burst into laughter, in which Deborah joined.

'Oh, I cannot do such things,' said Deborah, grave again, and sighing. 'Yet, 'tis no fault of mine. Were father rich, I would go to France, and get French polish and a maid to dress my hair.

Money gets all things, May; and the accessories of money give confidence and power. Were I rich, I would outshine Mistress Blancheflower!

'You!' cried May. 'Dost not know the moon even under a vapour outshines the stars? Dost know thy beauty, Deb?'

'Why, no. Sweet May, tell me! Am I beautiful? Father and Marjory tell me so; but they are blind, perchance.'

'Why, yes,' said May, laughing, 'you are; yet I like not to tell you so, for fear it should make you vain. You are beautiful as times go. Would that I were half as fair!'

How the maiden blushed. Her heart beat fast at May's simple praise, for Deborah had never believed herself to be beautiful before.

'O say not so, sweet May,' she answered; 'I would fain have your blue eyes and waxen skin and fairy-like figure. Father admires you greatly. Charlie, you have not seen. He is a man now, eighteen, and entered at Granta University.'

'Is he like you? Is he handsome, Deb?'

'Some folks say he is. My heart says there is no one like my bonnie Charlie! Yet he is somewhat of a bear. In Charlie, May, you must look for no courtly cavalier.'

'I like them not!' quoth May; 'of courtly phrases I am sick. But what like is he, this brother o' thine? Describe him.'

'Well, he is giant-tall—almost as tall as King, and may be taller.'

'I love tall men!'

'He cares not for his clothes, and dresses very rough; he has bonnie big eyes, dark and full of fire, that seem to scan you through; a brown face, a noble shapely head, and teeth as white as ivory. This be Master Fleming.'

'I like your portrait. But of Kingston I am afraid; his tongue is sharp as whip-cord. He is no great friend of yours, Deb, your cousin King?'

'And no great foe,' said Deborah, supremely careless. 'Nay—"blood is thicker than water;" I like him well enow; I have nought to say against King.'

Thus they talked, and much about tall men and short, dark men and fair—a deal of nonsense, as girls did then as now.

The next day there was a hunt, and great baying of hounds about Enderby. May would have Deborah go, and bring Kingston and Charlie home. So Lady Deb rode away, with old Jordan Dinnage behind her; and much ado had Jordan on such days to keep Deborah in sight, for hearing the horn and the hounds, she would grow wild, having come of a hard-riding race.

'Bless thee!' muttered Jordan Dinnage, 'thou wilt lead me a-moon-lightin' to-day. I see it in thee, lass! An' if thou doesn't break Bayard's knees or thine own neck, one day, my name's not Jordan Dinnage.—There they be! Hoicks, hoicks! Lady Deb! Gone away!!' And behold the old bailiff (muttering gloomily a moment ago, between twinges of rheumatic pain) would give the view-hollo with a voice like a clarion. But Deborah Fleming was already off like a whirlwind, with a cry of joy, her hair flying. And she led Jordan a dance that day. . . .

'You must come home, Charlie,' said Deborah. She looked happier than any queen. The brush was swinging at her saddle, and Bayard and his little mistress appeared fresh and spirited as the

dawn. All the huntsmen gathered about, and stared at Deborah, for the dawning beauty of Mistress Fleming began to be noised abroad, and the young lads from far and near would come to see the 'Rose of Enderby.' 'Who is she?' was whispered round. 'Why, Sir Vincent Fleming's daughter. They call her the Rose of Enderby.' The best of it was, Deborah was unconscious of it all. The spirit of the hunt was in her; her large gray eyes were luminous with light and life, her hair was afloat in amber clouds. She cared not even for Kingston, in moments such as those.

'You must come,' she urged pleadingly. 'It is early yet, and Marjory has a hunter's dinner ready—a banquet. And besides—I have a fair lady to greet ye, Charlie.'

'Then good-bye!' Charlie turned back his horse. 'Nay, Deb. Who is it? I want no "fair ladies."—But come away from these gaping loons,' he added, his boyish heart swelling with a sullen pride at the attention his sister was exciting; and they rode away together.

'It is May Warriston. Such a little angel! Quite harmless and full of fun, as much fun as Mistress Dinnage.' And then Deborah blushed, and gave a slight imperial bow, for Kingston, splendidly mounted, was now at her other side.

He bowed, with some mock-pleading in his eyes. 'What is this, fair cousin—May Warriston? Nay, Charlie, boy, I must go and see sweet May; she has always a sweet word for me, and sometimes something sweeter and kinder far!' And Kingston, glancing upbraidingly at Deborah's averted face, saw that it was crimsoned with haughty shame, at which sight he was somewhat confused.

'Well, come,' said Charlie, 'and make short work of it, for I am gated at seven; thanks be to old Shand.' So they rode fast home to Enderby; Jordan groaning behind, now that the hunt was over.

Mistress Dinnage stood gravely in the lodge door in the twilight; Kingston smiled and kissed his hand; Charlie Fleming looked not up at all. May Warriston ran out with smiles and blushes, which were not lost on Kingston, who greeted her even tenderly; but May glanced up at the tall dark lad on the bay horse, and felt her foolish little heart flutter, because he bowed without a smile? or because his dark eyes scanned her through? And Deborah looked pleased, seeing May's emotion, and the girls ran gaily in together. Deborah's 'banquet' was spread in the great hall, and great noise and mirth there was over it.

CHAPTER THE FOURTH.

The day came but too soon for May to quit Enderby; the grandmother with whom she lived was ailing, and sent for her. But somehow May could not go that day, and must wait one day more; her trunks were packed, an old and trusty maid had arrived for her; but little May was sick at heart at the thought of leaving Enderby.

Was it love? Maidens did love early and long in those days; love was then a deep abiding passion, not a graceful sentiment to change with every change of raiment. At all events May loved Deborah, and clung to her.

They had been alone all that last long day, though Deborah had run many times to the door. On one of these runs she encountered Mistress Dinnage. 'What art seekin' so anxiously?' asked the latter curtly, even fiercely.

'I will not answer you, Margaret,' said Deborah with calm dignity; 'for the last five weeks you have spoken to me thus, and avoided me in every way. I have not deserved this of thee. A friend has ne'er proved a friend who cannot speak out what rankles in the heart.'

'Speak out!' exclaimed Mistress Dinnage. 'She—she—has all your heart! While I—a poor man's daughter, you care for no more. What matters it, Mistress Deborah! It must be so. Mistress Warriston is a lady, like to you, an' worthy o' you; while I, poor, unscholarly!— And Mistress Dinnage, her pride forgotten, burst into a very passion of sobs. Then the anger and scorn that had flashed from Deborah's eyes at her friend's accusation vanished in a moment at sight of her tears—'Mistress Dinnage!' whom Deborah had never known to shed a tear since their childhood.

'Nay,' cried Deborah, with her hands on the quivering shoulders; 'you know this is not so. You know that neither rank nor wealth nor great lady-friends will ever step between us. Must I tell thee, *silly* Mistress Dinnage, that thou art dearer to my heart than any woman in the world? If you will not believe it, if you cannot see it, go your ways. I am proud as well as you. And if so paltry a matter as difference of station can ever separate, in thought or word or deed, two great good friends, *then* thou'rt not worthy of me, Mistress, or I of thee!' With that, they fell into each other's arms, and each wept a little, and then laughed. Then Deborah returned to May, not seeing Charlie, for whom she had been vainly watching. Charlie might surely have come to do her guest that honour, believing as he did that she was going away that day. But the youth came not.

On the next day, Charlie rode over alone to see to some of his business concerns, and by mere chance Deborah espied him going to the stables. She rushed forth: 'Charlie, May is going away in ten minutes' time; and I have been looking for you so to come and say good-bye. Come in with me, dear boy.'

Charles Fleming stamped his foot and frowned darkly. 'Why, I thought the girl had left you yesterday! Fool that I am to be caught. Deb, you know how I hate maidens, fine ladies. Why can't you let me be?'

'Because Charlie, May has sighed to say you one good-bye. Your roughness wins her heart; and you have been very kind, and seemed so fond of May.'

'Finely you read me!' muttered Charlie; but he followed Deborah into the house, to speed the parting guest. May was standing by the hall window in her soft furs, and her small face was very sad and pale and pleading; there were even tears in her eyes, which she tried in vain to keep back.

'Good-bye, Mistress Warriston,' said Charlie, looking down with his dark eyes, and then away, because of her tears. 'You must come back soon, for Deb loves to have you here;' and he gave a grasp of his hard brown hand.

'I will come; oh, I will gladly come!' faltered May, and then ran to Deborah, and hid her face on her breast. The carriage-wheels were heard; May was half borne out by Deborah, and Charlie stalked behind, looking gloomy, because he knew not how to look. May Warriston gazed

from the carriage-window, and through a maze of tears saw the brother and sister standing under the porch, Deborah kissing her two hands vehemently. Pain was uppermost in that farewell of Enderby; the little orphan May lay back on the cushions, and sobbed as if her heart would break.

WEAVING-SCHOOLS.

IN all the ordinary manufacturing arts, the common practice is to learn by apprenticeships; that is to say, the young who are put to any craft are left to pick up information over a course of several years by imitating the operations of the journey-men among whom they are placed. No teacher sets himself specially to tell them how things are to be done, or how they may be improved upon by an ingenious consideration of results. The craft, whatever it is, takes its chance. In some instances, from generation to generation, it pursues a jog-trot routine; in others it makes advances through the peculiar thoughtfulness of individuals. In numerous cases, the keenness of competition forces on improvements. Manufacturers try to outdo each other. But even in these cases, the actual operatives are only mechanically concerned. They obey orders, but do not originate.

Thoughtful persons have latterly been of opinion that this state of affairs is not satisfactory. They think that instead of the chance and mechanical instruction through apprenticeship, there ought to be a course of systematic teaching by experts in the several crafts, at least those in which great ingenuity and the cultivation of original ideas are required, with a view to national advantages. Hence, schools of practical science and technical instruction, to which public attention has been occasionally drawn. Much has been done in this respect by certain continental countries, in the hope of outrivalling British manufactures; and we may be said to have come to this, that the old chance method of acquiring skill in certain lines of industry will not do any longer. With these preliminary remarks, we proceed to mention that in Belgium and Germany, schools of practical trade-instruction have existed for years in almost every corporate town, under the auspices of the municipality. Now, however, the growing rivalry of these countries with our own in more than one staple industry, has at length impressed British manufacturers with the need of taking similar means to withstand the pressure of such competition. Sharing these views, the promoters of the Yorkshire College some time ago suggested to the Ancient and Honourable Company of Cloth-workers how effectively the wants of the case might be met in the northern counties by providing, as a special department of the college, means for instruction in the manufacture of textile fabrics and designs. The suggestion was accepted in a generous spirit, all the more readily as those who initiated the scheme had personally pledged their own faith in it by subscriptions ranging from fifty to two thousand pounds. Among the munificent contributors of the larger amount were the Duke of Devonshire, Sir A. Fairbairn, and various local firms. Encouraged by the appreciative attitude of those most familiar with the requirements of the woollen trade, the Company at once entered upon this new sphere of active usefulness, granting in the first place an endowment of five hundred

and twenty pounds per annum. Subsequently they offered a further contribution of no less than ten thousand pounds, to provide adequate buildings and appliances for the Textile Industries Department. This extension of their original purpose was mainly due to the immediate and decided success of the experiment. In some measure, however, it was also the fruit of an interesting and valuable Report presented to the Company by Mr John Beaumont, the instructor of the department, after having made, at their instance, a journey of inspection among the weaving-schools of the continent. Accompanied by Mr Walter S. B. McLaren, M.A., Mr Beaumont made a six weeks' tour, during which he visited, chiefly in Germany, twenty-four weaving and seven polytechnic schools. Some of these are exclusively for instruction in weaving, while others are departments of larger technical colleges, as is the case in Leeds. The Report has been printed simply for private circulation, but we are permitted to glean its leading facts and suggestions, before describing briefly how far these are being applied to the new enterprise in the capital of the West Riding.

Among the best schools of the kind in Belgium are those of Ghent and Verviers, in both of which the instruction is free. The only conditions imposed upon students, who must be more than twelve years of age, are that they shall be able to write correctly and know the four simple rules of arithmetic. There are also in Belgium apprentice schools or workshops for apprentices, managed principally by the manufacturers of the different towns, who send work to be done in them. Throughout the whole of France there is likewise a movement in favour of technical education, and among the subjects which it is generally agreed must be taught, theoretically and practically, weaving takes a front place. At such towns as Rheims, Rouen, Lille, Lyons, Elbeuf, and Amiens, weaving-schools have been opened with success, and enjoy the benefit of government aid. In the first two named, what are known as the 'Industrial Societies' have provided, for the use of the manufacturers generally and also of the weaving students, large collections of patterns of cloth of all materials, arranged systematically in books. At Rheims the collection dates back to the year 1800, and is both interesting and useful, as shewing the various patterns and materials in use during this century. In Germany technical education is much more fully developed than in either France or Belgium, every town having its *Gewerbe* or trade-school, giving practical instruction.

At Chemnitz a new *Gewerbe* school is nearly completed, which puts all others into the shade. Its cost will be more than eighty thousand pounds, and it will accommodate between six and seven hundred students, presided over by a staff of nearly forty professors. It possesses a library of nine thousand volumes, upon which is spent three hundred pounds a year, out of an annual grant of seven thousand pounds from the government. In noticing the polytechnic schools, or technical universities which exist in nearly every important town in Germany, the commissioners incidentally mention having seen in the one at Aix-la-Chapelle a number of packing-cases, which they were told contained models of English patent machines, sent as a present by the English government, at the request of the Prince Imperial of Germany. This

of course gives rise to a suggestion that the government might regard home claims with equal favour. The best polytechnic in Austria is undoubtedly that of Vienna, which has no fewer than one thousand two hundred students. The Textile Industries Department of its museum is very complete, comprising specimens of almost every manufactured article in its various stages from the raw material up to the finished piece of goods. In a similar museum at Berlin there are models of almost every machine used in either the cotton or woollen trade. Not only are there models of machines now in use, but also of those which have been long since superseded. The obvious advantage of this variety is that the students see what have been the improvements gradually made in machinery, and it enables them to study the principle upon which the different machines have been worked. The best schools, Chemnitz and Rentlingen for example, have a great assortment of hand-loom, such as treadles, machines, and jacquards—in order to produce patterns, simple and figured, in every material. None of the schools confine their teaching to the manufacture of one class of goods only. Although each devotes most attention to the material and style of cloth chiefly manufactured in the district in which it is situated, yet all teach other branches of weaving; which is thought a material advantage.

To give the students some insight into the practical management of factories, they are in many cases allowed by the manufacturers of the town to visit their mills on stated days. This is unquestionably a great advantage to the students, shewing them on a large scale and from a business point of view those things which they are themselves doing on a small scale. In many of the schools the instruction is free. In those where charges are made, it is found that wherever the fees are low enough, the working men take advantage of the schools, and are thus made into skilful workmen and overlookers. The low fees do not drive away the sons of manufacturers; and the schools which are within the reach of all are therefore much more popular and useful than those which, from the larger fees charged, are more exclusive.

In our own country the object of weaving-schools is much misunderstood, many people having an idea that they are simply meant to teach workmen the management of a loom. To correct such a mistaken impression, it may be worth while to quote the prospectus of the Mülheim School, which describes that institution (a model one) as devoting itself to the task of 'educating overseers and manufacturers in all branches of weaving, and furnishing young men who wish to become buyers or sellers of manufactured goods with an exact knowledge of manufacturing, and therefore with a correct judgment of goods.' By the training which employers themselves receive in these schools, they are able to look after their businesses more thoroughly, and to supervise work for which they would not otherwise be qualified.

With a view to securing these and kindred benefits in the largest possible measure, various suggestions were made by the commissioners for the improvement of weaving-schools opened in this country. Means are not lacking to realise these advantages; but further time is required for the full development of the scheme. Meantime

it is sufficiently proved at Leeds that technical education is by no means a myth, but may have an appreciable influence upon manufactures. Both at the day and evening classes there is a large, sometimes an overflowing attendance of students, chiefly young men of the middle class, who either are or expect to be engaged in textile industries. In order to facilitate the more adequate and efficient fulfilment of its purposes, the college will shortly enter upon the possession of Beechgrove, a suburban estate which the executive council have purchased for their new suite of buildings. At present it occupies temporary but well adapted premises, which, pending the erection of the new college, have had to be once more enlarged, in order that the Textile Industries Department may have the accommodation requisite for sixteen looms. The pupils are assisted to arrange and design new patterns, or to classify and mingle colours with taste and judgment. They also receive instruction as to the mixing, working, and blending of the raw material; how to estimate the quality of water for manufacturing purposes; the proper use of the best ingredients for dyeing; the processes of carding, spinning, and fulling; the operations of weaving, and the mechanism of the loom, &c. In addition to the manipulative work, lectures are given on wool, mungo, shoddy, alpaca, and silk; also on the applications of chemistry to the manufacture and colouring of textile fabrics. The endowment provided by the Clothworkers' Company includes eight scholarships—four of thirty pounds, and four of twenty-five pounds per annum—for which there is a good competition. In other respects also, the appreciative interest and intelligence shewn by the students give encouraging hope of great practical benefit.

The success of the Yorkshire College has stimulated the movement in other parts of the kingdom in favour of this phase of technical education. The School of Chemistry lately founded at Bristol by the same guild of Clothworkers, in connection with the dyeing industries of the neighbourhood, is now in working order, and a textile instructor has been appointed for the Stroud school. Weaving-schools are also being established at Huddersfield and Glasgow, with the prospect of more to follow in other industrial centres. Such measures indicate a widening recognition of the truth, that our craftsmen must be taught to work upon the basis of scientific knowledge, rather than rely so much as heretofore on mere rule of thumb, if our country is to maintain its manufacturing supremacy.

TIM BAYLIS.

WE had anchored in the river Irrawaddi, after a tedious passage up from Melbourne, having on board by way of a crew as fine a sample of Australian desperadoes as ill-luck in her worst temper ever brought together on board one ship. There were men of all possible nationalities, from the swarthy negro to the handsome but treacherous Levantine sailor; the latter by far the more dangerous animal of the two. The natural result of this awkward assortment was the ever-present feeling of mistrust, mutual and deep, that prevailed between these worthies and ourselves; this latter term including those few men that had not deserted from the ship while in Melbourne.

The passage from Australia to any East Indian port is, under favourable circumstances, a journey by no means to be despised. Glorious weather, grand sunsets, a smooth sea, gentle but steady winds, all combine to render this one of the most popular of routes. But with us this had not proved so. Like Ulyssus of old, we longed for the end of our voyage; and the more we desired, so much the farther away did our beloved Ithaca seem to retreat. The time dragged wearily on, and the sense of oppression grew greater.

At our mess-table this was less felt than anywhere else on board; owing mainly to the presence of one, the subject of this little story—dear old Tim Baylis. A noble fellow in form, and a rare combination of gentleness and strength, culture and hardihood. In a word, one of those men marked out by nature to shine starlike in a profession of danger like ours. Frank, generous, and unaffected, he had won our hearts from the moment he had joined the ship; and that trust he had not for an instant declined or betrayed. Fair weather or foul, gale or calm, Tim Baylis was ever the same, clear and decisive in action, and the life and soul of all when off duty. His lightest words and happy jokes formed the watchwords of the men, the magic of his character and his manner weaving a spell around the ship. None saw the danger that threatened, in the miserable assortment of men that called themselves 'the crew,' more than he; none tried so hard to weld the incongruous materials into shape and order more than he; but like many honest open natures, he had underrated the power of the passions he had set himself to calm, and the fire had but smouldered, that under other conditions would have broken forth long before.

But here we were safe off Rangoon, the first stage in the homeward journey accomplished in safety; and anchored in as good a berth in the river as any one could desire. Of course it was dull. Whoever rested at anchor a hundred yards from the shore, and did not find before the week was over, that this sort of thing was the very acme of dullness! The only thing we could do to relieve the monotony was playing everlasting games of whist; alternated by leaning over the poop-rails, and speculating on what the dark and tangled jungle held among its tall grass and leafy branches; the reverie perchance broken by the shrill shriek of some captured or dying animal; telling us in accents unmistakable, that beautiful as the mysterious jungle forest might be to the eye, it certainly would not be a desirable spot wherein to picnic. We had at last discharged our ballast, and liberty to both port and starboard watches had been granted. The short furlough had expired; and the men were turning up rapidly in little batches of threes and fours, of course pursued by the inevitable 'sampan-wallah,' or river boatman, whose frantic efforts to obtain extra 'backsheesh,' usually found a rapid and summary recompense in the decided preponderance of kicks over 'pice' (Anglicè, halfpence), the last resource of impecunious Jack. Contrary to our expectations, most of our men came on board in a singularly sober state, so much so as to excite remark amongst all. It is a time-honoured custom to condone cases of over-refreshment on the various days of 'liberty' during a long voyage. John Tar—as time-honoured 'Jack' is now frequently dubbed—on that day

drops his professional character, and, to use his own most forcible expression, 'lets go the painter,' and enjoys himself after his own peculiar fashion so long as his dollars or rupees hold out.

There had been a whisper floating about for the past two or three days, in that unaccountable way that whispers have of floating; the said whisper coming aft under the fostering care and protecting wing of Isaac the half-caste mess-room steward, thereby increasing twofold in its proportions while under transit, Isaac's powers of imagination being proverbial; and the gist of all this seemed to be that discontent about something reigned paramount in the fore-castle, at least among its foreign occupants. Now, as luck would have it, we had had this sort of thing over and over again throughout the passage, and we had grown rather tired of it all; indeed, it had become too much like the cry of 'Wolf! Wolf!' to have any strong effect on our nerves, especially as nothing had ever come of it but talk, and very 'tall talk' too sometimes; but still no more than—*talk*.

Had there been any real grievance, there would have been some interest displayed; but somehow the 'casus belli' had a knack of vanishing when the matter came to be investigated; hence we had grown rather callous as to these perpetual complaints. Now, however, there seemed something more in the report than usual; but whether this was really so, or only owed its importance to Isaac's over-vivid imagination, it was hard to determine. So feeling secure in our nearness to the shore, we contented ourselves by awaiting some decisive action on the part of the malcontents. As it was, the Captain had gone ashore with the announcement that he intended to accept the proffered hospitality of the agent, a few miles out of town; and Tim Baylis and I were left on board, the former enjoying the dignity of full command.

This was just the time of the change of the monsoon, and evening shewed us that the hitherto calm and unbroken monotony would soon be visited by the demon of Storm in some one of its many phases. Warning banks of inky clouds were perpetually revealed by the brilliant streaks of lurid lightning that played among their depths. Still the ominous calm was unbroken save by the hoarse croak of frogs, eager for the coming rain. Ere long the welcome sound of 'eight bells' told of the end of the day for us; the men were soon mustered and dismissed, the final entry made in the log, and silence soon reigned fore and aft the ship.

Our hammocks were slung, Indian-coast fashion, in various positions under the poop awning; and very pleasant it was to lie at ease in the cool night-air, smoking and chatting. Tim seemed unusually silent this evening, more inclined to speculate and think, than to tell out aught from the fund of anecdote, curious and amusing, that he always was so ready to retail for our benefit.

'Charlie,' he said at length, 'I don't wonder at those niggers being so confoundedly superstitious and ghostly; a night like this makes one feel that there is something, of which we know nothing, at work above and around us. Just look out at those fiery clouds, and answer if there must not be a Power there, compared to which our grandest efforts seem no more than the croaking of yonder frogs.'

I replied generally, that the works of nature always shone forth clearly to those who looked upon them as the tokens of a Supreme Will.

Another blaze of dazzling brightness, resting on us for a moment, leaving us in denser darkness than before. The storm was certainly nearing us rapidly.

'Ah!' he said, referring to the contrast, 'how true a picture of life; that glowing light, just for an instant of time, like our own life, followed by the dense and unknown darkness of death. I am not one to believe in portents, Charlie; but I am sure that in these things, if one only read them aright, there lies much that may be taken to indicate that there is a grand life hereafter of completion and unity in the powers of mind and body, though the truth of it may be kept from us in the darkness of the future. Yet after all it is only in moments like these that a man seems either to care for or notice them.'

My reply was lost in a burst of thunder, the first of any power we had yet heard, and with it came down the rain, as only it *can* rain in the tropics. I ran to the gangway, to be clear of the awning, and saw at once that a hurricane was close upon us. The whirling and eddying clouds flew at a vast pace across the sky; the low roaring of the wind, still very distant, confirmed any doubt on that point. I did not consider that there was any cause for alarm on the ship's account; we were in an excellent anchorage; and most of our 'top-hamper' was down on deck undergoing an overhaul. Still the awnings must be furled; so I hurried below for my oil-skin coat and 'sou'-wester.' Reaching the main-deck, I was startled by the sound of voices coming from a part of the ship where I knew they could have no business. Without pausing to listen, however, I descended the companion-stairs; the voices, now hushed in whispers, following after. At the fore-cabin door I encountered the scared face of Isaac, as white as his dark skin would permit. He was about to say something; but the cry of 'All hands on deck!' from Tim's lips rang out fore and aft; so I rushed on deck without waiting to hear what he had to say. My station, as second in command, being on the fore-castle, I made directly for that point, and awaited the port-watch, in order to let go the second anchor. No one came! Where were the men? I heard voices aft. I saw the quarter-deck awning fly up in the air, released from the side-ropes. The hurricane had struck us by this time; we were leaning broadside over in an alarming manner, and rapidly dragging our single anchor towards the shore. Again I listened; I could distinguish the varied cries; they were not those of men at work. I soon knew. A fierce yell—a wilder shriek, borne along the gale. It was plain that the smothered volcano had broken forth at last. The men had mutinied! Seizing a belaying-pin from out the rail, I managed to knock the gear clear on the 'cat-head,' and thus releasing the starboard anchor, I ran aft, leaving the chain careering wildly over the windlass.

The odds were terribly against us; a set of men, each more reckless than his neighbour, pitted against a few poor fellows, taken at the utmost disadvantage. Added to this, the howling hurricane, the black darkness, and the utter impossibility of any signal being seen or heard twenty yards from the ship. I did not quite understand all this at the moment. I very soon did, however. No shot had as yet been fired, so no alarm could reach beyond by that means. Making for the

indistinct struggling mass of human figures, I tried to reach Tim's side. I could just see him standing on the after-hatch, cutlass in hand, bravely keeping at bay a dozen or more of the mutineers, who vainly tried to force him back over the 'combings' of the open hatchway. In another confused heap I could just distinguish the third officer and boat-swain; how armed, I could not see. My iron belaying-pin proved no bad weapon—short, round, and heavy, it was easily handled, and did good service. After all, one had no real chance against long thin knives in anything like close single combat.

How long this performance would have lasted, and the fearfully unequal conflict been kept up, it is hard to say, when the sound of cheering broke upon us. Pausing in the struggle for a moment, we became aware that the storm had ceased as suddenly as it had begun; in fact it was almost calm. Another instant, and the cheers resolved themselves into men swarming up the sides like bees on every quarter, cutlass in hand, hardly knowing what was the matter. It was soon over. Stepanos Zenos, George Marco, and Pedro Cenci secured in irons to the main-deck stanchions, the rest were soon powerless for much harm. A hurried explanation now ensued. It seemed that after I had rushed up on deck, in answer to the cry of 'All hands!' never heeding the boy Isaac or his scared face, the lad ran up after me, taking with him the cutlass that I afterwards saw in Tim Baylis' hand; in fact he gave it to him without word or comment. Running to the gangway, he had thrown himself into the boat belonging to our old sampan-wallah, Ramoon, who always remained alongside the ship ready for a call. Rousing the old man and seizing an oar, he let go the boat, which, released from the ship, glided swiftly down the stream; struck soon after by the hurricane or north-west squall, they nearly capsized, but managed to reach the mooring-chains of H.M.S. *Pegasus*, moored half a mile down the river. A rope being flung to them they boarded her, the boy Isaac telling his tale in broken accents and incoherent sentences; still, however, the officer of the watch made out enough of the lad's story to know that mutiny, and perhaps murder, were going on a short distance up the river; so without more ado, the order was passed for 'general quarters,' and two boats' crews piped away to 'board and relieve the stranger.' The squall luckily dropping at this time, they soon were alongside of our ship, Isaac acting as pilot, when they gave us the hearty cheer that had so joyed and surprised us.

But where was Tim Baylis all this time? Surely about the ship somewhere. No! We found him at last, lying at the bottom of that fatal hatchway, and a long knife-wound in his side, from which the dark blood slowly oozed. They brought him gently up, and laid him on the after-skylight; the rain had ceased, and the tropical moon shone down on the reeking deck, lending a weird clearness to every object around. He looked very calm, his dark clear-cut features looked very white and awful now.

We all stood around while the surgeon that had come with the relief party from the old *Pegasus* carefully probed and examined the wound. It was no use; his face told us silently there was 'no hope!' that dear old Tim Baylis would soon

be at rest for ever. 'Hush! he is speaking,' Conscious once again, on board the ship he had defended with his life, the spirit of him we had learned to love so well seemed to return to us once again ere it went forth into that unknown 'darkness' he had spoken of so strangely and thoughtfully scarce an hour before. He said a few words to us all, reminding us of the many bright and happy days we had spent in times past together—days that had left their pleasant memories of the foreign shores by which they had been passed, mementos of a time gone by, but still fresh and vivid in our minds. Asking pardon of any, then, he might in thoughtless mirth unconsciously have wounded, and telling us when, in better days and more joyous scenes, we might chance to review the past and those who had peopled it, not to forget poor Tim, lying cold and dead on the banks of the Irrawaddi river. Turning painfully to me, he said in faltering words: 'See my dear mother, Charlie. Tell her all is over. Tell her that though the end has come while far away from her, I did not forget her love. Ask her to forgive my wilfulness, to think of me with pity. And Charlie, don't let those niggers haul me about before I'm buried. Good-bye, old fellow. How dark it is getting!'

We laid him next day in his grave in the European cemetery, under the shade of a spreading mango; a few fellows from the old *Pegasus* and ourselves looked last on his coffin; and before we sailed, had laid a double wreath on the already bright and flowering turf. Reader! should you ever bend your steps to the sacred city of the Great Pagoda, turn aside for a moment from the deepening shadows of its ancient temple, and reading the words on a little marble cross under the branches of the old mango-tree, pause, and think on the noble death of poor Tim Baylis.

THE GIGANTIC MOA BIRD.

THE extinction of many animals that are known to have formerly existed on the earth, is a subject which cannot very easily be explained, while the number of them is greater than at first sight would be supposed. Various species no doubt undergo gradual extinction by changes which deprive them of their accustomed food; but others seem to die out from unknown causes. During the historic period a considerable number of animals have been swept off the British Islands, among which are the bear, the wolf, the Irish elk, &c. In America, during the comparatively short period of its history, various species have vanished, and others are following them. The beaver, formerly so generally spread over the whole of that country, is now only to be found in remote regions. The deer and the moose are disappearing in the same manner. The bison is very much diminished in numbers, and must ere long be extirpated. The mastodon, a creature of enormous bulk, has totally disappeared, although, along with the skeletons of them which have been discovered, there are evidences of their having lived on food derived from plants which are still existing. In other parts of the world, the dodo and the moa have perished within the last few centuries; and the apteryx is undergoing the same fate.

The moa or dinornis was a huge bird, of which

the remains are plentifully found in New Zealand. Within recent historic times, this colony was tenanted, to the almost entire exclusion of mammalia, by countless numbers of gigantic wingless birds of various genera and species, the *Dinornis gigantea*, the largest, attaining a size nearly thrice that of a full-grown ostrich. From traditions which are current among the Maoris, they were fat, stupid, indolent birds, living in forests and feeding on vegetables; while the name moa seems to have been given to them from their peculiar cry. Since remains have been found in great plenty, the investigation of this singular bird is of the greatest interest to students of natural history.

It is to the Rev. Richard Taylor that the first discovery of moa remains is due, which he thus describes: 'In the beginning of 1839 I took my first journey in New Zealand to Poverty Bay with the Rev. W. Williams (Bishop of Waiapu). When we reached Waiapu, near the East Cape, we took up our abode in a native house, and there I noticed the fragment of a large bone stuck in the ceiling. I took it down, supposing at first that it was human; but when I saw its cancellated structure, I handed it over to my companion, who had been brought up to the medical profession, asking him if he did not think it was a bird's bone. He laughed at the idea, and said: "What kind of bird could there be to have so large a bone?" I pointed out its structure; and when the natives came, requested him to ask them what it belonged to. They said it was a bone of the *tarepo*, a very large bird, that lived on the top of Hikurangi, the highest mountain on the east coast, and that they made their largest fish-hooks from its bones. I then inquired whether the bird was still to be met with; and was told that there was one of an immense size which lived in a cave, and was guarded by a large lizard, and that the bird was always standing on one leg. The chief readily gave me the bone for a little tobacco; and I afterwards sent it to Professor Owen by Sir Everard Home in 1839; and I think I may justly claim to have been the first discoverer of the moa.' Mr Taylor continued his inquiries among the natives, who informed him that the moa was quite as large as a horse; that these birds had nests made of the refuse of fern-root, on which they fed; and that they used to conceal themselves in the veronica thickets, from which, by setting them on fire, the natives drove them out and killed them; hence originated the Maori saying: 'The veronica was the tree which roasted the moa.' The natives further mentioned that when a moa-hunt was to take place notice was given inviting all to the battue. The party then spread out to inclose as large a space as possible, and drive the birds from their haunts; then gradually contracting the line as they approached some lake, they at last rushed forward with loud yells, and drove the frightened birds into the water, where they could be easily approached in canoes and despatched without their being able to make any resistance. These moa-hunts must thus have been very destructive; as, from the number of men employed, and the traces of long lines of ovens in which the natives cooked the birds, and the large quantity of egg-shells found on the western shores of New Zealand, a clear proof is given that these birds were eagerly sought for and feasted upon. Thus the poor moas had very little chance of continuing their race.

From a very interesting communication of the Rev. W. Williams, dated 17th May 1872, it would appear that the moa may not yet be entirely extirpated. 'Within the last few days,' he remarks, 'I have obtained a piece of information worthy of notice. Happening to speak to an American about these bones, he told me that the bird is still in existence in the neighbourhood of Cloudy Bay, in Cook's Strait. He said that the natives there had mentioned to an Englishman belonging to a whaling party, that there was a bird of extraordinary size to be seen only at night on the side of a hill near the place; and that he with a native and a second Englishman went to the spot; that after waiting some time they saw the creature at a little distance, which they describe as being about fourteen or sixteen feet high. One of the men proposed to go nearer and shoot; but his companion was so exceedingly terrified, or perhaps both of them, that they were satisfied with looking at the bird; when after a little time it took the alarm and strode off up the side of the mountain.'

In the *Greymouth Weekly Argus* published in New Zealand in 1876 there appeared a letter signed R. K. M. Smythe, Browning's Pass, Otago, describing in a very detailed manner the capture of two living moas, a female eight feet high, and a young one three feet shorter. The writer finishes his account of their capture by remarking that he has little doubt that he will be able to bring them both alive to Christchurch. It is therefore to be hoped that living representatives of the genus *Dinornis* still survive. Feathers of the bird have been also found in a state of preservation sufficiently good to shew that they possessed an after-shaft of a large size; and at the same time tradition and the condition in which the bones are found, retaining much of their animal matter, tend to shew how lately the bird formed part of the existing fauna of the country. If the letter be genuine, it cannot be long before ornithologists, of whom there are several of no mean repute in New Zealand, will be able to satisfy themselves on the subject.

An additional reason for supposing that these magnificent birds existed not long ago is found in the fact that specimens of their eggs have been preserved. In the volcanic sand of New Zealand, Mr Walter Mantell found a gigantic egg, of the magnitude of which he gives us a familiar idea by saying that his hat would have been just large enough to have served as an egg-cup for it. This egg must have been one of a *Dinornis* or a *Palapteryx*, and although its dimensions are considerably greater than the egg of the ostrich, still it is smaller than might have been expected from a bird from twelve to fourteen feet high. It is well known that the egg of the New Zealand apteryx, to which the moa bears a very close affinity, is one of dimensions that are quite surprising in proportion to the bulk of the bird. The apteryx is about as big as a turkey, standing two feet in height; but its egg measures four inches ten lines by three inches two lines in the respective diameters. To bear the same ratio to the bird as this, the egg of the *Dinornis gigantea* would be of the incredible length of two feet and a half by a breadth of one and three-quarters.

In the Museum at York there is a complete skeleton of a moa, which besides feathers, has the integuments of the feet partly preserved; from

which it is evident that the toes were covered with small hexagonal scales. A specimen has also been sent by Dr Haast of New Zealand to Professor Milne-Edwards, which is to be seen in the Museum of Natural History at Paris.

THE BRIDGE POOL.

AMONG the many rivers and streams watering the south-west of Ireland and falling into the Atlantic, few present greater attractions to the wandering angler than the bright little Caragh of County Kerry. This beautiful salmon river takes its rise in Lough Cloon, and after a rapid winding course of seven or eight miles through the lovely valley of Glencar, at length falls into Lake Caragh, one of the finest and most picturesque sheets of water in the south of Ireland. The river leaves Lake Caragh at its northern extremity, and after gliding for two or three miles farther through a deep rocky glen, finally discharges itself by an arm of the sea into Dingle Bay.

Lough Cloon where, as already mentioned, the river Caragh rises, is a small but very deep mountain lake, and surrounded on all sides by heather-clad hills, which gradually slope down to its rocky shores. Farther away, the mountains become more precipitous, till at length the eye rests on bare cliffs and towering crags which rear their snow-capped peaks to the skies, and complete a picture which for wild grandeur it would be difficult to surpass. On a still day, the silence around the lake is peculiarly impressive if not awe-inspiring; not a breath of air ruffles the dark waters of Lough Cloon; not a sound catches the ear but the distant bleat of a goat from the opposite crags, the shrill cry of the curlew from the moor hard by, or the sullen plunge of a leaping salmon far away in the loch.

To the ornithologist this wild spot possesses unusual attractions. Here he may at times see the golden eagle soaring aloft, a mere speck in the sky; or perchance observe a pair of the royal birds beating the hill-side in search of mountain hares to bear away to their eyry on the steep side of old Carrantuohill. Such, comparatively speaking, rare birds as the peregrine falcon, the buzzard, raven, and many others that might be named, are also to be met with, and have their nests among these Kerry mountains, and afford a pleasing study to the young naturalist.

But to return. The upper part of the Caragh river, from Lough Cloon to where the stream is spanned from bank to bank by a picturesque old arch called Bealalaw Bridge, offers few inducements to the salmon-fisher, on account of the shallowness of the water; though doubtless after a flood, when the fish are moving up stream, there are two or three casts well worth a trial. Immediately below the bridge, however, and stretching almost in a direct line towards the south-west through a deep rocky gorge, lies the celebrated Bridge Pool. This far-famed and somewhat singular salmon-cast is of great length,

perhaps reaching two hundred and fifty yards from end to end, but is nowhere broader than fifty feet. The sides of the pool are for the most part steep and jagged, rising almost perpendicularly to a considerable height above the edge of the river. The water is dark coloured and of great depth, so much so, that on the brightest day it is impossible to see the rocky bottom. At the top of the pool, where the river surges through the narrow strait below the bridge, there is a considerable current; but lower down the stream gradually dies away, till at length the pool becomes almost dead water, flat and motionless.

The Bridge Pool, on account of its great depth and rocky bottom, is a favourite resting-place of the salmon. Here many an exhausted fish, after escaping the deadly nets so murderously plied by the fishermen of Lake Caragh, and surmounting the numberless obstacles and dangers besetting its path up from the sea, at length reaches a retreat where it can recruit its strength, and thus be enabled later to push on to the end of its journey. Even here, however, the poor wanderer is not altogether out of harm's way. Though safe from the fangs of prowling otter and beyond the reach of poucher's net or cruel leister, it is ever in danger of being insnared by the angler's glittering lure. And see! here comes one of *Salmo salar's* deadly enemies, a Glencar fisherman, accompanied by an aged guide, a veteran follower of the craft, bearing his long shining rod. Let us watch their movements, as they consult together what is to be the fly wherewith to tempt from his hiding-place one of those noble fellows lying at anchor in the pool hard by. They have chosen a good day for their sport. There has been rain in the night, not a heavy downpour, but sufficient to colour the water a brown tinge. The morning is cloudy, with occasional gleams of sunshine; and a fresh breeze from the south-west blows steadily through the old arch, and ruffles the surface of the pool from end to end.

And now the pair have completed their preparations, and the angler, rod in hand, carefully descends the steep bank to a small sandy bay just below the bridge, from whence he can command the upper reach of the cast. The fly, skillfully directed by the wielder of the rod in a diagonal direction down stream, falls light as thistle-down close to the far bank, and the current brings it across in a bold sweep to the near side. The line is lengthened a few feet, and the process repeated again and again, till presently the foot of the rapid is reached, but with no good result. After a brief consultation the two now cross the bridge, and skirting the far side, presently approach one of the best casts in the river. Nearly opposite to where they are now standing, a giant rock boldly projects into the stream, and just below, where the dark water slowly curls round the point of the stone, lies a favourite lodge for a 'fish.'

Commencing a few yards above this spot, and keeping well out of sight as he advances, the angler carefully covers each foot of water, till presently his fly slowly glides past the projecting angle of the rock. Ha! What was that bright

flash of silver, swiftly darting upwards from the depths of the black abyss? It is the monarch of the pool, a glorious silvery sixteen-pounder; in a second he clutches the treacherous bunch of shining feathers concealing the barbed hook; and with a flourish of his broad tail, down he goes to his lodge again; but now the angler plays his part, and with a firm stroke of the rod drives the hook deep into the fish's jaws. Away goes the affrighted creature swift as lightning down the pool. The reel groans as it rapidly pays out the line, and the rod is raised over the shoulder till bent nearly double; but on goes the gallant fish despite the tremendous pressure put upon him, and then suddenly rising to the surface, he makes a supreme effort to release himself by leaping high in the air; in descending he strikes the taut gut-cast with his tail, dashes the hook from his mouth, and once more free as air, dives to the bottom of the river.

And how does friend Piscator bear himself the while? Who but a salmon-fisher can realise the bitterness of that moment when after a splendid burst by a plucky fish, through some blunder or accident his line, all limp and dragging, comes slowly back to him! But, my friend, you have just been taught a good though severe lesson: had you been ready at the critical moment, and slackened the line, by adroitly lowering the point of your rod when that sixteen-pounder practised so dangerous a manoeuvre, the probabilities are that the effort of the fish would have proved abortive, and the slender link between you would not have thus been abruptly severed. But it is all over now, and you may rest awhile from your labours, and try to calm your feelings with a pipe of tobacco, while the veteran your companion moralises in your ear on the truth of the motto, *Nil desperandum*.

Presently a dark cloud rolls up the valley, and heavy drops of rain give notice that a shower is at hand. Our friends yonder are again bestirring themselves, and once more the heavy rod is brought into play; but fortune seems to have deserted the fisherman, for in spite of all his endeavours, yard after yard of the best water is left behind without sign of a rising fish, till at length he reaches the far end of the pool, where the river gradually widens, and the dark water changes to a brighter hue, as it glides more rapidly over a shallower bed. Here there is one last chance for the angler, and if he can only pitch his fly artistically under yonder dark holly-bush, he may yet gain the day. It is a long cast; but the fisherman throws a fine line, and the fly admirably hove skims through the air and drops like a natural insect just where the little holly-tree overshadows the water. Again that glimpse of a silvery form mounting swiftly upwards to the surface; and mark the swirling boils, indicating the rise of a heavy fish. There is a pull at the fly; the angler sharply raises the point of his rod, and once more he has hooked a lordly salmon. Again the gallant rush, the dangerous somersault, the determined struggle for dear life; but the tackle is good, the barbed steel has taken a firm hold, and all is of no avail; gradually the fisherman gains the upper hand, and inch by inch reels in the quarry, till presently the still struggling but exhausted prize lies gasping at his feet. The old man steals cautiously forward, and all trembling with excitement, approaches the water's edge; he stoops, makes a quick sure stroke

with the gaff hook, and the next moment uplifts a noble fish and casts him on the sward.

But we will leave them to exult over their victory; for see! it is time to be moving; evening draws on apace, and the sun is already sinking behind the blue Kerry mountains.

INDIAN BORDER WARFARE.

THE Indian wars in the United States are a scandal to civilisation. These wars have nearly all a similar origin. The federal government by treaty settles groups of Indians on certain lands which they are to occupy exclusively in perpetuity. In the face of this arrangement, portions of the lands are taken possession of by white squatters, and no redress can possibly be obtained from the government authorities at Washington. In short, the Indians are systematically cheated, and on their taking up arms in their own defence, a savage war ensues. Circumstances involved me in one of these wars in 1874. I was accompanying a supply train from Camp Supply, a frontier post, to an expedition operating against hostile Indians. This expedition was organised at Fort Dodge, Kansas, in the summer of 1874, to subdue the Comanches and Kiowas, who had broken out on the war-path, and were committing depredations all along the Kansas border.

We left Camp Supply, to join the main command, at daylight on the 6th of September with a train of thirty-six six-mule wagons. Counting escort, teamsters, and one or two outsiders like myself, we were seventy-three in number. For the first three days no signs of Indians were seen; but every precaution was taken against them by frequently practising the teamsters in forming 'corral'; so that in the event of an attack there might be no confusion. The word 'corral' (a Spanish word, signifying an inclosure for cattle) is also used on the plains as a term for the elliptical or circular form in which a train of wagons is arranged to resist an attack by Indians; and in order that our position in the fight may be better understood, I will explain how it is formed. The teams are numbered from front to rear each morning. At a given signal all odd numbers move to the right, and even numbers to the left. When the two columns thus formed are, say, twenty or more yards apart, according to the ground and the size of the train, the leading wagons halt, and the others close up. They can then move on in parallel columns until so closely pressed by attacking Indians as to be obliged to form the 'corral' itself. To do this, the two leading wagons turn and approach each other, passing until their teams lap, when they halt, the next wagon in each column being directed so as to bring its team inside and just lapping the wagon in front. The opening is between the rear ends of the last two wagons. A 'corral' thus formed without a mule unharnessed, makes a very good defence, the mules of each team being more or less protected by the wagon in front.

To return to my story. Our route lay towards the Staked Plains, in the north-eastern corner of Texas. The Indian summer was in all its glory, and the pure bracing prairie air put us in the best of spirits. No anticipation of coming evil

disturbed our minds. The hostile Indians were supposed to be on the other side of the main command, scattering in all directions before its advance. But however easy we might feel on that score, none of the usual precautions for the safety of the train were neglected, remembering the simple rule of the plains: 'If you think there are no Indians near, then is the time to be especially on your guard.' The Indians are wily and very patient, and will hover about and watch you for days and days to find you relaxing your vigilance, and at length off your guard. They see and know full well when you think they are not near. That is just the time when, as a panther which has patiently watched its prey, they make their spring. After having camped on the third night, our suspicions were aroused that Indians were in the neighbourhood by the restless behaviour of the mules. Every frontiersman knows that a mule will smell Indians and shew signs of fear long before their approach can be discovered by a human being, and the knowledge of this fact tended to increase our watchfulness.

Next morning the scouts who went out to reconnoitre returned with the intelligence that they had found fresh tracks of Indians, who had evidently been all round us during the night. This was not pleasant news; but 'forward' was the word, so we harnessed up, and proceeded on our journey, merely taking the additional precaution of forming the wagons into two parallel columns—the first step towards forming 'corral,' as I before explained. While we were crossing the 'divide' (intervening country) between the Canadian and Washita rivers, single Indian vedettes were seen at a great distance off; and on approaching a ridge which crossed our route, a small party of mounted Indians appeared on its crest. As soon as we reached a water-hole, the train was halted, mules watered, and kegs and canteens filled—a fortunate suggestion of our wagon-master. The train was now well closed up, and skirmishers thrown out on both sides parallel to it. Having done this, the march was resumed, and the attack of the savages calmly awaited.

We had not long to wait. At about three in the afternoon, at a place a mile north of the Washita river, just as the train had cleared a very deep and bad ravine, we were fiercely charged upon our right and rear by a mass of Indians, about whom were as many more in open order. They rode down on us with a ringing war-whoop to within fifty yards of the muzzles of our rifles, filling the air with their terrible yells; their object evidently being to stampede the mules and cattle of the train, and then, in the excitement and confusion that would follow, to massacre the escort and teamsters. Finely mounted, in full war-paint, their long scalp locks braided with feathers, with wild whoops and exultant shouts, on they came. It required our utmost efforts to steady the teams and get the train 'corralled.' The cool and determined behaviour of the escort at this moment perhaps decided the fate of the train. The corral was not yet completed, and the rear of the train was on the verge of a stampede. Not a man flinched, but coolly waiting until the Indians were within short range, poured a volley into their ranks, which cooled their ardour, and they swerved off to the left. As soon as the savages found that their attempt at stampeding had failed, and that

our corral was formed, they followed a new plan of action, which was not to charge in a body, as before, but for each warrior to select his own time and mode of attack. This is the usual method of fighting among the Indians of the plains, and is termed 'circling.' First the chiefs led off, followed at regular intervals by the warriors, until there must have been five or six hundred riding in single file round us in a ring as rapidly as their fleet-footed ponies could carry them. Savages erect on their ponies, with shining spears and flaming blankets, and lofty fluttering head-gear, dashed along the ridges with piercing yells, appearing and swiftly disappearing, shewing portentous against the sky in the slanting sunlight. It became a wonderful display of their marvellous powers of horsemanship. They would throw themselves over on the sides of their well-trained ponies, leaving only one hand and foot exposed to our aim, and in this position would deliver their fire over or under the necks of their ponies.

We saw several Indians and ponies knocked over by our fire; but how many were killed we were unable to find out, as directly one of their number was shot, a dash would be made by others to carry his body out of danger of falling into our hands. They will risk a dozen lives to save the scalp of a fallen comrade, for without it, according to Indian belief, he is debarred from entering the 'happy hunting-grounds.' A striking instance of their anxiety in this respect occurred during the fight in the case of a wounded Indian who was lying on the slope of a hill facing us. They tried all manner of dodges to recover his body, and eventually succeeded. The fallen man was a chief, as we could see by his extra-fine trappings; and our men, anticipating unusual efforts to carry him off, concentrated their aim on the spot where he was, so that no one could get near the place. The Indians first tried to divert our attention by sending out a warrior to ride in an opposite direction, waving an old cotton umbrella, formerly the property without doubt of some waylaid emigrant. A childish trick, but thoroughly Indian-like. Finding this ruse did not answer, they covered a pannier with buffalo hides, and an Indian began pushing it down the hill before him, using it as a shield; but our bullets went through and through this cover, so he crawled back again, apparently unhurt. Then they rolled a number of buffalo robes into a huge roll, and fastened lariats to each end, so as to pull it back as soon as the Indian creeping down behind it had secured the body. This armour we were unable to penetrate, so they succeeded in recovering their chief.

At dark, the Indians ceased firing and withdrew for the night. All hands at once set to digging. Hands, bayonets, and knives were brought into requisition, and rifle-pits were soon made and fortified with forage sacks and everything available. No firing occurred on this night. Whether the Indians dug also I cannot say, but next day they had shelter. In the darkness, they approached to within speaking distance, and addressed us in language more forcible than complimentary, announcing that they had 'heap Comanches and Kiowas,' and would have 'heap scalp in the morning.' They taunted us with cowardice, telling us not to skulk like wolves, but to come out and fight like men; an invitation which I need not say we declined. Those of

our scouts who understood the Indian language answered their abuse with the choicest epithets in a plain man's vocabulary, and worked themselves up to such a pitch of rage and excitement, that we could hardly keep them from going out to fight the red-skins single-handed. During the night we held a council of war; and considering the lives of the wounded in danger from their miserable surroundings and want of medical treatment, and believing that the main command would not be likely to ascribe our delay to its true cause, it was determined that an attempt must be made by some one to break through the surrounding Indians and reach Camp Supply, to bring us relief. It was a perilous mission, and required a man of undaunted courage, calm judgment, and unflinching resolution, besides having a thorough knowledge of the country, as most of the journey would be made in the darkness of night, to avoid wandering parties of Indians, who would be on the alert to cut off any one going for assistance. A man possessing these qualifications, a brave and shrewd scout, came forward and volunteered for this forlorn-hope; and at the darkest time of night, he quietly started out on his long and perilous ride to run the gantlet of our savage enemies. We could hear the whoops of the red-skins when they discovered him and started in pursuit; but as to whether he escaped or not, we could only fear and hope.

Next day the fight was renewed by the Indians, and actively continued on both sides with lulls and short interruptions, and by spurts at night, until the morning of the 12th. Several were wounded, the lieutenant of the escort amongst the number, and our chances were beginning to look desperate. The torments of thirst too were now added to our other sufferings. We all knew that it would be impossible to hold out much longer. Visions of torture and a cruel lingering death began to overshadow our minds with dark forebodings, when, to our unspeakable joy and relief, about noon on the 12th the greater portion of the Indians withdrew from the fight, crossed the Washita^a river, and disappeared over the prairie beyond; and were shortly afterwards followed by the remainder, after firing two or three spiteful volleys at us as a parting salute. We could only account for their sudden departure on the supposition that their outlying scouts had discovered signs of white men coming to our assistance; which happily proved to be the case. Although the Indians had all now departed, we were in such a helpless condition with our wounded, and twenty-two mules disabled, that we could not move the train without reinforcements, so had to make up our minds to another night of watching and suspense. The following morning the sun rose with unusual magnificence, like a rainbow of promise to our anxious spirits. Every eye eagerly scanned the horizon until faint shadows could be discerned, which gradually developed into mounted men approaching us. Were they white men or more Indians? was our anxious query. Each minute seemed an age until they were sufficiently near for us to recognise the familiar blue blouses of the cavalry; and before long a company, headed by the brave scout, galloped up to our hard-fought battleground. The scout, after leaving us, had been chased from the start, and lost all his weapons in consequence of his horse falling on rough ground;

but his pluck and shrewdness enabled him to elude his pursuers and reach Camp Supply. On his arrival there with the intelligence of our condition and peril, a company of cavalry with a surgeon was promptly hurried off to our rescue, and travelled the distance of over seventy miles without a rest. The dangers and anxieties of the last few days were now happily at an end, and death or torture no longer stared us in the face.

A HINT TO YOUNG NOBLES.

The *Times* lately observed that our young nobles would do worse than lay to heart the following words, given by Mr Froude in his *Short Studies from Great Subjects*: 'Amusement is the wine of existence, warming and feeding heart and brain. But amusement, like wine also, if taken in excess becomes as stupid as any other form of vulgar debauchery. When we read of some noble lord, with two of his friends, shooting two thousand pheasants in a week, or that another has shot four hundred brace of partridges to his own gun in a day, we perceive that these illustrious personages have been useful to the London poulterers; but it is scarcely the work for which they are intended by the theory of their existence. The annual tournament of doves between Lords and Commons at Hurlingham leads to odd conclusions about us on the continent. Every institution—even the institution of a landed aristocracy—is amenable to general opinion, and it may have worse enemies than an Irish Land Act.'

SUNSET.

MELODY to ancient air
Has touched my soul. O hand so fair
That hymned it forth,
In the golden sunset there,
Of noble worth.

Feeble, poor, and old am I.
What is this life? Alas, how nigh
Seemed it to fate;
When the song I used to try
Came whispering late.

Tears are gauge of purest mind,
Drop e'en a few the maimed and blind:
I loved that song—
Mother sang it, and the wind
Swept soft along.

As I think of saintly face,
The touch of tender loving grace,
I silent turn
Where the sunbeams leapt—no trace
To find no bourne.

So leave I the sunset song,
And hie me home to where I long
To bow my head;
Blessed the hand that struck among
Chords long since dead,

Bringing back the golden time
Of love and hope in its familiar rhyme;
The corn in ear—
Breath of the bee-swarmed murmuring lime,
To cottage dear.

BURIAL ECCENTRICITIES.

IN all times and countries there have been queer notions about burial. We here offer to our readers a few instances of this kind of eccentricity.

Mr Wilkinson, one of the founders of the iron manufacture in Great Britain, loved iron so well that he resolved to carry it to the grave with him. He had himself buried in his garden in an iron coffin, over which was an iron tomb of twenty tons' weight. In order to make all right and secure, he caused the coffin and tomb to be constructed while he was yet alive; he delighted to shew them to his friends and visitors—possibly more to his pleasure than theirs. But there were sundry little tribulations to encounter. When he died, it was found that the coffin was too small; he was temporarily laid in the ground while a new one was made; when buried, it was decided that the coffin was too near the surface, and it was therefore transferred to a cavity dug in a rock; lastly, when the estate was sold many years afterwards, the family directed the coffin to be transferred to the churchyard. Thus Mr Wilkinson had the exceptional honour of being buried three or four times over. Mr Smiles tells us that, in 1862, a man was living who had assisted at all these interments. Mr Wilkinson was quite pleased to make presents of iron coffins to any friends who wished to possess such mementos of death and iron. In a granite county such as Cornwall, it is not surprising to read that the Rev. John Pomeroy, of St Kew, was buried in a granite coffin which he had caused to be made.

Some persons have had a singular taste for providing their coffins long beforehand, and keeping them as objects pleasant to look at, or morally profitable as reminders of the fate of all, or useful for everyday purposes until the last and solemn use supervenes. A slater in Fifeshire, about forty years ago, made his own coffin, decorated it with shells, and displayed it among other fancy shell-work in a room he called his grotto. Another North Briton, a cartwright, made his own coffin, and used it for a long time to hold his working

tools; it was filled with sliding shelves, and the lid turned upon hinges. It is said that many instances are met with in Scotland of working men constructing their own coffins 'in leisure hours.' Alderman Jones of Gloucester, about the close of the seventeenth century, had his coffin and his monument constructed beforehand; not liking the shape of the nose carved on his effigy on the latter, he had a new one cut—just in time, for he died immediately after it was finished. One John Wheatley of Nottingham bought a coffin, and filled it with clove cordial; but he brought himself into bad repute by getting drunk too frequently, for his coffin became to him a sort of dram-shop. A young navy surgeon, who accompanied the Duke of Clarence (afterwards King William IV.) when he first went to sea as a royal midshipman, rose in after-life to an important position at Portsmouth; he had a favourite boat converted into a coffin, with the stern-piece fixed at its head, and kept it under his bed for many years. A married couple in Prussia provided themselves with coffins beforehand, and kept them in a stable, where they were utilised as cupboards for the reception of various kinds of food; but the final appropriation of the coffins was marked by a singular *contre-temps*. The man died; the widow packed the contents of both coffins into one; while the body was deposited in the other. By some mishap, the coffin full of eatables was lowered into the grave. Next day the widow opening the lid of the (supposed) cupboard, was scared at finding the dead body of her husband. Of course the interment had to be done all over again, with an interchange of coffins.

The custom of being buried in an erect position has been frequently carried out. Ben Jonson was buried upright in Westminster Abbey, a circumstance which gave occasion for the following lines in the *Ingoldsby Legends*:

Even rare Ben Jonson, that famous wight,
I am told is interred there bolt upright,
In just such a posture, beneath his bust,
As Tray used to sit in to beg for a crust.

Military heroes have in more cases than one been buried by their men in upright positions on

the battle-field, sometimes lance or spear in hand. One such was found at the Curragh of Kildare; on opening an earthen tumulus, the skeleton of an old Irish chieftain was seen upright, with a barbed spear in or near one hand.

It is of course quite easy to bury in an upright posture, by setting up the coffin on end; but where, as in many recorded instances, the body is placed in sitting posture, coffins were of necessity inadmissible. When the Emperor Frederick Barbarossa opened the tomb of Charlemagne at Aix-la-Chapelle, he found the body of the great man seated on a kind of throne, as if alive, clad in imperial robes, bearing his sceptre in one hand and a copy of the Bible on his knees. At Shore-ditch churchyard, some years ago, a tomb could be seen from the high-road, placed there by a quack doctor named Dr John Gardiner. Or rather it was a high head-stone, with an inscription denoting that the inclosed spot was his 'last and best bedroom;' he had the tomb and the inscription prepared some years before his death, and was (so rumour stated) buried in a sitting posture; but on this last point the evidence is not clear.

Some folks have been buried with a mere apology for a coffin. Such was the fate of Mrs Fisher Dilke, during the time of the Commonwealth. Her husband, Mr Dilke, did not seem to regard her remains as deserving of a very high expenditure. He caused a coffin to be made from boards which lined his barn. He bargained with a sexton to make a grave in the churchyard for one groat; two groats cheaper than if it had been in the church. He invited eight neighbours to act as bearers, for whom he provided three twopenny cakes and a bottle of claret. He read a chapter of Job to them while all was being got ready; then the cakes and wine were partaken of, and the body carried to the churchyard; they put her in the grave, each threw in a spadeful of earth; and the bereaved husband and his neighbours retraced their steps. Another instance of an apology for coffins was that near Horsham, in an old mansion which had been a nunnery; when, on one occasion, the kitchen floor was taken up, there were found twelve skeletons all in a row, each between two planks; they were supposed to have been nuns.

And some folks have been buried without any coffin at all. A military officer, some half-century or so ago, directed by his will that his body should be opened by medical men, bound round with cere-cloth, and interred without a coffin in a particular part of his park. Acorns were to be sown on the spot, the most promising plant from which was to be allowed to grow there, 'in order,' as he said, 'that his remains might be useful in nourishing a sturdy British oak.' He left a legacy to his gardener to weed and water the plant. A goodly-sized oak-tree now marks the spot. This reminds one of the strange burial, or rather absence of burial, in the case of Jeremy Bentham, the celebrated jurist and philosopher. In accordance with

his will, a head of wax was affixed to his skeleton (after dissection); the figure was stuffed to the proper size, and clad in Bentham's own garments; he was placed seated in his own arm-chair, with his own walking-stick in one hand. A wag made a very whimsical anagram out of this, by simply transposing two letters in Jeremy Bentham's name — 'Jeer my bent ham.'

Miscellaneous instances crowd upon us of burial without coffins. There is a parish in the Isle of Thanet the register of which contains entries of eightpence for burying in a coffin, and sixpence without a coffin; and in the register of an adjoining parish (more than two centuries back), eightpence 'in a coffined grave,' and sixpence 'in a sheet.' About a century ago, in Dorset, a gentleman directed that his uncoffined remains should be buried ten feet deep in a particular field lying near his house, and the field to be then thoroughly ploughed over, as if to obliterate him as completely as could well be the case. The family of the St Clairs of Rosslyn were for many generations (the men at any rate) buried without coffins. The latest of such burials took place towards the close of the seventeenth century. When the vault was next opened, the body of Sir William St Clair was seen lying in his armour with a red velvet cap on his head; nothing was decayed but a part of the white fur-edging to the cap. In some parts of Ireland it was at one time customary to carry the body to the grave-side in a coffin, upon which the body was taken out and reverently deposited in the earth. There was one Augustinian abbey graveyard in particular, near Enniscorthy, in which certain families were generally buried in this fashion, the graves being scrupulously prepared with boards, earth, sods, and grass. It is said that the Superior of the first Cistercian abbey founded in England since the Reformation lies buried in this fashion in the chapter-house of the abbey in one of the midland counties. Mr Thomas Cooke, a merchant who had well befriended Morden College, Blackheath, directed that his body should be buried in a winding-sheet, *minus* coffin, in the college grounds.

And as some people have been buried without coffins, so have there been instances of coffins buried without people. Fraud, more or less, may be suspected in such cases. About a dozen years ago the death of a foreigner was entered in the register of an Essex parish on the faith of a medical certificate, apparently authentic; a coffin was bought; and a grave ordered to be dug in a Roman Catholic graveyard. The funeral, or a funeral, took place, all in decent order. A few weeks afterwards a claim was put in by the widow for a hundred thousand francs, due from an insurance office. The (alleged) deceased was known to have been a fugitive fraudulent bankrupt. The aid of the detective police being obtained, the grave and coffin were opened, and—no corpse was there. The rascal had made out the certificate of his own death, ordered his own grave and coffin, and

followed his own coffin to its last home as chief mourner!

With or without coffins, many persons have been buried in spots other than churchyards or graveyards; such, for instance, as in their own gardens, farms, parks, or plantations. There is a family residence in Northamptonshire marked by the singularity of having a coffin placed as it were a table in a summer-house. Sir William Temple, before his death in 1700, ordered his heart to be inclosed in a silver casket, and buried under a sun-dial in his own garden at Moor Park, opposite a particular window. Where the body was interred we have no record. William Liberty, a brick-maker in Herts, was buried in a tomb constructed by himself at the side of a lonely footpath across a field; and room was afterwards found in the same tomb for his widow. Sir James Tillie, of Pentillie Castle, Cornwall, was at his own desire laid under a tower in a summer-house in a favourite part of his park. Baskerville the printer was buried under a windmill near his garden; a dancing-master in a plantation near Macclesfield; a barrister beneath a tower which he had built at Leith Hill, Surrey; a Yorkshire squire in his own shrubbery, 'because he had passed some of the happiest hours of his life there;' a shepherd of the Chiltern Hills on the chalky slopes of the hills themselves, with an inscription cut in the grassy covering. The wish of a captain in Cromwell's army to bury his favourite charger in the churchyard of Houghton-le-Spring, was frustrated; whereupon he had it buried in his own orchard, and left orders that he himself was to be buried by the side of the horse. The editor of a Newcastle journal was buried in his own garden; and a Northumbrian gentleman under a tomb in his own orchard. Körner, the German soldier-poet who fell at Gadebusch, was buried on the spot under an old oak; and many military men have found a similar resting-place.

Many queer stories are extant, resting, however, on tolerably good authority, of bodies being left unburied, or in some way or other kept above-ground, in the hope of cunningly defeating some law or other. The old stage-coachmen on the Great North Road, when driving through Stevenage, were wont to point to a barn in which the body of a former owner, Mr Trigg, was kept; it was inclosed in lead, and placed upon a beam of the roof. The gossips of the neighbourhood had two theories to explain this. One was to the effect that Trigg had expressed a desire that his body should be kept there 'until the day of judgment;' the other, that he believed he would return to life again thirty years after his death, and left his property subject to this contingency. He died in 1721. After the thirty years his representatives 'gave him three days' grace,' then buried him, and finally disposed of his property. Just about a century ago, a legacy of twenty-five pounds a year was left to a woman 'so long as she remained above-ground.' Her husband, on her death, put a crafty interpretation on these words; he rented a small room in a neighbour's house, and kept the body there in a coffin during the long period of nineteen years, receiving the annuity because the woman was still 'above-ground.' A gentleman, rather earlier in the same century, left orders that, when dead, he should be placed in a coffin perched up on end in a cellar. He had bequeathed all his

property to charitable uses, and had a notion that his relatives would try to defy the will unless his body were kept unburied; that is, not actually interred in the ground.

FROM DAWN TO SUNSET.

PART II.

CHAPTER THE FIFTH.

Two winters shed their snows, two summers spread their blooms round Enderby; and old Time, who gives and takes so much, turned his hour-glass, and the sands ran on. Beauty, hoar hairs, the feeble tired heart of age, the fresh and throbbing heart of youth, all bend to the death-sweep of his sickle. But his loans to the living are rich and rare; though he scathes and saddens, he seldom fails to beautify and bless. Each life, in early dawn, wins from the old graybeard's hands hope and love and joy in very showers; youth is so beautiful, youth is so hopeful, youth is so bright! Old Time gives more than he ever takes away, for he gives days replete with life and strength and gemmed with golden hours; but when he asks them back, they are shrunken and worthless, mere empty shells, from which man has extracted the sweetness and the goodness to his own vitality or destruction. Old Time is merciful; if he wounds with that keen scythe of his, he as often cures with healing balm. More often he spares from cruel hurts the aged and the young. The young spring joyously over his scythe, and he pelts them with flowers, and loves them for their daring and content; they fear him not. Strong manhood rushes at him, wrestles with him, strives to wrest from him more than he will ever give; so perchance he throws that strong man, or pitilessly severs a limb. But the aged he loves, because they are like to him; their bleeding wounds he numbs, their failing hands he takes within his own, and leads them gently on the way; then filling their poor hearts with blessed memories of youth and spring, draws his scythe around them, and lays them gently down to rest.

The Rose of Enderby was favoured by old Time, who called Dame Nature to him, and bade her paint her darling with colours rich and rare; to filch somewhat from the red beauty of the bud; to subdue it to a fainter softer hue; to darken the gold tints in the amber hair; to deepen the lustre in the laughing eyes; to whisper to the heart of the rose, so that the sweet voice of Nature might flutter that maiden heart, and raise the maiden blush, that fairest gem in maiden's dower.

Deborah Fleming was a very proud maiden. She heard those whispers; she felt those fairy knockings at her heart, but she barred the door against them. She had grown so beautiful in her flush of dawn and grace of womanhood, that if all eyes had not told her she was beautiful, she must still have known it; and a proud happy consciousness took possession of her and made her fairer. Yet these were dark days for Enderby. You might

not have thought it, to hear Deborah's songs and laughter, and to see the father and daughter together; but how often it is so—ruin is laid away like an ugly dream, not to be realised, not to be believed in, till the inevitable end. Then there was hope, hope that never dies out but with life, and Deborah threw hope round her two darlings; but she *did* suffer for them as much as her wild buoyant spirit and hopeful heart would let her. She did pray for them sometimes, not often. Deborah had well-nigh forgotten her mother's prayers, and learned no new ones. Heaven help her! But in those days Deborah's noble heart kept her true to God and man, so that she did not stray far away in her wild and wilful youth. She did strive to lead her darlings right, the old man and the young. She was their one link to good. Her woman's eloquence and woman's love had sometimes saved them. She knew their danger; she saw the dark cloud that gathered and ever deepened over Enderby. With her feeble hands she strove to avert it, and yet looked and laughed with undaunted brow, feeling the joy and gladness in her heart, that outshone all else, and broke out in uncontrollable sunshine over all. 'Oh, Charlie was young; he must sow his "wild oats" like other men.'—'Oh, that rich old uncle who had gone to America, and made fabulous wealth, and been no more heard of, would come home and die, and leave father all his fortune, to build up the fortunes of Enderby.'—'There were joyful days to come!'

Meantime Kingston Fleming was travelling abroad as a tutor, having carried off high honours from Granta. Deborah had not seen him for more than two years. Betrothed, folks said, to Beatrix Blancheflower, and they would marry soon. Charlie had left Granta, nor was he very often seen at Enderby. May's grandmother was dead, and May was an heiress, living in Italy with a stern old guardian, and sometimes dreaming of going again to Enderby, and sometimes writing a long, long letter to Deborah. 'Mistress Dinnage' lived at home, and kept her father's house, and dismissed all rustic lovers. Deborah now used the grand saloon at Enderby, long uninhabited. You approached it by the picture-gallery, which was lighted on one side at regular intervals by high windows; while on the opposite wall hung faded portraits of Flemings innumerable, knight and lady. The guests (what guests there were) were ushered along this gallery by grim old Marjory, and so into the presence of the beautiful Deborah Fleming; or if Deborah were not there, her spirit would seem to pervade the place. The roses blooming about in careless gay luxuriance; the curtains thrown back; the sun streaming in brightness through the great semicircular window, lighting up even the gloomy walls, and bringing out in curious distinctness the grotesque figures woven in the ancient tapestry; the work and flowers scattered about; the little white fluffs of kitlings disporting on the rug; the flowery perfumed

atmosphere—all breathed of Deborah Fleming and summer-time.

We don't know if the stately old guest whom Dame Marjory ushered in that morning was insensible to the charm or no. He walked to the window and sniffed at scent of the roses, looking, as he did so, blind and grim. He was an old man, but still a straight and stately one; his features were strongly marked, and intersected by deep lines of passion and craft; but he looked a thorough-bred old gentleman, so clean, so calm, so placid—and all evil passions seemed to be at rest. There was something even pathetic in the dim gray eyes and expression of gloomy weariness. He had not the appearance of a formidable foe, or of being full of cruel passions either, as he stood in the morning sun. It might be that the dark tales and rumours of old Adam Sinclair were all false; it might be envy, it might be jealousy, that made men talk thus of the wifeless and childless master of Lincoln Castle, who was the owner of lands so broad and brave. At all events he proved a friend in need to Sir Vincent Fleming, and therefore Sir Vincent gave no credit to those tales.

Now Adam Sinclair had thrice seen Deborah Fleming—once as a laughing mischievous child, grimacing at him unheeded from behind her father's chair. Again, riding with a gay cavalcade in the streets of Granta, when a young fop whispered Deborah, and she laughed (was it at him?); and he did not forget the girl on the black horse. Again he met her in the hall late one night at Enderby—he met her face to face, and Sir Vincent introduced him, under circumstances which we shall here relate.

Sir Vincent and his boon companions had been drinking deeply that night. From a far-away chamber Deborah heard the sounds of song and laughter and loud voices. She knew too that there was something more than drinking going on, that fortunes perhaps were being lost and won. She sat on and listened, looking stern and grave for her, and the great clock struck the hours two, three, four! Deborah had got it into her head that those men were all pitted against her father, and were laughing at his ruin. She walked restlessly to and fro; her cheeks began to fire and her wild eyes to flash. Suddenly her father, looking pale and unsteady, and leaning on the arm of a tall angular old man, entered the hall. Both started as if they saw a ghost; Sir Vincent grasped Adam Sinclair's arm, and so Deborah Fleming faced them in all her beauty.

'Child,' muttered Sir Vincent huskily, 'my old friend. Shake Master Sinclair by the hand. He's your father's good friend.'

Adam Sinclair smiled suavely, and bowed well-nigh to his knees; he was quite sober, and now beheld the superb figure he had seen on horseback at Granta, and a face of exquisite loveliness and disdain. But when he extended his long lean palm, Deborah put her right hand behind her back, laid the other on her father's arm, and knitted her dark brows at Sinclair with the glance of a tigress. So passed that formal introduction.

Merriment, disdain, angry passion—he remembered all, and still Deborah Fleming stood before him as she had stood on the night of his repulse. He *must* see her again and talk with

her. Twice he called in vain at Enderby, and still those falcon eyes pursued him. Day and night, he pictured some man, young and handsome, kneeling at Deborah Fleming's feet, and then he shook with the maddening thought. Then he bethought him of his own broad lands and his grand old castle, and he had hopes of he knew not what. But trembling, he rode again to Enderby. Sir Vincent was not at home; 'Mistress Fleming' was. Thus he stood, waiting for Mistress Fleming's step: he was not deaf, when it came; he counted each light reluctant footfall, and his heart beat violently, like a boy's. So the courtier and the country maiden met for the first time, alone. Master Sinclair apologised again, as he had done by Marjory, for the intrusion, but begged the favour of a few moments' interview with Mistress Fleming. Mistress Fleming bowed in proud silence, and a faint colour tinged her cheeks, at the thought of her former reception of this grave old man; she thought in her heart she had been rude and unmaidenly, perhaps unjust to him; still an unconquerable dislike and shrinking made her sit as far away from him as might be. He staid a long half hour, and he paid her delicate and courtly compliments; he shewed by his looks and conversation that he thought her not only a beautiful girl but a thoughtful intellectual woman. Deborah was half charmed against her own heart; and he found her so sweet and gentle, that the next day he rode over again, trembling with eagerness, wild hopes, and sore anxiety, and had asked to see Sir Vincent Fleming. Deborah was out. She returned from a ride in one of her mad fits of joy and animal spirits, and with loosened hair and flying step, entered the hall where Sir Vincent was alone. It was a fair spring evening; the old baronet was smoking his pipe, and striding thoughtfully to and fro, but somehow Deborah stopped on her way to his arms; she knew by his face that something unusual had happened.

'Come hither, Rose of Enderby,' said Sir Vincent, and threw down his pipe, and gathered his little daughter in his arms. 'Let me congratulate thee on thy first conquest.'

'What do you mean, father?' asked Deborah, blushing as red as any rose.

'Why, a fellow has been here this morning asking ye of me—asking ye in marriage—no less than Master Adam Sinclair, of Lincoln Castle!'

What a flood of colour rushed into Deborah's face, dyeing her very brow! She was startled, she was shamed, she was half proud, she was disdainful. 'Does that old man want to wed me, father?'

'Ay; that old man, the greatest man in the county.'

'In riches, father.'

'And in land: he has a goodly home. He has done your father good service, Deb. And he is charmed with Mistress Fleming.'

'Well, let him be charmed. I find no charms in him. Nay; shake not your head, good father. Not only do I find nought to charm me, but my heart rebels against the smooth-tongued old man who calls himself my father's friend. Father, I love him not. Not for twenty castles, would I be Master Sinclair's wife!'

'Wrong, wrong, Deb; too rash by half. Think it over, child; ask yourself if ye are not hot-headed, blind, and prejudiced; and if it were not better to wait and know Master Sinclair better, before

casting from ye the prize that has been for many years the vain desire of every maid and matron round. Wait, Deb, and let me have your sober answer to-morrow, or later still.'

Deborah grew very pale. 'Father,' she said, 'd'ye really, truly love and respect this Adam Sinclair in your heart? Is he so dear to you—and can ye trust him *so well*, that after a few hours' thought ye are ready and willing to give up your one daughter to him for *life*? For life, father—for *life*—and no love to bear me up.'

'He is an old man, Deb.'

'Yes; and he will die soon, you would say, and leave Lincoln Castle to me! But first, I would sell my soul, father, and drag on through days of unutterable horror, as Adam Sinclair's wife, before I could be released. And God might judge me, by taking me the first. O father, father! Say thou lovest me. Do not break my heart. Say thou hast some great and secret reason for liking this old man. Say thou'rt in a grievous strait, to need this help of me. Or only say, sweet father, that it wrings thine heart to ask me to part from thee. Anything, but that thou'rt willing to be rid of Deb! Ah me! Thou art cool, father—thou art indifferent, while my soul aches for sorrow at the very thought of parting from thee! Ah, but thou wilt have thy darling still—thy Charlie; while Deb, poor Deb would languish as Mistress Sinclair, with no more hope in life. I should have nought but memory, and memory would be like to drive me mad!'

Sir Vincent was fairly taken by storm, by Deborah's burst of fiery feeling; he grew pale as herself, he folded her to his breast; for indeed under his exterior coolness, he had been sore pressed, and feeling deeply; his heart had been loudly crying out on him, for this temptation to give away his young and only daughter to a man more than double her years, and such a man as Adam Sinclair. 'Deb, Deb,' he faltered, 'thou hast vanquished me! Love thee, child—love thee, little sweet blossom! Thy mother's living image, my hope, my *stay*! Nay; keep in my heart, and shelter here! It is all I have to offer thee. Don't unman me, love, by these tears. 'Twas sore temptation tempted me to give thee up—to have thee the greatest lady in the county, instead of nought but the daughter of a beggared and a ruined man.'

Deborah dashed aside her tears; all her heart spoke in her brave bright upward smile upon his breast: 'Nay, father, nay—not beggared, not ruined. These are strong words. And thy love is greater treasure to me than all the wealth of Master Sinclair. Put thine arms round me. There; I am as happy and hopeful as a queen; so thou wilt be happy too. And who knows but Deborah Fleming may do great things yet? Why, if Master Sinclair finds something in this poor Deborah Fleming to love, a greater and grander may. I am not so modest but that I know my worth either.'

'Ah, thou'lt make many a heart ache, Deb, before thy day is done. Meantime, be kind and friendly to Adam Sinclair, for my sake, if he will be friends. I tell ye he will not give up hope. I know Adam. Repulse him not, Deb; let him hope on; it will sun Adam's declining days.'

'I will give him no false hopes, father. Tell him from me that I can never be his wife; thus he may be looking elsewhere. Then if it pleases him

to come to Enderby for my friendship's sake, he can. But father, does he not *darken* Enderby ?

Sir Vincent frowned. 'How mean ye, child ?'

'Why, father, he professes too great love for you ; I doubt a little these mighty professions. My love makes my eyes like lynx's eyes, to see through all who work thee harm.'

'Then they have proved too keen. Adam Sinclair would cut off his right hand for me. I say not for love ; he comes not of a loving kind, and men o' the world deal not in such stuff one towards another ; but because in former years I saved him from a worse trouble than ever I have known. There ; it is *gratitude* that binds this man to me, and he has shewn it.'

'Ah ! Then I will thrust away this distrust that is not worthy of me. I never knew the heart that was not grateful for great service done. And what is more, I'll ne'er believe in ingratitude. Dear Adam Sinclair ! Good old man ! Grateful, grim, old, true friend of my father, I will strive to forget that you have ever wished to wed me ; so I may grow to like you as a friend.'

Sir Vincent laughed. 'And this is hard ! What dost like ? Whom dost like, Deb ? Of all the brave fellows thou seest in the hunting-field, whom couldst thou choose ?'

'Faith, father, I can see no "brave fellow" there but the poor gallant one streaming along in the bushy-tailed red-brown coat !'

'Sir Reynard ? Ha, ha ! Thou'rt thy father's true daughter. But not one beside Master Fox ?'

'Not one.'

'I am glad on't. They are all rattle-pates or penniless. I wish to give thee to better folk.'

'Hark to him ! Thou ambitious old dear ! Well-a-day, I am in no haste to wed. As Deborah Fleming, I am happy. Oh, that I might never change that name !'

'Pshaw ! Thou'lt not say this always ; but unless with thy full and free consent, Deborah Fleming thou shalt remain.'

'This is the gipsy prophecy,' said Deborah, as she went up the great oak stairs. 'The grand old man who would meet me at the gates of my own home.' Then in her own room, musing : 'But "love and greatness should come hand in hand." God forbid that I ever love ye, Adam Sinclair ! Unless some false witch should blind my eyes with "love in idleness" I never will. Oh, keep me from it, kind Providence ! If ever so deluded and deceived, I would wake up to misery ! If I saw father *starving*, would I ? No ; for in so doing, I would kill both my body and soul. I wonder, will King Fleming ever return ? I had well nigh forgot him. And he will be for wedding Mistress Blancheflower. Why she must be getting old. Ah, well-a-day, we all grow old.'

CHAPTER THE SIXTH.

It was about this time that a distant kinswoman of Deborah's died, leaving her a legacy of twenty guineas a year. It seemed a fortune to Mistress Fleming. With the twenty golden pieces in her hand, she sat revolving in her mind what she would buy with them, happy as the blue fly that buzzed about her sunny room, she who had so often looked on grim poverty face to face. Our heroine was full of joy. The bells of Enderby were ringing out their glad gay peals. The air

was radiant with sunshine, and heavy with fragrance. Kingston Fleming was coming home, and coming to Enderby. The murmur of the bees about the ivy, the scent of clambering roses and honeysuckle, brought back the days of childhood. There, were the great boughs in the wych-elm where they swung ; there, were the green woods where they played.

Deborah, with her arm leaning on the warm sill, was in a very dream of bliss, and then her wandering thoughts came back. Yes, half must be laid by in case of need, or as much as could possibly be spared ; she would say half. Then there must be a new cap for Marjory, a book for Mistress Dinnage—a tale of love and romance ; a hunting-knife for Jordan. And what for dear old Charlie ? She must think that over. It was difficult to know what could be nice enough for one so fastidious and so dear. And what for herself ? A new cap to match the lace she had ; for she was no longer a hoyden with tangled locks, but 'Mistress Fleming.' She would ride into Granta the next day, and buy that little cap. Drawing the curtain which shut out the alcove, the maiden threw her money on the bed, and there too was laid a soft and sheeny dress, trimmed with costly cobweb lace, a dress of her grandmother's modernised artfully by herself and Mistress Dinnage. Deborah's heart beat and her colour rose. Girls are silly beings. She could think of and pine for nought but that coquettish cap which would jauntily set her love-locks.

While thus musing, the door opened abruptly, and in stalked a travel-stained figure, a tall figure, with wild dishevelled hair. It was Charlie Fleming, with the passions of his boyhood darkened and deepened, in the sombre beauty of the face that had grown stern and set. He was pale through his bronze ; his long hair streamed back from his heated brow, and his whole air betokened a reckless fugitive spirit. Deborah had not seen him for weeks ; she gave a cry of joy, and sprang into his arms. The roughness of the boy had passed from Charlie Fleming, but his rare demonstrations of affection were shewn to Deborah only. 'I am only here for half an hour, Deb. I must saddle horse afresh and off to Lincoln Castle. I am in rare trouble, Deb. Hush, child ! I am come to thank ye for refusing Adam Sinclair. Better poverty, Deb, than that. Better starvation. I'd blow his brains out sooner than see you his wife. See that ye are never talked into this. I know your generous madness, child ; let *no misery* move ye to it.'

'Nay, Charlie ; it never shall ! But if you are so averse to him, do not go to Lincoln. I hate him. I distrust him more and more. You are pale and tired too, Charlie. Is it the *old* trouble ?' Deborah leaned forward, where she sat opposite him ; the sweet confidante of father and brother was wont to forget all her own joys and sorrows in theirs.

Charlie raised his dark beautiful eyes to hers, then dropped them ; the furtive glance was enough. Deborah thought of her gold, and her heart began to throb with tumultuous joy. 'Is it *much*, Charlie ? More than—twenty guineas ?'

Charlie laughed a bitter laugh. 'Don't ask me, child,' he said ; 'you cannot help me, Deb. I am undone !'

'Not so undone but that I can help you a little,' whispered Deborah softly, and ran towards the

bed. Then she drew Charlie's hands down from his moody face, and with her own all radiant, laid her treasure in his hands. 'See, Charlie! This is *mine*, my very own. I have never had such riches before. Just before you came in, dear boy, I was racking my brains as to what I could buy you with these guineas, and now I give them all to you in place of presents. Don't thank me; it is thanks enough to let me stand thy friend. For what need have I for money? To me it would be worthless!'

'Who gave ye this, Deb?'

'A fairy—a true fairy, who knew your need.'

'Not May Warriston?'

'May Warriston? No! What ails you?'

'Deb, I cannot rob thee, dear. Thou needst a thousand little gewgaws such as women love. Say no more o' this;' and Charlie gave her back the gold.

But Deborah was on her knees, putting her soft face up to his. 'Charlie, it will break my heart if you disdain my poor gift. I tell you again, I have no need for money—only as a temptation for finery and trinkets which it would be sin for me to wear. Old Charlie, sweet old Charlie, I *will* be mistress here!' And Deborah poured her gold into his pocket and closed it up. 'You will not go to Lincoln now?'

Charlie Fleming took her face between his hands; a melancholy smile fluttered about his lips; and she, so radiantly happy: 'Will you go?' she urged. 'Yes.'

'Oh, wilful, headstrong, obstinate! To this one time I give consent; but after this, you shall go no more to Lincoln, to be the companion of that bad old treacherous man. He would fain ruin us all; I know it!'

'Tush, tush! Deb. I know just how to take Adam Sinclair. And if he wrongs mine by word or deed, let him look to it!' And the young giant rose to his feet.

Deborah caught his arm. 'You are not going to fight him?'

'Fight him? No; we are friends, bosom friends, like as thyself to Mistress Dinnage.'

'Well, be not rash and hot-headed. I know your fiery temper, and am ever in fear and trembling, with such a man as Master Sinclair too, that you should quarrel and hurt him sorely. Quarrel not about *me*, Charlie; he is always courteous to me.'

'I hope so. Good-bye, sweet Deb, good-bye.' The brother and sister kissed, and Charlie sped to the court-yard.

Old Jordan held Bayard for him, ready saddled. 'Thanks, good Jordan. Where is my father?'

'I ain't seen him these three days, Master Charlie. An' now thou'rt goin' away agen, these be dull days for Enderby an' Mistress Deborah.'

'Where's Mistress Dinnage?' asked Charlie, dropping his keen glance to the old man's face.

'In the manor here; she well-nigh lives with Mistress Deborah, an' well she may.'

'I never see her about.'

'She's there though, Master Charlie.'

'Good-bye, Jordan. Take care of them.' And Charlie Fleming, striking spurs to his horse, rode away; not so fast but that one pair of dark eyes, full of proud reluctant tears and lingering passion, looked from a window overhead, and watched him as he sped away.

'Poor little Deb!' muttered Charlie, as his good horse bore him far away. 'I will not forget thee, dear. Poor little maid! It has eased her heart. A drop, a drop in the ocean of my troubles, is Deb's gold to me. Poor child! Now, if you fail, Adam Sinclair, flight is my only chance.'

HOTEL HOSPITALS.

SOME years ago, a Birmingham medical man—Mr West—in a very ably written contrast between English and French surgery, drew attention to a kind of hospital common abroad, and much appreciated there by the class for whose benefit these institutions are intended, but of which in Britain we have no examples, or at most one or two experimental wards on a very limited scale. These institutions are hospitals where patients of the middle class who can afford and are willing to pay a moderate sum, can be received when serious illness or accident unfortunately necessitates medical aid—'a special kind of hospital,' said Mr West, 'unknown in England, which I think of great utility, and of which there is, I believe, an urgent need, not only in London, but also in every large town throughout the provinces.'

Mr West's paper does not appear to have borne much fruit at the time; but recently the question has appeared again, and this time, so much has been done to give prominence to the movement, that a public meeting was held last June at the Mansion House, to discuss points in connection with this great subject. There cannot be two opinions as to the general advisability of establishing such hospitals in this country, and as was to be expected from the honourable desire of the medical faculty always to do what appears best for suffering humanity, we find that the scheme has the cordial approval of the presidents of the great medical bodies and the chief members of the profession in London, who agree that this is a much-needed institution.

Out of England, there are various examples of such hospitals, such as the State Hospital at Christiania, which is entirely supported by such paying patients; the famous *Maison Municipale de Santé* in Paris; and various institutions in Germany and the United States, where for a moderate fixed payment, men or women of limited means, or who have no home in a large city, can obtain adequate care and proper nursing in case of illness. The great French hospital, the *Maison Municipale de Santé*, is a model of what such an establishment should be. It is under the control of the municipal authorities, and has nearly six hundred beds ready for the treatment of sick and wounded persons of the class now alluded to, who, for a daily payment varying from four to twelve francs, can obtain medical and surgical advice—medicine, food, baths, and all else necessary for their proper alleviation or cure. There are two physicians and a surgeon on the staff of the hospital; but if the patients choose, they can call in consultation any of the Parisian hospital doctors, and the fees paid to them are the only extra expense that inmates are liable for. 'The hospital,' says Mr West, 'is clean, well-furnished, comfortable, and contains every variety of bath that the patients can possibly require.'

What a boon such an establishment would be, not only for the large numbers of clerks and

assistants in our shops and warehouses, who live in lodgings, and are far from the tender hands of a loving nurse, but also for a class who are anxious to have the advantages of a well-managed hospital and its careful nursing, rather than subject near and dear ones at home to all the trouble and anxiety of nursing and watching, besides the great risk of infection. There is certainly a strong and no doubt very natural feeling against the idea of being away from home when sickness overtakes us; but in process of time this dislike must yield to the undoubted fact, that in a well-organised hospital, a case has, as a rule, a far better chance than elsewhere of being thoroughly attended to according to the directions of the physician. The loving hands that smooth the pillow under the uneasy head need not be absent here; but it must be remembered that it is not given to every mother or wife to be a good nurse. Nervousness and inexperience, over-anxiety from the very great interest in the issues of life and death for the loved one, are often causes of risk to the patient. Then, too, house accommodation may be limited: perfect isolation of the infected patient, especially in the 'flats' of such a town as Edinburgh, may be well-nigh impossible; while the disease may be, like small-pox, of a kind that drives all but the most self-sacrificing of friends away.

In one of the many letters written on this subject we get a pitiable instance of such a case as this: A young man, living with a lady and her daughters, became ill with small-pox. His mother was dead, his father in India. When it was clear what disease he had, every one left him but one servant. His doctor sent him to a small-pox hospital, but it was full; and he had to be brought back again, and put under the care of a nurse from an Institution; but at ten p.m. this Mrs Gamp was found to be quite drunk, and another had to be sent for. But how infinitely better would it have been if he could have been sent to a paying hospital. The present writer knew of a case some years ago that peculiarly illustrates the value of such institutions. A young married man of limited but not straitened means was seized with illness at home about a week before the 'flitting term,' at which time he was to remove his household goods to another town. The doctor pronounced it fever, and said that if he was to be removed at all, it must be immediately. It was absolutely necessary he should leave his house when his tenancy expired; and as they had no friends in town to whom to go, no course was open but to send the sick man to the public hospital; which was done. Here was a distinct perversion of the objects of such an institution; and though in this case some compensation was made in the form of a donation, yet here again, how much better for all parties if that hospital had had a wing, where he could have been taken in on the distinct footing of payment for its advantages.

Various proposals have been made as to the mode of instituting such hospitals. Sir Rutherford Alcock is in favour of a certain number of wards in good existing hospitals being set aside for the accommodation of paying patients at varying rates, to suit their varying means; others advocate the building of distinct wings or pavilions to existing hospitals; while many think that buildings separate in every way should be specially built. The

advantages in favour of connection are that in these hospitals there is already an organised staff of physicians, surgeons, and nurses; and that while the extra expense of an expansion of this staff would be comparatively small, the payments from the new class of patients would largely help the funds of the hospital in its charitable purposes. It is probable, however, that a distinct institution—an 'Hotel Hospital' it is proposed to call it—will soon be set on foot, as a limited liability company is spoken of for the purpose.

The London *Figaro* some time ago advocated the establishment of dispensaries where a man of the middle class could get for a small fee first-rate medical advice. In this material respect the workman is decidedly better off than the struggling member of the middle class, who, if he has to consult a leading physician, must pay fees beyond what he too often can afford, while to the poor man the highest medical advice in the kingdom is as free as the air he breathes. The *Figaro* shews how this would be not only a great advantage to middle class people but to the medical profession, in which at present many young men have to be content with a local practice, because they have no opportunity for obtaining hospital practice, which is so necessary for qualification as a general physician.

DIAMOND CUT DIAMOND.

A GRANDFATHER'S STORY.

ABOUT sixty years ago I was in Paris for the first time in my life. Bonaparte still lingered at St Helena; and the adventurers, good, bad, and indifferent in character, who had served in his armies had not yet lost all hope of the return of their idol, and consequently had not yet thought it worth while to settle down into thorough peace and quietness.

Young Paul Ferrand, whom I frequently met at the café, and who had served as a captain at Waterloo, was sure that the Little Corporal would come back again soon. 'You have not yet beaten him,' he would tell me laughing. 'You sent him to Elba, but he returned; you have sent him to St Helena, and he will return again. We shall see.'

Ferrand was an exceedingly nice fellow; and although he professed to cherish an unquenchable hatred for England and everything English, he had, by some means or other, become attached to Alice Rac, a young English lady of my acquaintance, and who had been living with her mother since the conclusion of peace at Paris, not far from the abode of the ex-captain. And he was always very friendly with me too. He would, it is true, abuse my countrymen most unmercifully; but he was always particularly good-natured; and whenever he found himself saying a little too much, he would arrest himself and apologise so heartily, that I never could be angry with him. I was alone in the French capital, and had few friends there except Mrs Rac, her daughter Alice, and Paul; and so it happened that I passed a good deal of my time in the society of these three. The mother, a woman still in the prime of life, and the widow of a king's messenger, was a connection of mine by marriage, and that fact gave me a good excuse for offering my services as escort whenever she and her pretty daughter thought fit

to go to the theatre or the opera. At such times Paul always had a seat in the stalls; and between the acts he would come up to my box, to the delight of Alice, who was in love with him, and to the no small satisfaction of Mrs Rae, who herself had quite a maternal affection for the young Frenchman, and did not in the least discourage his attentions to her daughter. If there were no formal engagement between the two, it was at least perfectly understood by all parties that as soon as Paul should get an appointment, for which at the time he was a candidate, he was to marry Alice; and I, though only a few years her senior, was to give her away.

One night the opera-house was crowded more than usual. A great singer was to appear, and a new work by a renowned composer was to be performed. But Paul Ferrand, sitting in the stalls, seemed scarcely to listen to the music or to notice the acting; and much more often were his eyes turned in the direction of my box than in that of the stage. Alice and her mother were with me; and as the curtain fell at the conclusion of the first act, Paul came up to us. He was in high spirits, for he had heard that the minister had decided to give him the coveted post, and he expected to hear in a few days that his appointment had been signed by the king. We congratulated him; and as he left us to return to his seat, I whispered to him: 'You'll be a happy man in a month or two now, Paul.' He smiled, and shut the door.

We watched him as he threaded his way to his place. It was in the centre of the second row from the orchestra, and he had left his opera-glasses on the chair, in order to preserve his right to it; but during his absence a tall, military-looking man had appropriated it, and had coolly put the glasses on one side. Paul approached the stranger with the utmost politeness, and I suppose, for naturally I could not hear, requested him to move. The interloper did not deign to answer, but sneeringly looked up at Ferrand, as though to ask him what he meant by his intrusion. Paul pointed to the opera-glasses; but the stranger neither replied nor moved, but continued to appear as though he did not hear. I saw that matters were assuming a dangerous complexion, for in the new-comer I recognised Victor Laroquière, an ex-Bonapartist officer like Paul, a notorious bully, and one of the most celebrated duellists in France. But what could I do? I could only sit still, much against my will, and witness the inevitable consequences. I thought Alice would faint when Laroquière in the calmest way rose before the crowded assemblage and struck Paul in the face with his glove; but she recovered herself, and like a statue watched her lover pick up his opera-glasses, bow to his insulter, and without a word, leave the building. There were some exclamations from the audience; but the duellist again rose, and with a theatrical air gazed round, mockingly imitated Paul's parting bow, and resumed his seat. This was too much for poor Alice. She could not remain any longer; she must go home; and so, with some difficulty, I got her and her mother to my carriage, told the coachman to drive them home, and myself walked quickly to Paul's lodgings.

He had arrived before me, and was already writing when I entered his room. 'Of course,' he said, as he saw me and came towards me with

both hands outstretched, 'you, my dear friend, will assist me. It is impossible to do anything but fight. Even Alice could not make me alter my conviction upon that point, the insult was so public.'

'Suppose you leave the country?' I suggested.

'Then I should have to give up the appointment and Alice too. No, my dear fellow, I am a Frenchman, and I must fight; and you must arrange matters for me. If he shoots me, it cannot be helped; if I shoot him, I shall have shot the biggest scoundrel in Paris. I beg you to call upon Laroquière to-night. I have already discovered his address. Here it is.'

'But must you really fight? It is suicide to fight with a professional duellist.'

'Ah,' he said, shaking his head, 'I am afraid it is suicide; but I *must* fight; so please don't try and persuade me that I need not. And I will fight, too, as soon as possible. You can arrange everything for to-morrow morning. I must have the matter over. In a day or two I might be a coward.'

By his looks he implored me to go to Laroquière; and constituted as French society was at that time, I had no other course open to me than to do as he wished.

'If Monsieur come from M. Paul Ferrand,' said a man-servant when I inquired whether I could see his master, 'M. Laroquière has sent to say that he has not yet left the opera. He has, however, sent this pencilled note, which I am to give to the gentleman who comes from M. Ferrand.'

I tore open the missive. It contained two cards, one bearing the name of the duellist, and the second that of M. Fernand Delaraie, Rue Vivienne 18. Certainly it was an off-hand way of acquainting me with the name and whereabouts of Laroquière's second; but as I wished to pick no quarrel, I walked on to the Rue Vivienne, and in a few minutes was ushered into the presence of M. Delaraie himself. This worthy was a young man, aged about three-and twenty, and dressed in the very extreme of fashion. His ruffles were immaculate, and most symmetrically arranged; his lace handkerchief was steeped in essences; his gloves, which lay on the table—for he had only just returned, at Laroquière's request, from the opera—were small and delicate; his fingers were covered with valuable rings; and the bunch of gold seals depending from his fob was unusually heavy and brilliant. He did not strike me as appearing particularly warlike; but nevertheless, after formally saluting me, he at once touched upon the object of my visit; and before I had been ten minutes in his company, had arranged to meet Ferrand and myself at a certain spot, dear to duellists of the time, at an early hour next morning, and to bring Laroquière with him.

'I don't think we shall need a surgeon,' he said to me quite affably at parting; 'but if you please, you can bring one. In his last affair my principal shot his man through the temples, and he died immediately. I sincerely hope, Monsieur, that your friend is as clever.'

'Confound the fellow!' I said to myself as I left the house and sought the residence of my own medical man. 'I am afraid poor Ferrand is not such a consummate murderer as Laroquière.'

After seeing the surgeon, to whom I briefly explained matters, I called upon Mrs Rae. She

was doing her best to comfort her daughter, who was in the greatest possible distress. 'Are they going to fight?' she asked me.

'My dear Alice,' I said, 'they are. I have done my best to dissuade Paul; but he says, and I am obliged to agree, that he must fight. Let us hope for the best. He has a sure eye and a steady hand, and he has right on his side. The other man is a scoundrel. And you must remember that poor Paul is not an Englishman. If I were he, I would not fight; but as it is, the matter cannot be overlooked, and indeed everything is arranged.'

'You are to be with him?' said Mrs Rae, looking as white as a sheet.

'Yes; they are to meet to-morrow morning, and by breakfast-time Alice's suspense will be over. She must bear up.'

'You must prevent the duel,' sobbed the half-heart-broken girl. 'Cannot Paul let the insult pass? But no; it was so public.'

'You can only hope,' I said. 'I will see you in the morning; but now I must go back to him, and see that he gets some sleep.'

'Tell him,' cried Alice, 'that if he is killed I shall die. Come here directly it is over. Come, even if he falls: you must tell me about it. I must hear everything.' She buried her face in her hands; and I, escaping from the unhappy girl, hurried to Paul.

He was still writing, and his hair was in disorder, and his face pale when he turned towards me. 'I am no coward,' he said, 'but I am saying good-bye to her, for I shall die to-morrow.'

'My dear fellow,' I exclaimed, 'you will shoot Laroquière, and be married next month. You must finish your writing at once and go to bed. I will sleep here to-night, for I must see that you turn out in time to-morrow morning; so be as quick as possible.'

He wrote for another half-hour, addressed the document to Alice Rae, placed a lock of his hair within it, and after sealing it up, gave it to me.

'Give that to her,' he said, 'if Laroquière kills me outright—and I know he will. If it were not for Alice, I declare that I should be quite glad to meet him. Now for bed.'

He undressed; whilst I lay down on the sofa in the next room and lit a cigar, for I could not afford to sleep myself. Soon all was quiet, and I stole in to see Paul lying as quiet as a child with a smile on his face. Probably, nay assuredly, I passed a more uncomfortable night than he did. Only with the greatest possible difficulty could I keep awake; and the hours seemed to linger for ever. At last, however, daylight dawned, and I called Ferrand, who woke refreshed and in comparatively good spirits. After a hurried breakfast we muffled ourselves up; I placed a flask of brandy, some powder and bullets, and a brace of pistols in my pockets, and we sallied forth in the cold morning air. Scarcely any one was abroad, except a few sleepy watchmen, who seemed to make very shrewd guesses at the object of our expedition; and through the silent streets we went for a mile or so, until we reached the meeting-place.

Laroquière and Delaraie were there before us, and my friend the surgeon arrived immediately afterwards in his carriage, which waited near at hand. The pistols were produced and loaded. Laroquière chose one, and I gave the other to Paul; and then the two men took up positions at

a distance of twenty paces from each other, and waited for Delaraie to give the signal to fire.

'Stay!' cried the bully, as his second stepped back; 'let the young hound listen to this. I am not trifling with him: I shall shoot him only where he wishes, for I am generous, parbleu!'

'If I do not kill you,' said Paul quietly, 'I prefer to die.'

'Then I shoot him through the heart,' coolly observed Laroquière. 'It will teach others not to challenge me.'

There was something to me unspeakably horrible in the way in which these last words were pronounced. I shuddered, and looked at Paul. He smiled at me, and at the same instant Delaraie gave the signal.

There was but one report, for Ferrand's pistol flashed in the pan. The poor fellow turned round towards me with fixed eye and pale face, and with the name of Alice on his lips, fell dead. Laroquière turned on his heel, and departed quickly in company with Delaraie, while I aided the surgeon in his brief examination of Paul's body. Surely enough, the bullet had passed through his heart. He must have died almost instantaneously, for he did not move after he fell, and the last smile with which he had looked at me was still upon his face. It was a melancholy business in every respect. I had to break the sad news to Alice and her mother; and the two ladies were so terribly overcome, that I feared the shock would have some permanent effect upon their health. For my part, I was obliged to hurry to England as soon as possible; and Laroquière, I heard, also got away, and remained out of France until the affair had blown over.

I kept up a correspondence with Mrs Rae, and was glad after a time to hear from her that Alice, though still terribly upset, had learned to look with a certain amount of philosophy upon her misfortune, and had to some extent recovered her usual health, if not her usual spirits. Meantime I settled down in London, and unable to forget my Parisian habits, usually dined at one of the then much frequented taverns in Fleet Street. The *Cheshire Cheese*, which was then in much the same state as it is now, was my favourite haunt; and there, as months passed by, I gradually picked up a few pleasant acquaintances, chief amongst whom was an extremely well-mannered young gentleman named Barton, a man of independent means, good family, and first-rate education.

One day, after he had been dining with me, the conversation turned upon continental manners and particularly upon duelling. As an illustration of my abhorrence of the system, I told my companion about poor Paul's death, a matter in which Barton appeared much interested. He asked me a good many questions about the parties concerned, and after expressing a remarkably strong opinion to the effect that Laroquière was a blackguard, bid me good-night. I went home to my rooms in the Temple; and next day, on visiting the *Cheshire Cheese*, found no Barton. He had left word with one of the waiters that urgent business had called him away, but that he hoped to see me on his return. Weeks passed, and then months, and still Barton did not come back; and I confess that I had begun to forget him altogether, when one evening he dropped into dinner as though he had not been absent for more than a day or two.

'Where have you been?' I asked, after I had heartily shaken hands with him.

'I have been to Paris,' he said. 'On arriving there I found out a little more than you told me about Laroquière, and when I had thoroughly convinced myself that he was the blackguard you painted him, I arranged for a series of lessons at a pistol-gallery. Every day for a month I went and shot for an hour or two, until I was so perfect as to be able to hit a small coin every time at a distance of twenty paces. After satisfying myself as to my proficiency, I took a box at the opera; it may have been the same box that you used to have. Laroquière was pointed out to me. He sat in the stalls, and between the acts he left his seat in order to speak to a lady in another part of the house. I descended as quickly as possible and took his place. He returned, and asked me in an overbearing tone to move. I refused. He persisted. I struck him. He sent me a challenge, and we met upon the same spot, curiously enough, where he had killed your friend Ferrand. Before the signal was given, I said: "M. Laroquière, listen to me. I am not here to trifle with you: but I am as generous as you were with Paul Ferrand. I will shoot you only where you wish." He turned deadly pale. "We will see," he said, "whether I shall not make you a second Ferrand!" "Then I will shoot you," I returned, "as you shot him—through the heart. It will teach other bullies not to challenge me." Whether he was so upset as to be incapable of aiming or not, I cannot say; but my dear fellow, I shot him as dead as a dog, right through the heart, and avenged your friend, at the same time ridding Paris of its biggest villain. It was a case of diamond cut diamond.'

'Well done, Barton!' I exclaimed.

'Wait,' he said, 'and let me finish the drama. We managed to keep the matter very quiet; and before leaving France, I was able to call on Mrs Raa, who is now at Boulogne, for I had a letter of introduction to her from a Parisian acquaintance. When I saw her first, she knew nothing of the affair, but at last I broke the intelligence to her and to her daughter. I found Alice to be a pretty girl, somewhat spoilt by her long mourning, and not very much inclined to listen to me; but my dear fellow, after three weeks of hard persuasion she gave in, and now she and her mother are coming over next week. I believe you were to give Alice away. When she arrives, you shall have a capital opportunity.'

'And,' I added, shaking my friend's hand warmly, 'I shall be delighted to do so.'

MODERN SUPERSTITIONS.

Most people accept it as a fact that superstition went out with the advent of steam, the telegraph, and the penny-post. A little honest observation, however, will assure us that there still exist a number of pitiable though petty superstitions. Among certain classes there are lucky and unlucky days in their calendar. They will not attempt an important task on Friday. The horse-shoe still hangs behind or over the door in the Highlands, and in some places much less removed from the centres of civilisation. East-coast fishermen will yet occasionally burn or otherwise

destroy a boat from which the lives of any of the crew have been lost, no matter how seaworthy or valuable the boat may be. A hare crossing the path of one of these hardy sons of the sea will cause him to forego an intended journey or voyage. To rustic and fisherman alike a concourse of magpies is an evil omen. As for dreams, the belief that they are the forecasts of events is perhaps the strongest of all the forms of their superstition. We might multiply examples, but have said enough to suggest that the follies of their great-grandfathers have still no slight fascination for the ignorant, in spite of the strides which intelligence has made.

But have superstitious beliefs quite left the more intelligent ranks of society? On the very subject of dreams itself is there not a sneaking credulity which goes far to prove the contrary? True, any one of us is quite able to account in a natural way for the character of his or her dreams. Nevertheless, the lady who chides her children for repeating the interpretation which the housemaid has put upon their sleeping vagaries, and sagely instructs them on the subject of imperfect digestion and its effects upon the brain during sleep, is not ashamed to impart to her husband any morning the particulars of her own shocking dreams, or to piously express the hope that something untoward is not about to happen. Her better-half pooh-poohs the matter doubtless, as becomes his superior dignity, but is visited none the less with a vague sense of uneasiness when he remembers that he himself had a vision of losing a tooth or seeing a house on fire. Having courageously quizzed his wife at the breakfast-table on the folly of her augury, and bade her and the children good-bye for the day, he inwardly deplores the unlucky omen of having to turn back for his forgotten umbrella or pocket-book!

How many curious but innocent little customs too are still current, and with the sanction of the wisest. An old slipper is still cast after a bride: it is considered necessary to christen a new ship with a bottle of wine: a fine day is still royal weather; and so on. These and many others most of us would indeed be sorry to see extinct. They are not only harmless, but in their very departure from strait-laced common-sense, give an agreeable and perhaps even healthful relief to the prosiness of ordinary life. To sacrifice them to the strict letter of reason, would be to sacrifice much of the sentiment of life, to banish imagery from poetry, to take the perfume from the rose, to guide into a Dutch canal the current of human affections, which left free will gush and eddy, prattle and murmur by rock and meadow, carrying music and health throughout its living course.

Would that modern superstitions never took less innocent shapes! Having discarded the ghostology of olden times, many people, and among these some men and women of considerable culture, have set up for themselves a novel system of intercourse with the unknown world. Brownies and fairies, with all the fine romance that surrounds the history of their doings among human folks, are dismissed with contempt. Spiritualism has swept all these ethereal puppets off the boards of ordinary life. To substitute what? We might at least look for an improved exhibition and more interesting

'characters;' but the truth is that nothing could be less satisfactory than the modern attempt at demon-craft. There is something so clumsy and inert in the whole get-up of the 'spiritual' drama, that it is less surprising to find it very generally scouted than to see it obtain even a partial notoriety.

Ignorance is the parent of superstition, without a doubt; and the one never exists apart from the other. There is, however, a second wise saw that tells a great deal of the truth about the origin of that world-old bugbear of the human mind, namely, 'The wish is father to the thought.' What we strongly desire to be, we are next door to believing to be. The appetite of man's vanity is unappeasable, and in catering for it his fancy plays tricks with his reason. He longs for intercommunion with the unknown, and indulges the wish by creating fictitious agents for that purpose. Tokens, signs, omens, and auguries are also outgrowths of the various forms of desire and vanity. We believe we shall have luck if we turn the money in our pocket when looking at new moon. Men have waited in all ages for the appearance of some favourable sign before beginning any enterprise of importance. If the sun shines on our wedding-day, how auspicious! Palpably in each case because we desire these things to be! But having set up omens with such an object, we, in the cleft-stick of our own superstition, are bound to believe their absence or converse, the foreshadowers of evil.

In many ways modern credulity frees itself from such mechanical trammels as those we have mentioned, to take a form and complexion from the age, losing meanwhile not one jot of its vigour. To dream three times of a hidden treasure and set about, Whang-the-Miller-like, to lay bare the foundations of one's house, is an exploit not to be thought of by the veriest wiseacre of our day; but the desire to obtain wealth easily and rapidly being, if anything, more active and rampant, the belief in some magical means for attaining it is the most natural thing in the world. An Eldorado is required, and lo! an Eldorado is implicitly thought to exist. The projectors of a bogus company for 'utilising the clippings of old moons' or 'extracting starch from granite chips' are the good fairies whom by propitiating with a portion of our substance we hope to enlist in our behalf, and obtain a thousand-fold return. Where such a superstition exists, and it is broadcast, any scheme however absurd, any swindle no matter how transparent, will serve for a bait to catch the unwary and over-eager fish. Nothing is so purblind as undue acquisitiveness. The ancient Highlander with his keen eye to the main chance and happy facility for 'attaching' whatever came in his way, found a beautiful horse in rich trappings, browsing ownerless in his path, and following the instinct of his desire rather than the prudence which tradition should have taught him, rashly mounted. In an instant he was borne aloft, then plunged for ever beneath the dark waters of a tarn on the back of the wily and terrible water-kelpie. We too have our illusory steeds in this so vaunted age, and neither the teachings of history nor the bitterest experience seems able to prevent the speculator from vaulting into the saddle, and forthwith launching into perdition.

Charms are things of the past, or believed in

merely by the vulgar; that is to say, those pretty and fanciful conceits which led our ancestors to attach a healing or sanitary virtue to certain objects and ceremonies are now almost extinct. A spray from the rowan-tree is no longer a safeguard against an epidemic, nor the hand of majesty a cure for scrofula. Ladies do not now believe that the presence of a piece of cold iron on their couch, *'while uneasy in their circumstances,'* will secure a happy consummation; nor is a child's caul in much request in these days as a protection against fire and drowning. True, we have got over these beliefs pretty thoroughly. But is the desire for infallible remedies and potent protectives done away with also? Not in the least; and though science is doing its best to provide honest substitutes in a natural measure, the public is not satisfied with its efforts. Quacks are the modern magicians, and quack medicines the charms of latter days. Those who are bald, for instance, will not accept their fate while a single well-puffed elixir with a Greek name remains untried. There is something saddening if not sickening in the evident success which attends the pretences to cure chronic and irremediable diseases, to effect miracles in short with the most trumpery of means and execrably silly devices. Our forefathers were imposed upon no doubt, but there was method in their madness. The 'simples' with which spac-wives and charlatans professed to cure ailments were in many cases effective and now recognised drugs, and were at the worst perfectly harmless; while the rites with which they were administered, if quite apart from the purpose, yet appealed gracefully to the imagination. Nowadays, however, the 'simples' are the patients and not the medicines! The old story. Child-like, the age cries for something that it cannot get, rejecting the good that is within reach.

In a recent number of this *Journal* we had occasion to refer to the amazing credulity of Americans on the subject of professional 'mediums.' The worst of it is that the extent to which this has been laid bare is insignificant compared with that which really remains unexposed. The desire to work with supernatural tools in effecting the paltriest and meanest of human ends would seem to have divided a people of accredited shrewdness into the two classes of rogues and dupes. But as we have seen, we too have been singed at the same fire. There are, moreover, other, if minor superstitions in our midst that suggest the propriety of beginning the task of reformation at home. An occasional glance, for instance, at the stock advertisements of leading journals will convince any one how widespread is the infatuation that believes in spurious offers of advantageous employment. Some of these have, under our own observation, been repeated with little variation for more than twenty years; and we have no doubt that the wily advertisers are able to calculate to a fraction the number and gullibility of their dupes. We have from time to time drawn attention to swindles of this class, as well as to those tempting offers of 'Money to Lend,' which appear with equal regularity in newspaper columns. We are afraid, however, that friendly warning and experience are alike unavailing to stem the mischief. The spread of education itself would appear unable to outstrip the spread of

imposture or the eager credulity that supports it ; for superstition merely shifts its ground from time to time, without losing appreciably its original dominion over the human mind.

ODD MISTAKES AND MISCONCEPTIONS.

At the last Christmas race-meeting at Ellerslie, New Zealand, just as the course was being cleared for the event of the day, uproarious sounds of merriment arose behind the saddling paddock, and a number of sailors belonging to Her Majesty's ship *Sapphire* were seen scurrying along, a stalwart blue-jacket in their midst bearing in his brawny arms the form of a woman. No screams resounded above the din created by the abductors ; but nothing doubting that the capture was an unwilling one, a gallant newspaper editor and a detective, eager to aid beauty in distress, started in hot pursuit, and after a smart chase across country, overtook the miscreants. To the officer's stern demand for the instant release of their fair prisoner, the tars replied by dropping their prize, whereupon the brave rescuers, rushing forward, tenderly raised the prostrate figure. Judge, however, of their feelings of mortification upon being told by the sailors that having at the interesting game of Aunt Sally, fairly demolished the old lady's pipe, and the accustomed sumpence for the adroit achievement not being forthcoming, they had carried off the old lady in reprisal !

For a dressed-up doll to be taken for a lady seems as improbable as that a lawyer should be taken for a thief, but even that has happened—so liable are men to be led away by appearances. Daniel Webster travelling by the night-stage from Baltimore to Washington with no companion save the driver, contemplated that worthy's forbidding features with a very uneasy mind. He had nearly reasoned his suspicious fear away, when they came to the dark woods between Bladensburg and Washington, and Webster felt his courage oozing out of his finger-ends as he thought what a fitting place it was for murder. Suddenly the driver turned towards him and gruffly demanded his name. It was given. Then he wanted to know where he was going.

'To Washington ; I am a senator,' said Daniel, expecting his worst thoughts were near realisation.

The driver grasped him by the hand, saying : 'How glad I am, mister, to hear that. I've been properly scared for the last hour ; for when I looked at you, I felt sure you were a highway-man.'

Upon another occasion a young gentleman accosted a stately looking personage at a Washington wedding reception with : 'Good-evening ; I'm delighted to see you ; we have not met since we parted in Mexico.'

Ignoring the outstretched hand, the gentleman addressed said : 'I fear you have the advantage of me.'

'Why, is it possible you don't recollect me ?' exclaimed the mortified young fellow. 'Certainly I was much younger when I was in Mexico with my father.'

'To tell the truth,' said the other, 'my remembrances of ever being in Mexico are very indistinct.'

'Are you not Sir Edward Thornton ?' inquired the puzzled one, beginning to suspect there was

a mistake somewhere ; a suspicion becoming a certainty when the reply came : 'By no means ; I am Judge Poland, of Vermont.'

A few nights after this rebuff, the youth happened to be at another party, and seeing the judge there, made up to him, and after a word or two about the weather, observed : 'That was an awkward blunder of mine the other evening, to take you for old Thornton !'

'And whom do you take me for now, may I ask ?' was the reply.

'Why,' said he, feeling rather bewildered by the other's manner, 'you told me you were Judge Poland, of Vermont.'

'On the contrary, sir, my name is Thornton,' was the annihilating response.

The victim to this case of awkward duality was not so much to be pitied as his fellow-countryman Slimmer, who fared worse from a similar mistake that was none of his making. Slimmer, a modest young bachelor, peeping into the ladies' waiting-room at a railway station, found a pair of plump arms round his neck, a lady's head resting lovingly on his manly bosom, and half-a-dozen youngsters of nicely graduated sizes clasping his legs, tugging at his coat-tails, and crying 'Papa !' at the top of their voices. While the half-strangled victim was struggling to disentangle himself from his affectionate surroundings, a gentleman rushed into the waiting-room, took the situation in at a glance, floored the innocent Slimmer with his carpet-bag, and then sat upon him. When he came to himself he was in bed in the infirmary, a bruised and battered bachelor ; and all he got for his pains was a grumbling apology from his assailant for the unfortunate mistake his wife had made. The common lot of sufferers from the mistakes of such over-hasty folk.

Jealous-minded people are particularly prone to misconceptions involving serious results. The captain of a schooner trading between San Francisco and Mexico left his wife in a tenement house in San Francisco. He had been away some twelve months, when one night as his wife was nursing the baby of a neighbour, the door of her room opened and she saw her husband standing looking at her. She rose to greet him ; but repulsing her with an oath, he turned on his heel and was gone, leaving her to cry herself to sleep. A knock at the door awoke her. Before she could reach it, her husband was in the room, his hand at her throat. Dragging her shrieking to the window, he would have thrown her from it ; but her cries had drawn a crowd in front of the house, and the unhappy woman managed to extricate herself from his strong grasp, only to feel a knife enter her flesh, and to fall senseless to the ground. The infuriated seaman made for the stairway, where he was met by a crowd of men. Threatening to shoot the first who came near him, he smashed in a door of a room, jumped through a window, and although pursued, reached the Chinese quarter, and was lost in its labyrinths. The occupant of the room through which he had dashed so unceremoniously, hearing the commotion without comprehending it, sprang out of bed and fired a shot ; upon which somebody outside in the hall fired another. 'Lynch him !' was the cry ; and in a very short time the guiltless occupant of the room was under a lamp-post, and would have been

dangling from it but for the intervention of the people about, who assured the excited mob that the actual assailant of the woman was already beyond reach. The woman was not killed; but whether her hasty mate discovered his mistake and atoned for it, is not recorded.

Not so tragical in consequence was another instance of jumping to conclusions. A blushing damsel of forty summers or so entered the town-clerk's office at Wheeling, West Virginia, and asked for a license. The clerk took down her name and address and asked for that of 'the other party.' 'Faithful; he lives with me,' said the applicant. The clerk eyed her curiously, but keeping his thoughts to himself, filled up the paper and handed it over. The lady glanced at it, shrieked out 'Monster!' and swept out of the office, leaving the offender dumfounded at the explosion; till it flashed upon his mind that possibly a dog license, not a marriage license, was what the spinster wanted.

Equally unhappy in interpreting a lady's meaning was a timid young man of Titusville. Calling upon a pretty girl one evening, she said: 'I want to propose to you'—

'You are very kind,' gasped the alarmed visitor; 'but I am not worthy of such happiness; in fact none of our family are marrying people—besides, my income is limited, and I have to meet a friend, and I'm afraid I'll be late.' He was making his exit without waiting to put on his overcoat, through the door of a cupboard.

'Why,' said the young woman, 'I wanted to propose to you to accompany me as far as Main Street; that was all.'

'Oh, in that case,' answered the relieved gentleman, 'I shall be only too happy.'

Ladies should eschew ambiguous expressions, and ambiguous actions for that matter. A lady visiting a great public library for the first time, grateful for the assistance rendered her by an assistant-librarian, slipped half-a-crown into his hand; of course the gentleman immediately returned it whence it came; and by-and-by had the pleasure of overhearing one of his fellows say to another: 'Well, I saw it all, but can't make out whether he was making love to the lady or the lady to him: but they were squeezing each other's hands!'

Mr Sayre of Lexington was troubled with a lisp. One day the overseer of one of his farms came to headquarters to say he wanted some porkers. 'Very well,' said Mr Sayre. 'Go and buy four or five thowth and pigth, and put them on the farm.'

The man inquired if he should take the money with him to pay for them.

'No,' said Sayre; 'they all know me. Thend them here, and I'll pay.'

In a fortnight's time the overseer reappeared with the information that he had been all over the country, but could not get more than nine hundred pigs.

'Nine hundred pigth!' exclaimed his employer. 'Who told you to buy nine hundred pigth?'

'Why, you did, sir,' said the overseer. 'You told me to buy four or five thousand pigs; and I tried to do it.'

'I did no thuth thing,' said Sayre; 'I told you to buy four or five thowth and their little pigth; a pretty meth you've made of it!'

Among the many good stories told by Colonel

Stuart in his *Reminiscences of a Soldier*, are the two following. A sentry at Chatham, when the captain of the guard questioned him as to his orders, replied: 'My orders are, sir, if a fire broke out, I'm to take my musket and shoot the nearest policeman.' The officer suggested he had made some mistake, but the soldier stuck to his text; and with 'I pity the policeman,' the captain of the guard walked on without giving the correct instruction: 'If a fire breaks out, fire your musket, and alarm the nearest policeman.'—A Scotch subaltern at Gibraltar was one day on guard with another officer, who falling down a precipice, was killed. He made no mention of the accident in his guard report, leaving the addendum, 'N.R. Nothing extraordinary since guard-mounting,' standing without qualification. Some hours after the brigade-major came to demand an explanation, saying: 'You say, sir, in your report, "Nothing extraordinary since guard-mounting," when your brother-officer, on duty with you, has fallen down a precipice four hundred feet and been killed.' 'Weel, sir,' replied he, 'I dinna think there's onything extraordinary in it: if he'd faun-doon a precipice four hundred feet and no been killed, I should hae thought it vary extraordinary indeed, and wad hae put it doon in my report.'

Taking things too literally is a fertile cause of amusing blunders. Two costermongers claiming proprietorship of one donkey, went to the Westminster county court to get the dispute decided. After hearing a part of the evidence, the judge said they had better settle the case out of court during the adjournment for luncheon. Upon the court reopening the defendant told His Honour it was all right; the donkey was his. Turning to the plaintiff, the judge saw his personal appearance was altered for the worse; but before he could put any questions, the defendant went on to say that they had found a quiet yard to settle it in, as His Honour had suggested. He had been rather rough on the plaintiff, but couldn't help it; they had only half an hour to pull it off in, and plaintiff was a much tougher customer than he looked to be. The explanation was conclusive, if not quite satisfactory to the court, and the donkey became the prize of the victor in the fight.

'Come up to the Capitol while we are in session, and I'll give you a seat on the floor of the House,' said a member of Congress to one of his supporters, who called upon him in Washington.

'Wall, no; I thank you,' said the West Virginian; 'poor as I am, I always manage to have a cheer to sit on at home, and I ha'n't come here to sit on the floor.'

A doctor, called in for the second time just in time to save the life of a man who during fits of intoxication was given to dosing himself with laudanum, rated his patient roundly for a good-for-nothing scoundrel, who, if he really intended to kill himself, should cut his throat and have done with it. One night the doctor's bell was pulled. Putting his head out of window, he saw the self-poisoner's wife, and heard her call out: 'He has done it, doctor.' 'Done what?' asked he. 'John has taken your sensible advice,' replied the woman; 'he has cut his throat, and will save you further trouble!'

The American poet must have been either very angry or very much amused, when his note to a friend, 'Come and see me; I am at

Barnum's'—meaning the hotel of that name in New York, elicited the answer: 'I am sorry you are going to exhibit yourself. If you had stuck to literature you would have made your mark and fortune. Whereabouts is the show now?' Ill-natured people might suspect the mistake was wilfully made. We should be sorry to suppose anybody capable of thinking the same respecting the extraordinary misconception under which an eminent divine laboured at a dinner-party. He was so dull and silent, that the lady next him expressed her fear that he was unwell. 'To tell the truth,' said he, 'I am not quite the thing; I have a presentiment that a serious illness is hanging over me—a peculiar numbness all down my right side seems to forebode paralysis; for I have been pinching my right leg all dinner-time, and can elicit no responsive feeling whatever; the limb seems dead.' 'If that is all,' said his fair neighbour, with a good-natured smile, 'you need not alarm yourself: the leg you have been pinching all the evening belongs to me!'—*Honi soit qui mal y pense.*

A FEW FRENCH NOTES.

Our lively neighbours, as journalists still sometimes delight to designate the practical, money-getting French of post-imperial days, have learned much in the stern school of adversity. Saddled with a weight of taxation that might crush the spirit and cripple the energies of a more robust race, they shew wonderful elasticity in developing new and unexpected sources of national wealth, and leave no stone unturned the turning of which may yield a profit.

If there was one branch of industry the revival of which seemed hopeless, it was the home manufacture of kelp, virtually driven out of the market by South American barilla. At its best the kelp trade had but helped the inhabitants of the Hebrides, the western Highlands, and other barren shores, to eke out a scanty livelihood by burning the sea-weed that the waves washed to their feet; while the preparation was primitive enough to have dated from the days of Ossian's shadowy heroes. Science, however, embodied in the form of M. Emile Moride of Nantes, has seriously taken in hand the task of utilising the heaps of wreck-weed that strew the bleak Breton coast, so as to derive the highest return for labour and capital invested. With the aid of a portable furnace, a ventilator or set of bellows for continuous blast, and two wheelbarrows, M. Moride provides for the cooking of his raw material. The furnace is built of dry stones, wrapped round in fresh wet weed, and is supplied with apertures which promote the rapid cooling of the 'sea-weed charcoal,' so called. The ventilator insures quick combustion; but the beauty of the process is that the bromium and iodine, apt, in the old-fashioned method, to be lost through over-roasting, are now preserved. There are at Noirmoutier alone two hundred of these furnaces at work, producing two million gallons of carbonised weed. Each furnace earns its annual fifteen or twenty pounds sterling, supplying as it does soda, potash, and other chemicals to the wholesale druggist, along with phosphates and salts of lime invaluable to the farmer. The pecuniary advantage over the ancient system is roughly estimated at sixty per cent.

France, which exports so enormous a number of eggs, is naturally desirous to content her chief customers, ourselves, by sending over the fragile freight in good preservation. Rubbing the shells with butter, lard, or moistened gum is the mode hitherto practised, but the grocer's stores have never quite rivalled the fresh products of the hen-yard. They may do so now, if we are careful to follow the advice of M. Durand, the Blois chemist. He coats over the shells of his new-laid eggs with silicate of soda, lays them separately to dry, being heedful that no speck of surface remains accessible to air, and consequently to decay, and stows them, for a year if required, in a cupboard. M. Sace of Neufchâtel, a Swiss chemist, not a French one, is reported to achieve as much by the help of paraffine.

Should we have the ill-fortune to be half-drowned, suffocated by unwholesome gases or vitiated air, or to fall down in a fit, Dr Woillez is ready with his new apparatus for artificial respiration. The patient's person, all but the head, is placed in a cylinder of iron, from which one stroke of a powerful pump extracts the air; the lungs and chest of the sufferer expanding as the vacuum is formed. Eighteen such mechanical breathings can be produced in the minute, and at each of these a quart of air—double the quantity inspired in normal health—rushes in to oxygenate the blood. The *spirospore* is beyond all doubt a potent agent in serious cases, but some cautious surgeons have expressed fears as to the secondary results which might attend its use.

Nothing but praise can be bestowed upon the successful efforts of M. Lenoir to construct a looking-glass which should neither grow yellow, and give us back a bilious presentment of ourselves, as silvered mirrors do, nor destroy the health of the workmen, as was the case in the old process of mercurial amalgamation. The new glasses are backed with silver, washed with quicksilver certainly, but in solution not in vapour, and therefore innocuous to those who handle it.

Alcohol, as we know, can be distilled from almost anything; but Apothecary-Major Ballard, of the Chercell Hospital, in Algeria, deserves some notice for finding out that Barbary figs, so called, will yield it in profusion and of excellent quality. The stoniest tracts of North Africa are indeed dappled with the flaming red blossoms of the prickly pear or cactus, and the fruit, guarded by its thorny envelope, can be had for the gathering. One ton and a half of these wild figs will give about sixteen gallons of colourless alcohol, at eighty-five degrees, and with a *kirschwasser* flavour. The same weight of beetroot yields but fifteen gallons of the far weaker spirit in common commercial demand; while beetroot, an exhausting crop, can only be grown on the best and most highly cultivated land.

The most enthusiastic advocates of ballooning would have hesitated to declare that submarine surveys were within the province of the *aéronaut*. Such, however, seems to be the case, since M. Duruof and his companion going up in a balloon, on the twenty-fifth of last August, at Cherbourg, and being at an altitude of five thousand feet, were amazed to see beneath them, with startling distinctness, every rock, fissure, and depression at the bottom of the sea. And yet the sea opposite Cape

Lévy, where the aerial voyagers obtained this bird's-eye-view, has an average depth of above two hundred feet. So limpid did the water appear that the under-currents were perceptible, whilst nothing would have been easier than to sketch or map the bottom of the sea.

A novel and perhaps a practically useful property of madder, hitherto only known as the active principle of a red dye, has been found out by M. de Rostaing. Meat covered with a layer of dry madder powder defies decomposition. It dries, however, slowly, wasting by desiccation so much that in the course of months it is reduced to less than half its weight. A more economical means of preserving meat is that employed at Buenos Ayres, whence beef, mutton, and even entire animals are constantly forwarded, in a state of perfect conservation, to Antwerp and Havre. The solution in which the meat is steeped contains borax and boric acid, saltpetre and a little salt, borax being the prime agent. The experiments of M. Dumas prove that borax destroys the soluble atmospheric leavens which would otherwise promote decay; and so far so good. But another *savant*, M. Peligot, who has dosed the plants in his garden with borax and killed them very promptly by so doing, suggests an ugly doubt as to the perfect wholesomeness of meat steeped in borax as an article of diet.

In spite of all the progress that has been made in electric science since first Volta put together his 'crown of cups,' a perfect galvanic battery is yet to seek. M. Onimus has done something towards this in availing himself of the virtues of the new, tough, and supple material which bears the name of parchment-paper. Every electrician knows that the great theoretical merits of Professor Daniell's 'constant' battery are counterbalanced by the trouble, care, and annoyance which it entails. All double liquid batteries have hitherto proved bulky, vexatious, and expensive; but M. Onimus simplifies matters by using parchment-paper instead of a porous cell, the copper spiral encircling the parchment, which is wrapped around the cylinder of zinc, and the pair of elements being simply plunged into a solution of sulphate of copper.

M. Leclanché, whose battery has for years past set in motion half the electric bells of Europe, has put what he considers the finishing touches to his well-known invention. He now, to compose his negative element, adds to his mixture of peroxide of manganese resin and hard gas-charcoal finely powdered, about four per cent. of the bisulphate of potassium, wedges the mass in a steel mould capable of enduring enormous pressure, and brings it first to a dull red-heat, and then under the action of the hydraulic press. We are assured that one cell of the improved Leclanché battery can heat a platinum wire to redness. A single element of Grove's or Bunsen's arrangement can do no more than this; and the result is the more creditable to the ingenious Frenchman that his is a 'constant' battery, excited by one fluid (the muriate of ammonia), and in which the consumption of zinc, always an important item, has been reduced to a minimum.

What we call vegetable isinglass, and the Chinese by the name of *thao*, and which has hitherto been derived from Eastern Asia, is now extracted from French sea-weed, and made useful in French

factories. It is in its crude state a yellowish gelatine, which the Industrial Society of Rouen has, after repeated experiments, succeeded in converting into what bids fair to be the best sizing for cotton cloths ever known. Macerated in water for twelve hours, boiled for fifteen minutes, strained, and stirred till it is cold, the *thao* gives a clear solution, which does not again become a jelly, and which can be laid cold upon any textile fabric, and left to dry. One invaluable property it has, since it defies, at common temperatures, damp and mildew; and is therefore already being applied to give lustre, not only to Rouen prints and Mulhouse muslins, but to the woollens of Puteaux and the silks of Lyons.

Ozone, the newest and the least stable of the gases, has recently been made to do good service in the sick-room. It makes short work with those miasmata and organic impurities of vitiated air which the Italians describe by the expressive name of malaria, and which every physician knows to be among the most baneful influences with which the convalescent patient, whose tenure of life is not yet quite assured, has to contend. A mixture should be made of permanganate of potash, peroxide of manganese, and oxalic acid, in equal parts, and two large spoonfuls with some water put into a plate and placed on the floor of the sick-chamber. Care should be taken, however, to remove steel fenders and fire-irons, and to cover up brass door-handles, since ozone will rust all metals meaner than gold and silver.

AUTUMN IN THE WOODS.

EVERY hollow full of ferns,
Turning yellow in their turns;
Straggling brambles fierce and wild,
Yielding berries to the child;
Oakballs tumbling from the tree,
Beech-nuts dropping silently.
Hosts of leaves come down to die,
Leaving openings to the sky;
Bluebells, foxgloves, gone to seed,
Everything to death decreed;
Nothing left of flowers or buds:
Such is Autumn in the woods.

And so is there an Autumn known
To the heart. It feels alone,
Fearing its best days are past;
Sees the future overcast;
Fond acquaintance broken through,
Friends departed, friends untrue;
Human flowers cold and dead
Covered by a grassy bed;
Hopes, late blossoms putting out,
Withering soon, and flung about
By cruel winds; dread doubts and fears
Finding vent in sudden tears;
Yes, there is an Autumn known
To some hearts thus left, alone.

Yet, there's this thought after all—
Ferns may fade and leaves may fall,
Hearts may change or prove untrue,
All may look as these woods do—
Though sad Autumn here is given,
Spring-time awaits the just in heaven.

THE GREEN FLAG OF THE PROPHET.

SINCE the commencement of the war between Russia and Turkey, the world has several times been startled by the announcement that the 'Flag of the Prophet' was about to be unfurled in the streets of Stamboul. Such an event, if it should happen (which may heaven avert), would proclaim a crusade in which all true Mussulmans would be bound to take an active part, and to fight against Christianity in every part of the world. They may be in India, Arabia, Egypt, or wherever else their scattered race has found a home; the raising of the green standard is a call which none may disobey without, as the Koran lays it down, sacrificing all his hopes of Paradise.

This fearful appeal to all the worst passions of the Eastern races hangs like a menace over the Mohammedan world; and if the word was once uttered and the dread flag unfurled, there is no telling to what sanguinary excesses it might lead an enthusiastic and half-savage people. It may be of interest to our readers if, under these circumstances, we endeavour to make them acquainted with the origin and history of a banner which has not seen the light of day since the Empress Catharine of Russia attempted to reinstate Christianity in the City of the Sultans, and which once unfurled, would set a whole world ablaze.

There have been many flags or signals used by various nations at different crises in their history to incite the peoples to battle on behalf of religions, dynasties, and ideas; but none has attained to the fearful notoriety which appertains to the terrible Flag of the Prophet, which is really a banner of blood, for it dispels the idea of mercy from the minds and hearts of its followers, and gives no quarter to man, woman, or child.

The Red Cross banner of the Christian Crusaders was an emblem of chivalry, mercy, gentleness, and love; but under its folds many a dark deed and many a shameless act were committed; and it was understood by the members of the Mohammedan faith to mean nothing less than the utter extermination of their race. This feeling, with its conse-

quent hatred of Christianity, shews itself even at this advanced period in the world's history, by the recent refusal of the Turkish government to allow its ambulance corps and hospitals to bear the red cross of the Geneva Convention (a sign which is entirely neutral, and is designed to protect its wearers while they are engaged on their errands of mercy to the sick and wounded of both sides), adopting instead thereof their own emblem of the crescent. Thus we see these rival emblems once more waving over the field of battle, though, happily, to mitigate rather than increase the horrors of war.

In France the 'oriflamme' or golden sun upon a field of crimson signified 'no quarter;' but this celebrated Flag of the Prophet means infinitely more than this. It is a summons to an anti-Christian crusade, a challenge of every believer in the Prophet to arms; a war-signal in fact, which, like the Fiery Cross of Scotland, would flash its dread command through the domain of Islam. In the interests of humanity, however, we may hope that the 'Commander of the Faithful' will never utter the dreadful word; for then indeed would the whole soul and strength of Christendom turn against the enemy of all civilised laws, human and divine.

The Prophet himself predicted that one day when his followers should number a hundred millions—which they do now, with twenty millions more added to it—his flag should fly against the advancing power of the northern races; and the Koran or Mohammedan Bible says that when its silken folds are flung forth 'the earth will shake, the mountains melt into dust, the seas blaze up in fire, and the children's hair grow white with anguish.' This language is of course metaphorical; but it is easy to conceive, by the light of very recent history, that some such catastrophe might take place, as the displaying of this terrible symbol would raise a frenzy of fanaticism in the breasts of the Mohammedan race all over the globe.

The origin of the insignia is a curious one. Mohammed gazing out upon a vast prospect of

fields, said : 'Nature is green, and green shall be my emblem, for it is everlasting and universal.' In course of time, however, it lost that innocent significance ; and amid his visions, the great dreamer saw the Green Flag floating as a sign that all true believers should take up their arms and march against the Infidel ; in fact the green turban was the sacred head-dress of the pilgrim or perfected Islamite who had gone to Mecca ; and hence the sanctity of this formidable standard.

When once unfurled, it summons all Islam by an adjuration from the Koran that the sword is the solitary emblem and instrument of faith, independence, and patriotism ; that armies, not priests, make converts ; and that sharpened steel is the 'true key to heaven or hell.' Upon that fearful ensign are inserted the words which are supposed to have been written at Mecca itself—namely, 'All who draw it [the sword] will be rewarded with temporal advantages ; every drop shed of their blood, every peril and hardship endured by them, will be registered on high as more meritorious than either fasting or praying. If they fall in battle, their sins will be at once blotted out, and they will be transported to Paradise, there to revel in eternal pleasures in the arms of black-eyed houris. But for the first heaven are reserved those of the Faithful who die within sight of the Green Flag of the Prophet.' Then follow the terrible and all-significant words, the fearful war-cry against God and man : 'Then may no man give or expect mercy !'

This is the outburst of barbarism with which the world is threatened in this year of grace 1877 ; and the reader cannot do otherwise than mark the cunning nature of the portentous words inscribed on the Prophet's banner. What would not most men do, civilised or savage, for 'temporal advantages ?' While to the Eastern peoples fasting and praying are looked upon as of so meritorious a nature, that to find something else which, in the eyes of Allah, would be deemed of greater value still, would be a desideratum which none would fail to grasp, by any means whatever, if it came within their reach. But Mohammed's wonderful knowledge of human nature, and more especially of Eastern human nature, is shewn in his picture of Paradise as prepared for the Faithful who fall in battle ; while his declaration that the highest heaven in this so-called Paradise will be reserved for those who die within sight of the Green Flag, is a masterpiece of devilish policy unequalled in the annals of mankind.

It scarcely needed the fearful words which follow to add emphasis to this dreadful appeal to the passions of a semi-barbarous race. Another motto on this sacred flag is not without significance at the present time : 'The gates of Paradise are under the shade of swords ;' and this alone would, if the flag were unfurled in the holy mosque of Constantinople, give to the Turk a moral power over his subordinates the effect of which it would be vain to calculate. Civilised though he partially is, he still firmly believes in the old doctrine of

kismet or fatality, and in angels fighting on his behalf ; not less implicitly than did his ancestors at the battle of Beder, where this formidable green standard was first unfurled. 'There,' says the historian, 'they elevated the standard, which Mohammed from his height in heaven blessed.'

Thus arose the great tradition of this sacred war-emblem, which it is a Turkish boast was never yet captured in battle, though it was once in extreme peril in a fight between hill and plain ; when Mohammed himself had it snatched out of his hands. Ali, his kinsman, however, thrust himself in front of a hundred spears, and won the victory with the immaculate flag flying over his head.

It is scarcely to be wondered at that a race so superstitious as the Turks should attach an almost miraculous value to such a symbol of their past history and their present power. It is a spell wherever their race or religion flourishes, and its invocation in the serious form now menaced cannot be regarded without anxiety. The day of the military apostles of Mohammed may be past, it is true ; but the tradition survives ; and the unfurling of this flag might be the spark which would set fire to the latent enthusiasm of the Mohammedan race and involve the world in a religious war.

We have referred to the great French banner, the oriflamme ; and it was that which led the French Crusaders through the Holy Land and headed the royal armies of France in the campaigns of the sixteenth century, while it also divided the Blue from the White in the Burgundian civil wars ; but this Flag of the Prophet to-day exercises a magical influence over one hundred and twenty millions of the human race, scattered about in Arabia, Syria, Asia Minor, Persia, and Egypt, over the Nile and the Ganges, and from Jerusalem to the Red Sea.

The desire of Mohammed, however, was, that while all pilgrims whose task had been duly fulfilled should wear the green turban, no sovereign in his succession should unfurl the Green Flag of the Faith unless Islam were in imminent peril. The unfurling of the banner would be performed with great religious ceremony, and in the presence of the Commander of the Faithful, who is himself supposed to carry it at the head of his army ; while a fearful curse would be called down upon the head of every Mohammedan who, capable of bearing arms, failed to rally round it.

The standard itself is not a very handsome one, and is surpassed both in value and appearance by many of the banners which belong to the various benefit societies and other mutual associations of men in this country. It is of green silk, with a large crescent on the top of the staff, from which is suspended a long plume of horse-hair (said to have been the tail of the Prophet's favourite Arab steed), while the broad folds of the flag exhibit the crescent and the quotations from the Koran already mentioned.

The state colour of one of our regiments of the Guards is a much prettier and more expensive standard than the great banner of Islam ; but (to such small things is man's enthusiasm attached) if the latter was the veriest 'rag' in existence, nothing could mar the beauty which the prestige of more than a thousand years has given to it in the eyes of a Mussulman.

The Flag of the Prophet is kept in the mosque

of St Sophia at Constantinople, and is in the custody of the Sheik-ul-Islam, or Mohammedan chief-priest, where all well-wishers of 'humanity may sincerely trust it will ever remain.

FROM DAWN TO SUNSET.

PART II.

CHAPTER THE SEVENTH.

DEBORAH and Mistress Dinnage were walking in the old garden, in the moonlight, on the mossed green walk along which they had played hound and hare in 'madder merrier days.' They walked slowly, arm in arm, talking plentifully and earnestly, and still the old difference shewed between them. Deborah, so cold with most of her own sex, and so wont to accept passively their enthusiastic tokens of affection and admiration, dealt only the most caressing tenderness to Margaret Dinnage; while Mistress Dinnage, on her part, returned with brusqueness and no outward show of affection whatever.

'I made him take it,' said Deborah. 'I know not what sore trouble had got hold of him. I think it was worse than need of money, or a greater debt than he has ever had before.'

'And he has gone to Master Sinclair? O Lady Deb, you should have made him see Sir Vincent first; though, good sooth, it is easier to preach than to practise, and it is no light task for ye to lead Master Fleming. But I, like you, abominate that old man. Whenever he rides up the chase, I say to father: "Father, the old fox comes! He wishes no good to Enderby."'

'I know it well; more strongly my heart tells me so each time. He comes for poor Deb Fleming; but time and coldness will soon unearth his cunning, and turn his hateful love to cruel hate.'

'Ay, and he will urge your brother on to ruin, in hopes of winning you.'

'O Mistress Dinnage, good Mistress Dinnage, say not so, so coldly! Sweet heart, how could this thing be? Marry the man who compassed my brother's ruin? You speak wisely!'

'Ah,' said Mistress Dinnage scornfully, 'you are blind; but I, shut out from all great folk's doings, can see and know them well. I can see how Master Sinclair, that old fox, would bring you and yours to beggary—ay, to shame—that he may say to ye: "Wed me; I will save your father and brother." He knows your love for them. He knows o' what stuff you're made. And indeed you'd be sore pressed between your love for them and your hate for Master Sinclair.'

'O Meg, say no more. You wrong me. I had rather see them dead. But what can I do? The swiftest horse would not catch Charlie now. O Mistress Dinnage, you have scared me, and I am not wont to be scared. What if Adam Sinclair drives him mad? gives him some great sum, and then has him up to pay it! No; stay! Charlie is not of age. But worse, if he refuses aid, and my poor boy flies the country. O merciful heaven! Deborah stood with her hands clasped upon her head, and her eyes regarding Mistress Dinnage wildly.

'No,' said Mistress Dinnage thoughtfully; 'this will not be. If Master Fleming is in debt, old Adam Sinclair will give him the money needful, and draw him on and on; for the time's not come

yet. Lady Deb, you must talk to him—to Master Fleming. You alone can save him, an' it's a down road he's goin'. If father hadn't spared the rod so oft, an' we hadn't screened him so oft from blame, this thing might not be. But that is past. If ye will save Master Fleming from utter ruin, now is the time.'

'Ay, you talk,' said Deborah scornfully; 'you had better turn a wild Arab horse afield, and bid me catch him. Don't I pray? Don't I plead to him—ay, till my very soul dissolves in words, to keep him at home from mad companions? What can I do? A sister cannot tether him. Love alone would save him.'

'Love? Ah, you speak to me o' what I know nothing; my heart, you know, is'—

'True as steel.'

'Ay, but as cold. But if a maiden's love indeed would save him, ask some one whom Master Fleming could love; ask Mistress Warriston; and he may come to love her.'

'Well; indeed he might. And May is an heiress too, and lovely. When Charlie cared not for her, he was a boy; and now he is grown a man, older than his years. Do you truly advise me to ask May here, who had indeed, we both thought long ago, some secret liking for my poor Charlie?'

'I don't advise,' quoth Mistress Dinnage. 'But, ask her.' Then again: 'Well, do as it pleases you. I won't advise. I know not if it would be for good or ill.'

'How could it be for ill?'

'It might break Mistress Warriston's heart, which is so tender!'

'How know you it is so tender?'

'Because it is worn upon her sleeve, and ever melts in tears.'

'I love her for that womanliness.'

The proud lip of Mistress Dinnage curled. 'Yes, it is well. Tears ease the heart, and ladies have time to weep.'

'You would never weep, whatever ailed ye. Oh, thou'rt a proud incomprehensible little maid. I would like to see thee well in love.'

'That ye never will.'

'Never boast. It is a sign of weakness, Mistress mine. But is there a doubt that Charlie Fleming would not love one so charming as May? Were I a man, I would worship her; and it is such bold spirits as his that love the soft and tender. Charlie will not woo; he looks askance to be wooed, and would love the maiden wooer! I know Charlie Fleming.'

'Then if he loves to be wooed,' said Mistress Dinnage, with a fierce scorn, 'let him seek it in the streets of Granta; fair enough women there, and ready too. I thought not that Master Fleming would love such kind!'

Deborah withdrew her arm from her companion's, and answered coldly: 'You offend me. You wilfully misunderstand me. But how can I look to be understood by one who knows no softness, no weakness of her sex! You have a hard, hard heart, Mistress Dinnage, if it be a noble one. The good you do is never done for love.'

'True enow, good sooth. But such poor love as ye describe, defend me from! It is water and milk at best. If God made me love, my love would lie so deep that the man who would win it must dig and dig to find it. Ay, hard!'

'Proud Mistress mine, do you value yourself thus highly?'

'Ay, I am a poor girl; but I have an honest heart, Mistress Fleming, and value it as highly as any lady in the land. He who loves, but thinks it not worth the winning, let him go; he who sets not such store by my love, let him go; and if the right man never comes, let the others go! If Margaret Dinnage could have loved, it would have been thus with her; and the hidden unvalued love would live and die within one heart.'

'I know it, I know it!' cried Deborah impulsively. 'O noble heart! *this* is the kind of love I can feel for, for I have it beating here;' and Deborah laid her hand upon her own breast. 'One thing you lack, Meg—that would make you perfect. *Love!*' Pleading, earnest, sweet, significant, tender, emphatic, was the utterance of the last imperative word, and Deborah's arms were round her friend, and her upturned face upon Margaret's breast. So in the moonlight the girls stood: a fair picture, for the head of Mistress Dinnage was turned aside, and her grave dark eyes averted; and in that moment each proud heart was revealed to each. 'Let thyself love,' continued Deborah, in her sweetest softest tones. 'Ye can be *too* proud, Mistress Dinnage. The day will come when ye will rue it bitterly. I would not urge ye, if I divined not the secret of another heart. Are you so blind that ye cannot see it too? The restlessness when you're not by; the wistful eye—that I dare not answer! O Mistress Dinnage, if Kingston Fleming had had *one* such look for me, in those old days, child as I was, I would have loved him before all the world, truly and unchangeably. Know ye not that I speak the truth? Would I urge ye to your ruin? When once a Fleming loves, he never loves but honourably. Then, his fate is not in *my* hands—but in *thine*.' There was silence. The last three words, though whispered, rang again and again in the listener's ears like music. What Mistress Dinnage thought then, was not told, but Deborah felt the wild heaving of her breast.

So a few moments passed, and Margaret put Deborah from her with firm but gentle hands. 'Talk no more of this,' she said, while they walked on. 'I will not be so stubborn as to seem ignorant of your meaning. But I do not think with you. No; do not speak, my sweet Mistress Deborah; no words will make us think alike. What! was it not so in the old days, that your heart would ever out-run your head, and ye *would* believe what ye longed for? Noble it is of ye to long for this; but Deborah Fleming, ye are like no other woman living, rich or poor. Ye are *yourself*; and I know you to be above all the littlenesses of woman-kind.'

Deborah blushed with pleasure. 'Hush, hush!' she said. 'This from you is too high praise; and dangerous, because you mean it all, and no flattery. But if it is noble to plead for one's dearest wish, and to choose above all rank and riches one's best and dearest friend, then I must be a very noble maid! But it seems to me simple nature, and no nobility. God has given me no ambition for great things; on the other hand, He has given me the power of loving faithfully; so that through all, with all her faults, never think but that Deborah Fleming will be true to her nature—true to those dearer than her own life!'

And then, Mistress Dinnage beginning, they talked of Kingston Fleming. A very frequent subject of conversation was he. It would not be fair to write all the nonsense that maidens will talk, even a Mistress Fleming and a Mistress Dinnage, for diamonds are found in dust. And they talked with great earnestness and gravity of the lace cap and discussed every minute point of dress; and what should be done if King Fleming came, and there was no host to receive him. Would he stay? Would it be seemly? Surely, with Dame Marjory—and much laughter even; for laughter and tears are near akin; and in April, sun follows showers.

CHAPTER THE EIGHTH.

The next morning, Deborah, in her great saloon, was tending her flowers and thinking of Charlie, when she heard her father's step. With a rush she was out, and the sun streamed out with her through the open door.

'My Rose of Enderby, art smartening up! The lad Kingston will be here to-morrow.'

Deborah's treacherous heart gave a great leap. 'Who told you so?' she asked calmly.

'This scrawl. Why, Deb, ye must look gladder than that; he is your cousin, ye know: or have ye forgot him?'

Deborah read the note in silence, and then her busy bewildered thoughts flew off. Oh, she must be calm; this would never do; she must be 'Mistress Deborah Fleming,' receiving in all cousinly courtesy the affianced lover of Mistress Beatrix Blancheflower, her rival beauty in a rival county.

'Father,' said Deborah, with sudden laughing joy, 'I must have some guests to meet him. Why, I have seldom had a party here; a very little money will go a long long way to make this bright and gay, and you have a store of good old wine still left. Wine, and flowers and *women*, father! What more do mortals want? And it will be returning Master Sinclair's generosity, which necessity weighs heavily on us, till it be paid. Oh, leave it to me, father, and you will think me a rare Mistress of Enderby!'

Sir Vincent looked round somewhat ruefully. 'Must it be, sweet heart, and even to-morrow? It cannot be.'

'It can. Trust in me. Why, father, you will be the gayest of the gay, as ye always are at such times. Dost give consent?'

'Why yes, tyrant. But ask Adam Sinclair.'

'Trust me.' And Deborah was out and away to Dame Marjory and Mistress Dinnage. The lord of Lincoln for once would be welcomed!

It pleased Deborah to have a banquet in the hall and music in the saloon. Why, she had twenty pounds a year; and good lack! one could not *always* contemplate ruin. A Fleming was coming home; they would 'kill the fatted calf.' Such pleasures were far between.

It was short notice, but willing messengers were soon afoot, and Granta was laid under requisition for guests. Deborah, happy and proud, sent the word to all invited guests that short notice was involuntary on her part; her cousin Kingston Fleming was coming home suddenly, and who could, must come and dance at Enderby. So what with Granta men and young belles of

Deborah's age, and a few old dowagers and a few Adam Sinclairs, the party was made up. Deborah was lucky. She, in her sheeny lovely dress, was well-nigh worshipped by the men, she looked so full of life, so brilliant. But no Charlie! That was the one drawback; nor did Adam Sinclair know where he was, save that he had left Lincoln the day before in good spirits. Deborah knew in her heart what that meant. As she conversed, she looked full at Adam Sinclair, and felt to love all man and woman kind. The aged wooer trembled before the gracious girl; time only heightened his passion and hardened his determination to win Deborah Fleming at all hazards. The county had already begun to whisper about his infatuation and her coldness.

Eyes enough were upon them though, and the dowagers decided that so far from being 'cold,' Deborah Fleming encouraged him by every means in her power.

'Mistress Fleming,' he whispered ardently, 'give me some token to-night—some slight token of favour. Your eyes look kind to-night. Give me that rose.'

Deborah glanced at the red rose in her breast. 'This rose, Master Sinclair? Nay; not this: there are a thousand others in the garden. Marjory shall bring ye one.'

'I covet this one, Mistress Fleming, warm from your heart. What is it to you? And I would give a hundred crowns to possess it.'

'It would seem perchance a love-token, and those I never give.'

'Ye are obdurate.'

Deborah turned away from those gleaming eyes. 'I am honest,' she said.

'Mistress Leyton,' said Adam Sinclair, turning with a courtly smile to an old dame who was sitting near, drinking elder-berry wine and listening open-eared, 'will ye not plead my cause? Here is Mistress Fleming will give me nought. And what do I ask? Nothing, but that red rose from her gown.'

'What would you do in my place, Mistress Leyton?' asked Deborah.

'Why, if I favoured Master Sinclair, I would give him the rose.'

'You put it very strongly,' laughed Deborah. 'But you have released me from my strait, for I could neither be so bold as to favour Master Sinclair nor so rude as to shew him none; so I give my rose to you.'

'Keep it, child; it looks so lovely. It suits too thy name—Rose of Enderby.'

'Mistress Leyton, you must bring this Rose to Lincoln one day,' said Adam Sinclair. 'Now do this much for me, for old acquaintance' sake!'

'But will Mistress Deborah come?'

'I know not,' answered Deborah, smiling. 'What I would like now, I may not like to-morrow.'

'Thou art a spoiled child and a wilful one.'

'Yes; I fear me it is so. But Master Sinclair, I am not ungracious.'

'I think ye are. Come one moment to this window.' He led Deborah into the recess, and asked her to gather him a rose, a red rose. The brilliant lights flashed athwart them; near by stood a bevy of young and scowling men; the roses were laughing and fluttering about the casement. The tall old figure was bending down, and Deborah, gay yet reluctant, and looking gloriously

beautiful, raised her eyes to present the gift, when Kingston Fleming entered.

He had heard enough on the way about 'Mistress Deborah Fleming' and 'Master Sinclair'; all rumours united their names, till he knew not what to believe, but laughed and wondered. So, with his old indolent curiosity, he looked up at Enderby, and saw lights gleam through the great windows, heard music, and saw dancing forms flit by. He raised his glass, and laughed. 'Why, Deb is queening it right royally! I imagine Master Sinclair is among the guests.' And wondering at it all, and greatly edified, Master Kingston Fleming, having first put his travelling-dress in some slight order, was conducted by Dame Marjory along the gallery. 'Are they often so gay, Marjory?' he asked, laughing at her grim but important countenance.

'Never, never, Master King! Bless thee, no. There are lonesome hours enow at Enderby, an' Master Charlie never here. This is a whim of the young mistress to welcome thee, Master King; and her features relaxed into a grim smile. 'She has such a whim now and again.'

So Kingston Fleming entered, and saw the picture we have drawn. From that moment the mad young hoyden faded for ever from Kingston's mind, into the stately beauty who stood there. She turned, the colour flushed to her cheeks and light sprang to her eyes. 'Kingston!'

'Why, Deb! But "little Deb" no longer. How changed! I scarce know you.'

Then Sir Vincent came forward, and they were parted, for Mistress Fleming had duties to fulfil. But ever Kingston's eyes followed her, though she had no eyes for him. Then there was the dancing, and all were seeking Deborah; she was surrounded; and often she saw herself in the tall old mirrors, and her beauty flashed on her like a surprise. Deborah Fleming carried all before her that night; she sang—that was her one perfect gift; she had a splendid voice, and sang with power and sweetness, and some deep emotion threw passion into her song that night. Then there was the supper, when Adam Sinclair sat on Deborah's right hand. Then another measure. But Kingston would not dance, though he loved it with enthusiasm. Then there was the hour of two tolled out from the chimes of Enderby, and the last carriage rolled away.

'Come down and smoke a pipe, boy,' said Sir Vincent; and Kingston said he would follow.

Deborah, tired, but strangely happy, had thrown herself on a sofa. 'Not yet, King,' said she. 'You have been away for two long years; you have much to tell me, sure. You have seen May Warriston?'

'Ay; in a picture-gallery at Florence.'

'Was she changed?'

'She was prettier and graver. I even thought little May somewhat staid and prim; but then old Guardly was at her elbow.'

'Did she speak of me—of us?'

'Of you, a hundred times.'

'Sweet May! And you, Kingston'—Deborah blushed and hesitated—'you have come from Rimbolton?'

'Yes.'

(Why would he not speak, and aid her?) Deborah continued shyly: 'And is—Mistress Blanchefflower well?'

'I thank ye, very well.'

Deborah could say no more anent that. 'Are you changed, King, in looks? Let me see.' She bent forward, and laid one hand upon his. 'Nay; the old comie King, with whom I oftentimes quarrelled sore; only browner, thinner, graver too, as I see thee now.'

'Cares o' the world, Deb. Where is boy Charlie?'

'Nay; I know not.' What a sudden paleness and abstraction overspread the sweet face! 'Charlie is much away, Kingston. I hope you will see him and talk to my dear boy like a good kinsman. Charlie needs a sterling friend.'

Kingston looked grave, thinking perhaps how far he himself had led Charlie from the straight and narrow track. He answered gaily, however: 'Oh, he is young yet. Charlie promised to be a fine fellow in the end; and with his talents, we must make something of him. Don't despair, Deb.'

'Nay; I never despair.'

'I hear that he is a friend of Master Adam Sinclair's.'

'Yes. Didst hear that at Rimbolton?'

'Yes; and elsewhere too.'

'Then ye have doubtless heard most tidings?'

'Yes, Deb. Tidings spread like wild-fire on a country-side; but I don't credit all I hear, or I should believe ye to be betrothed to Adam Sinclair.'

'When I tell you, you may believe that, not till then,' answered the maiden.

Then followed a long silence, and Kingston looked on vacancy through the fading rose on Deborah's breast. O irrevocable past! O vague dark future! 'You used to hate me, Deb,' said he suddenly, at last.

'Ay! Did I? Well, perhaps I hate you now.'

'Perhaps you are grown a little hypocrite, as you give me kind smiles in place o' former frowns.'

'That is a necessary duty. I smile at Master Sinclair.'

'There is no disguise *there*. It springs from the heart, Deb.'

'You can read my heart then? No; I do not hate you, Kingston; I love you as my kinsman and my brother's truest friend.'

'Not always his true friend, Deb,' said Kingston quickly. 'Don't give me more than my due.'

'Well, I don't hate you for your candour, but rather love you, King.'

'Dost love me, Deb?'

Kingston Fleming looked up strangely and suddenly from under his long love-lock with his old arch smile, but there was a wistful sadness in it too.

Deborah blushed scarlet at the sudden question. 'Love ye?' she begged curtly, to hide her confusion. 'Ay, well enough. We *shall* be friends, I know. We will quarrel no more, King; we two *must* be friends.'

'Friends, sweet heart—*friends*? What ailed him as he murmured these words? He seemed like one distraught. Springing up, he paced to and fro the long length of the saloon, then stopped before the maiden.

'Well, good-bye, Deb. I am tongue-tied in thy presence. I had better go. Kiss me!'

Deborah blushed. 'Nay; I never did that.'

'Is that a reason ye *never* should?' And Kingston stooped and kissed her.

He was gone. Was it pleasure or pain that caused Deborah's heart to beat so wildly?

'Oh, this must not be,' she exclaimed passionately. 'This shall not be. I love him madly. And he? Oh, shame on me, to let him do this thing, and trifle with me thus! He, affianced meantime to Mistress Blancheflower; and thinks the while to play with Deborah Fleming's heart!' The girl started up, and paced where Kingston had paced before her. 'Two can play at this,' she said. 'Ah, Master King Fleming, if ye think to lower a Fleming's pride, it shall go hardly with ye! But if ye mean well, I will bless thy future, and still love thee—as neither friend nor foe.' Deborah's voice sank to a whisper of unutterable tenderness. 'Friends, sweet heart—*friends*? What meant he by that, but to put vain and wicked love-thoughts in my head? Can I believe thee so dishonoured, Kingston? Thou, whom I thought the soul of honour! It cannot be. But I will watch thee well. Love thee as a *friend*, forsooth! It is Deborah Fleming's curse to have a heart true to one life-long love, one long unmaidenly love—because unsought, unearned for. Ah me! I fear myself. I dare not think on Mistress Blancheflower, lest I seek to do her some grievous harm. I dare not think on that marriage-day. O Beatrix Blancheflower, do ye love him well? So well, that ye are worthy of my sacrifice? Ah! why did King Fleming come here! For the love of honour and of good faith to Mistress Blancheflower, I will estrange him from me.'

ITALIAN VAGRANT CHILDREN.

LITTLE Giovanni Alessandro Bosco, the bright-eyed Italian boy who has a couple of white mice to attract the attention of passers-by, or believes that kind folks will perchance give a copper for hearing a tune played on a small barrel-organ, is not perhaps aware that he has risen to the dignity of being officially noticed. In other words, Italian organ-boys, image-boys, street exhibitors, and appellants to a compassionate public, have been the subject of correspondence between the diplomatists of Italy and those of England. The despatches or communications have lately been published in a blue-book or parliamentary paper; shewing that European governments are now alive to sympathies which would have had but little chance of manifesting their presence in an earlier and ruder state of society.

About three years and a half ago, we gave an account of what had come under our knowledge in Italy concerning the deportation of Italian boys as beggars or exhibitors. We stated that 'Much to its credit, the parliament of Italy have before them a bill to abolish the system of apprenticing children of less than eighteen years of age to strolling trades or professions, such as mountebanks, jugglers, charlatans, rope-dancers, fortune-tellers, expounders of dreams, itinerant musicians, vocalists or instrumentalists, exhibitors of animals, and mendicants of every description, at home or abroad, under a penalty of two pounds to ten pounds for each offence, and from one to three months' imprisonment. It is to be trusted that this will shortly become law, and so put an

end to one of the most crying evils of our time.' Subsequent facts shew that, although this law has passed in Italy, and may in that country be producing some good results, it has not in any way lessened the number of vagrant Italian children seen in the streets of London and other English towns. How it happens that the remedial measure has not relieved our shores from this incubus, we will explain presently; but it may be well first to summarise a few of the statements in the former article, sufficient to shew the mode in which this cruel traffic is carried on.

In years gone by, when Italy was split up into a number of kingdoms, dukedoms, and petty states, very little attention was paid to the general welfare of the people; the peasants and small cultivators were often so hardly driven that the support of a family became a serious responsibility; and a people, naturally kind rather than the reverse, were tempted to the adoption of a course from which their better feeling would have revolted. They did not actually sell their children, but they apprenticed them off for a time, on the receipt of a sum of money. The *padroni* or masters, to whom the children were apprenticed, were men whose only sympathy was for themselves and their own pockets; they made specious promises, and got the poor young creatures, eight years old or so, into their hands. Too often, the parents never saw the children again, and remained quite ignorant of their fate. It was not in Italy that the scoundrels kept their victims; they mostly crossed the Alps into France, whence many of them found their way to England. Or else they were shipped at Genoa, and conveyed at cheap rates to such shores as seemed likely to be most profitable to the *padroni*. As these men acquire an accurate knowledge of the extent to which sheer open beggary is illegal in this or that country, they adopt a blind, by turning the poor children into exhibitors of white mice, marmots, or monkeys. Advanced a little in age and experience, the boys are intrusted with small organs, and perhaps later with organs of larger size. Those whose strength of constitution enables them to bear a life of hardship during the so-called apprenticeship can sometimes obtain an organ on hire from one of the makers of those instruments, and become itinerant organ-grinders on their own account. But there is reason to fear that the poor boys too often succumb to the treatment they receive, and die at an early age. As to what befalls the girls thus expatriated, another sad picture would have to be drawn.

No resident in London, no visitor to London, need be told of the organ nuisance. Some of the organs, it is true, are really of excellent tone, and play good music; but they become a pest in this way—that the men, taking note of the houses whence they have obtained money, stop in front of those houses more and more frequently, in the hope of being paid, if not for playing, at least for going away. Some of these organ-men have been organ-boys who came over with *padroni*.

And now for the diplomatic correspondence relating to this subject.

In 1874 the Chevalier Cadorna, Italian Minister at the Court of St James's, addressed a communication to the Earl of Derby relating to these wretched and ill-used children. He stated that a law had been passed in Italy, the success of which would depend largely on the co-operation of other governments. It had been ascertained that in many provinces of that country parents lease or lend their children for money; boys and girls under eight years of age, who are taken by vile speculators to foreign lands, there to be employed as musicians, tumblers, dancers, exhibitors of white mice, beggars, &c. It is a white slave-trade, in which the unfeeling parents participate. London is especially noted for the presence of these unfortunates; the *padroni* or masters find that a good harvest may be made out of the injudicious because indiscriminate charity of the metropolis. 'Miserable it is for the children,' says M. Cadorna, 'if they fail any day to obtain the sum which their tyrants require from them! This is the reason why we often see them wandering about till late at night, exhausted by fatigue and hunger, rather than return to the lodgings where they dread ill-treatment of various kinds from their pitiless masters.' The police magistrates of London are frequently occupied in listening to the complaints of these poor creatures. But no: this is hardly the case; for the victims are generally afraid to make their sorrows known, lest they should suffer still worse from the vengeance of their taskmasters; sometimes, however, they are too ill from bad treatment to conceal their misery; while at other times they are taken up for begging. Who knows? perhaps the poor things receive better food and lodging during a few days' imprisonment—certainly better in a reformatory or a workhouse—than in the squalid rooms which their tyrants provide for them.

The Italian government are endeavouring to check the evil at its source or fountain-head; making the leasing of children by their parents illegal. If this does not produce a cure, then they are endeavouring to watch the slave-traders (as we may truly call them), and forbid them to carry their victims across the frontier or out to sea. When the Chevalier Cadorna made his communication to the Earl of Derby, the new law had been too recently passed to supply evidence of its practical effect; but he pointed to the fact that the law could not meet with full success unless foreign governments would render aid, by making this kind of Italian slavery unlawful in the countries to which the *padroni* bring their little victims. A suggestion was made that the Extradition convention, signed between England and Italy, might possibly be made to take cognizance of this state of things. Not so, it appears. The Home Secretary, when appealed to, stated that traffic in children is not within any of the crimes named in the English Extradition Acts. 'It appears to Mr Cross that

the source of the evil arises in Italy, and that measures might be there adopted for preventing the egress from that country of such children as are described in the letter of the Italian Minister. He supposes that it would be competent to the Italian government to decline to grant passports for such children, and thus prevent their crossing the Italian frontier. There is no power to prevent such children from landing in this country. All that can be done is to protect them from any cruelty or ill-treatment on the part of *padroni*; and Mr Cross is assured that the metropolitan magistrates are most anxious to carry out that object, and that they are very desirous to abate the evils as far as our laws empower them to do so.

So the matter rested for a time. Three years later, in May of the present year, the subject was mentioned in the House of Commons; and the Italian Minister, General Menabrea (successor to the Chevalier Cadorna), informed the Earl of Derby that the Italian government cannot effect all they wish in preventing the exodus of the *padroni* and their victims. 'It is easy for them to elude the vigilance of the authorities; for passports being now practically abolished from Italy to France, and thence to England, the traffickers in children can, by expatriating themselves, relieve themselves from the punishments they have incurred.'

Thus the inquiry ended nearly as it began, so far as definite conclusions are concerned. England is very chary of making restrictions on the freedom of entry of foreigners on our shores. Deposed emperors and kings, princes in trouble, defeated presidents and past presidents, persecuted ecclesiastics, patriots out of work—all find an asylum in little England; and many things would have to be taken into account before our government could legally forbid the Italian children and their *padroni* from setting foot on English ground.

No one can glance habitually through the daily newspapers without meeting with cases illustrating the condition of the poor Italian children. Some months back the magistrates of North Shields had a boy and a girl brought before them charged with begging. The fact came out in evidence that their *padrone* had bought or farmed them of their parents, and brought them to England. Marianna Frametta was fourteen years of age, Marcolatto Crola eleven. He had bought or rather leased them for twelve months, at ten pounds each: his calculation being that this sum, four shillings a week, would be amply covered, and much more, after providing them with board and lodging, by their earnings. They usually, it appears, got from nine to fifteen shillings a day by begging, possibly with the addition of some small pretence to an exhibition of white mice. If they brought home less than ten shillings each, they were beaten instead of fed at night. These sums appear strangely large; but so stands the record. It is satisfactory to know that the fellow was punished with imprisonment and hard labour for his cruelty. But what would eventually be the life of the children themselves? They were sent to the workhouse for temporary shelter, food, and medical treatment; these could only last for a time; and

the youngsters would still be aliens, without definite occupation or means of livelihood.

There can be no doubt that the English habit of giving small sums of money to people in the streets and at the street doors has something to do with this matter. It may be due to a kind motive, but it unquestionably increases the number of applicants, and opposes a bar to the endeavours of governments and legislatures to bring about an improvement. Nevertheless it is quite right that all should be done that can be done to prevent ruthless speculators from bringing over poor Italian children to our shores, and then treating them like veritable slaves. This should all the more sedulously be attended to, because the *padroni* (so far as concerns the metropolis) live almost exclusively in one district, around Hatton Garden and Leather Lane. The narrow streets, courts, and alleys in that vicinity are crowded with them; every room in some of the houses being occupied by a distinct Italian batch, crowded together like pigs in a sty, and forming hotbeds of disease. When the 'Health Act' and the 'Lodging-Houses Act' gave the police power to enter such wretched apologies for dwellings, fearful scenes of this kind were brought to light. Matters are gradually being improved, but only by dint of constant vigilance.

Evidently there is an anxiety on the part of the Home Secretary to do all in his power to suppress the scandal, as is evidenced by the following circular, addressed to the police authorities of the metropolis: 'The attention of the Secretary of State has been called to the practice under which children bought or stolen from parents in Italy or elsewhere are imported into this country by persons known by the name of *padroni*, who send them into the streets to earn money by playing musical instruments, selling images, begging, or otherwise. It is most important to suppress this traffic by every available means, and Mr Cross relies on the vigilant co-operation of the police for this purpose. In many cases the employer will be found to have committed an offence against the Vagrant Act, 5 George IV. cap. 88, by procuring the child to beg. If so, he should be forthwith prosecuted, and the result of such prosecution should be made the subject of a special report to the Secretary of State. The child will probably come within the provisions of the 14th section of the Industrial Schools Act, 1866 (29 and 30 Vic. cap. 118), either under the first clause (as a child begging alms), or under the second clause (as a child wandering and without proper guardianship). An application should therefore be made to the justices for the child to be sent to a certified industrial school. Further application should be made, under section 19, for the temporary detention of the child in the workhouse until the industrial school has been selected, information being at once communicated to the Secretary of State, in order that, if requisite, he may render assistance in making the necessary arrangements. The final result of each case should also be reported to the Home Secretary.'

In conclusion, we are glad to see from the newspapers that the Brighton School Board, by enforcing the provisions of the Elementary Education Act, have been successful in terrifying the *padroni* who bring Italian vagrant children to the town, and thereby have banished them with their unhappy victims. The circumstance offers

a good hint to local authorities. Rigidly apply the School Act, and we shall probably hear no more of the infamous practice of importing Italian children for vicious purposes.

MAJOR HAMMOND'S RING.

'WHAT'S this?' cried Miss Hammond, breaking open a letter just handed to her by a servant. 'You read it, Maggie; your eyes are better than mine.'

Small wonder at that indeed, seeing that Maggie is aged about eighteen, and the other sixty-five at the very least, a pleasant-looking, well-preserved spinster, with a brown resolute face and sausage curls over the forehead. Maggie, a handsome modern girl, sits down and reads:

MADAM—The parishioners of St Crispin, Gigglesham, in vestry assembled, have determined to rebuild their parish church, pronounced unsafe by the surveyors. Contributions are earnestly requested. The alterations will necessitate the removal of many vaults and graves; among others, that of the Hammond family. It is the wish of the churchwardens to respect the wishes of survivors and others in the disposal of the remains. Any directions you may have to give, you will be good enough to communicate to the undersigned.—Your most humble obedient servants,

THOMAS TRUSCOTT,
WILLIAM BONNER,
Churchwardens.

The two Misses Hammond (Margaret and Ellen) are joint proprietors of the comfortable estate of Westbury, near Gigglesham, and of the handsome mansion thereto belonging. Maggie, the young girl, is a distant cousin—although she calls them 'aunt'—and lives with them. There is also a young man, Ralph Grant, somewhere about the place, of whom more anon.

Old Tom Hammond, the father of the two maiden sisters, was born in the year 1740, and might have seen the heads over Temple Bar after the rising of 1745. He lived till 1830. He had married late in life, and left only these two daughters. Thus two generations bridged over a space of time generally occupied by many successive lives; as in the case of another branch of the family, the founder of which, Major Richard Hammond (the uncle of the two old ladies), who had been at the capture of Quebec when General Wolfe was killed, being the great-grandfather of Maggie Lauderdale and Ralph Grant. Major Hammond was the elder of the two brothers, and should have inherited the Westbury estate; but he offended his father, General John Hammond, by what was called a low marriage, and was disinherited in consequence.

Tom Hammond had done his best to remedy his father's injustice, as far as he could without injuring himself and his own, by making a settlement of the estate, in failure of his own issue, upon the lawful descendants of Major Hammond, his brother; providing that if the issue of his elder brother should fail, the estate should go to the issue of a younger brother Henry, who, by the way, had been well provided for by the small estate of Eastbury. This brother Henry was now represented through the female line by a Mr Boodles of Boodle Court, who now also held the Eastbury estate.

The descendants of Major Hammond are now confined to these two young people, Maggie and Ralph. They are both orphans and without means, their forebears having been mostly in the soldiering and official lines. Ralph is a lieutenant in the artillery, and his battery is now in India; but he is at home on sick-leave; and he has taken advantage of his furlough to win the affections of his fair cousin. As the Westbury estate would come to be eventually divided between them, it was considered a most fortunate thing that the young people had come to an understanding. Ralph was to leave the service when he married, and take the home-farm. By-and-by he would fall naturally into his position as country squire; and it was arranged that eventually he should assume the name of Hammond; hoping to continue the old line.

This preamble being necessary, let us now return to the comfortable old-fashioned drawing-room at Westbury.

'What do you think of that, Ellen?' cried Miss Hammond, having read over once more the circular to herself with subdued emphasis. Miss Ellen was sitting looking into the fire, her great wooden knitting-pins and bright-coloured wools lying idle on her lap, as she shook her head while talking gently to herself.

'Do you hear, Ellen?' cried Miss Hammond more sharply. 'What do you think of that letter from Truscott?'

'I don't like the idea at all, Margaret. No, not at all. Why can't they leave our ancestors alone? And I am sure I always looked forward to being buried there myself.'

'La! don't talk about that, Ellen, and you five years the younger!' said Miss Hammond briskly; 'and as we can't prevent its being done, we must make the best of it. Ralph had better go and see to it.'

'Very well, sister; as you like,' said Ellen. Presently she resumed: 'Sister, I've been thinking that this would be a good chance to try to get back Uncle Richard Hammond's ring.'

'Uncle Hammond's ring!' repeated the elder sister. 'I don't understand.'

'You must have heard our father talk about it. The family ring that ought to have gone with the estates—a ruby and sapphire that General Hammond brought home from Ceylon.'

'I ought to know all about it Ellen, I daresay; but you were so much more with my poor father, and had more patience with his stories.'

'My father often tried to get the ring, and had offered to give Major Hammond a large sum for it. But he was so vexed with father for supplanting him, that he vowed he never should have it; and they say, sister, that rather than it should ever fall into his brother's hands, he had it buried with him, upon his finger. Our father always said that if he had a chance he would have the coffin opened to see.'

Maggie, who had retreated to a sofa, and buried her head in a novel, roused up at this, and joined in: 'I hope you will, auntie. I do hope you'll have it looked for.'

'I don't know, my dear,' said Miss Hammond. 'I don't approve of violating the sanctity of the tomb.'

With the elder Miss Hammond, a phrase was everything; she delighted to bring a thing within

the compass of a well-rounded phrase, upon which she would then make a stand—invincible. So Maggie threw up her head in a kind of despair, and ran off to look for Ralph, who when last heard of was smoking a cigar on the terrace.

'Ralph!' said Maggie as soon as she had found him, and had submitted to a very smoky kiss—they were in the heyday of their young loves, when kisses were appreciated, even when flavoured with tobacco—'Ralph! auntie is going to give you a commission—to go and see about a vault at St Crispin's where some of our ancestors lie.'

'I know,' said Ralph; 'they are going to pull the old place down. All right; I'll do it.'

Then Maggie went on to tell him about the ring, and how Miss Hammond would not have it searched for. 'But it is a very valuable ring—a family one too. It would be a great pity to miss it, if it's really there.'

Ralph agreed.

'Well, then, mind you look for it, sir; only don't say a word to auntie, or she'll put a stop to it.'

'I'm fly,' said Ralph, with a knowing wink, and attempted a renewal of the osculatory process; but Maggie escaped him this time, and came fleeing in at the dining-room window panting into the presence of her aunts.

Since she first left the room, a visitor had appeared—a Mr Boodles, a distant relative, who had inherited some of the family property, as before explained; a tall grim-looking man, with thin iron-gray hair, carefully brushed off his temples.

The aunts were looking rather serious, not to say frightened, and both started guiltily when they saw Maggie.

'Leave us, my dear, please,' said Miss Hammond gently.

Maggie had just caught the words, 'No marriage at all,' from Mr Boodles, who seemed to be speaking loudly and excitedly; and she went out wondering what it all meant. Some piece of scandal, no doubt, for Boodles was the quintessence of spitefulness.

'It is very dreadful—very,' said Miss Hammond. 'I never had much opinion of Uncle Richard, you know; but for the sake of the young people, I hope you'll let it be kept a profound secret.'

'Sake of the young people!' screamed Boodles at the top of his harsh voice. 'And what for the sake of old Boodles? I'm the next heir, you'll remember, please, through my maternal grandfather, Henry Hammond.'

Mr Boodles had come to Westbury to announce an important discovery that he had recently made. In turning over some of his grandfather's papers he had come across some letters from General Hammond, in which it was firmly asserted that his son Major Hammond had never been legally married to the woman known as his wife.

'What end do you propose to serve, Mr Boodles, by bringing this ancient scandal to light?' asked Miss Hammond with agitated voice.

'End!' cried Boodles. 'This is only the beginning of it. I am going to a court of law to have myself declared heir to the Westbury estates under the settlement.'

'In that case,' said Miss Hammond, rising with dignity, 'you cannot be received on friendly terms in my house.'

'Oh, very well, very well,' cried Boodles, snatch-

ing up his hat and whip, and sweeping out of the room without further ceremony.

As soon as the door had shut upon him the sisters looked at each other in blank consternation.

'I always feared there would be a difficulty,' said Ellen tremulously; 'but oh, to think of Boodles having discovered it!'

'We must send for Smith at once; the carriage shall go in and fetch him,' said Miss Hammond, ringing the bell.

Mr Smith of Gigglesham was the family solicitor, and the carriage was sent off to bring him up at once for a consultation. But Smith brought little encouragement. He had heard from his father that there were curious circumstances attending Major Hammond's marriage, and if Boodles had put his finger on the flaw—Smith shrugged his shoulders for want of words to express the awkwardness of the case.

'But search must be made everywhere; the evidence of the marriage must be found; the children must not suffer, poor things, and always brought up to look upon the property as their own!'

'Why, they could never marry,' cried Miss Ellen; 'they could never live on Ralph's pay.'

'It's altogether dreadful; and not getting married is the very lightest part of the calamity,' said Miss Hammond.

Smith undertook that every possible search should be made, and went away, promising to set to work at once. But his inquiries had no result. He had traced out the family of the reputed wife, who had been the daughter of a small farmer living at Milton in Kent; but they had now fallen to the rank of labourers, and had no papers belonging to them, hardly any family traditions. He had searched all the registries of the neighbouring parishes: no record of such a marriage could be discovered. He had issued advertisements offering a reward for the production of evidence: all of no avail. What more could he do? To be sure there was a presumption in favour of the marriage; but then if Boodles had documents rebutting such a presumption—Again Mr Smith shrugged his shoulders, in hopelessness of finding fitting words to represent the gravity of the crisis. 'And then,' he went on to say, 'the very fact that Boodles is spending money over the case shews that he thinks he has a strong one.'

Boodles did not let the grass grow under his feet; he instituted proceedings at once, and cited all interested to appear. The thing could no longer be kept a secret; and Maggie and Ralph were told of the cloud that had come over their fortunes.

'I don't care if the property does go away,' said Maggie bravely. 'It will make no difference. I shall go to India with Ralph, that's all. I will be a soldier's wife, and go on the baggage-wagons.'

Ralph shook his head. He had never been able to manage on his pay when there was only himself, and there were ever so many lieutenants on the list before him, so that he could not hope to be a captain for many years.

There was no use in sitting brooding over coming misfortunes; and Ralph took the dogcart and drove over to Gigglesham, to see about the family vault at St Crispin's. It was an occupation that agreed well with his temper; the weather too seemed all in keeping—a dull drizzling day.

'Don't forget the ring,' Maggie had said to him at parting; 'that is ours, you know Ralph, if we find it; and perhaps it may be worth a lot of money.'

Ralph shook his head incredulously. And yet it was possible. The ring might be there, and it might prove of great value. In misfortunes, the mind grasps at the smallest alleviations, and Ralph consoled himself in his depression by picturing the finding of a splendid ruby worth say ten thousand pounds. No more artillery-work then—no more India.

Gigglesham boasts of several churches, and St Crispin's lies in a hollow by the river, close to the bridge. A low squat tower and plain ugly nave. But in its nook there—the dark river flowing by, the sail of a barge shewing now and then, the tall piles of deals in the timber-yard beyond, the castle-keep frowning from the heights, and the big water-mill with its weirs and rapids, the noise of which and of the great churning wheel sounded slumbrously all day long—alked with these things, the old church had something homely and pleasant about it, hardly to be replaced by the finest modern Gothic.

Workmen were swarming about it now. The roof was nearly off. There were great piles of sand and mortar in the graveyard. Mr Martin, the plumber and glazier, who took the most lively interest in the underground work, even to the neglect of more profitable business, was on the lookout for Lieutenant Grant, and greeted him cheerily.

'We've got 'em all laid out in the vestry, Cap'n Grant, all the whole family; and now the question is, what are you going to have done with them? Would you like 'em put in the vaults below, where they'll all be done up in lime and plaster? or would you like 'em moved somewhere else—more in the open air, like?'

'The least expensive way, I should say,' replied Ralph grimly. Somehow or other his appreciation of his ancestors was deadened by this last stroke of fate in cutting him adrift from his succession. 'But look here, Martin,' he went on, taking the plumber aside; 'there is one of the coffins, Major Hammond's, I should like to have opened. It can be done?'

'Easy enough, sir,' cried Martin, who, to say the truth, was delighted at the prospect of a little charnel-house work. 'He's a lead 'un, he is. I'll have the top off in no time.'

Ralph looked gravely down at the last remains of the Hammonds. The wife, if she had been a wife, on whom their inheritance hung, was not here; she had died in India. But there was the Major's coffin, the wood-work decayed, but the leaden envelope as sound as ever.

Martin was quickly at work with his tools. The cover was stripped off, and for a moment the Major's features were to be seen much as they had been in life; then all dissolved into dust.

There was no ruby ring—that must have been a fable; but there was something glittering among the remains, and on taking it out, it proved to be a plain gold hoop.

'Well, that's worth a pound, that is,' cried the practical Martin, carefully polishing up the treasure-trove. It had probably been hung round the neck of the departed—a tall bony man—for the ring was a small one, and there were traces of a black ribbon attached to it.

It was a disappointment, no doubt; and yet somehow the sight of the ring had given Ralph a little hope. It was the wedding-ring, he said to himself, his great-grandmother's wedding-ring. The Major must have been fond of her to have had her ring always about him; and it had been buried with him. That had given rise to the story about the ruby. He drove home, after giving directions about the disposal of the coffins, feeling less sore at heart. He was now convinced that they had right on their side, and there was some comfort in that.

When he reached home, he shewed the ring to Maggie, who agreed with his conclusions.

'But there is something inside—some letters, I think,' she cried.

'It is only the Hall-mark,' said Ralph, having looked in his turn. 'But stop. That tells us something: it will give us a date.'

'How can that be?' asked Maggie.

'Because there is a different mark every year. See! you can make it out with a magnifying-glass. King George in a pigtail.'

The silversmith at Gigglesham turned up his tabulated list of Hall-marks, and told them at once the date of the ring—1760.

'But it might have been made a long time before it was first used,' suggested Maggie.

'True; but it could not have been used before it was made,' replied Ralph. 'It gives us a date approximately, at all events.'

At first, the knowledge of this date did not seem likely to be of much use to them. But it gave them the heart to go on and make further inquiries. Ralph threw himself into the task with fervour. He obtained leave to search the records of the Horse Guards; and ascertained at last where had been stationed the regiment that Richard Hammond then belonged to in that same year.

It was at Canterbury, as it happened; and that seemed significant, for it was not so far from there to his sweetheart's home at Milton. Ralph went over to Canterbury, and with the help of a clerk of Mr Smith's, searched all the parish registers between the two places; but found nothing.

The trial was coming on in a few weeks, and not a scrap of evidence could they get of the marriage of Major Hammond. The other side were full of confidence, and well they might be. Ralph had made up his mind to return home, and was walking disconsolately down the High Street of Canterbury one day when he saw over a shop-window the sign, 'PILGRIM, Goldsmith; established 1715.'

'I wonder,' he said to himself, 'if my great-grandfather bought his wedding-ring there?'

A sudden impulse sent him into the shop. A nice-looking old gentleman, with long white hair, was sitting behind the counter, peering into the works of a watch through an elongated eye-glass.

Ralph brought out his ring. 'Do you think this ring was bought at your shop?' he asked.

'How long ago?' asked Mr Pilgrim, taking up the ring and looking at it all round.

'About the year 1760.'

'Ah-h! I can't remember so long ago as that. It was in my father's time; but for all that, perhaps I can tell you.'

He took up the magnifying-glass, and examined the ring carefully once more.

'Yes,' he said, looking up, a mysterious expres-

sion on his face, 'that ring was bought from my father, I have no doubt.'

Ralph questioned him as to the sources of his knowledge; and Mr Pilgrim told him at last. It was his father's practice to put his private mark upon all the jewellery he sold. He could do it in those days, when his stock was small and all his own. In these times of changing fashions, when much of a jeweller's stock is on approval, this would be impossible.

Ralph listened to these explanations with breathless impatience. Had Mr Pilgrim any books belonging to his father which might possibly shew the sale? The old gentleman admitted that he had a lot of his father's old account-books up in a garret; but it would be very troublesome to get at them; and what would be the use?

'Why,' said Ralph, 'you might possibly make the happiness of two young people, who otherwise may be sundered all their lives.' He explained enough of the circumstances to shew the old gentleman that it was not an affair of mere idle curiosity; and after that he entered into the quest with ardour. Pilgrim his father had kept each year a sort of rough day-book, in which he entered transactions as they occurred, with occasional short annotations. And at last, after a long troublesome search, they found the book for the year 1760 and 1761. Nothing was to be made of the first; but in the second they had the delight of finding the following entry: '25 March, sold ring, young Master Hammond, two guineas saw y^e wedding afterwards at St Mary's, Faversham.'

That night all the church bells of Gigglesham were set a-ringing, for the news oozed out that Ralph Grant had come home with full proofs of the marriage that would make good his title to Westbury. For the young people were liked by everybody, whilst Boodles was generally execrated. Indeed the case never came on for trial, as Boodles withdrew the record when he found that there was full evidence to refute his claim. Ralph and Maggie were married soon afterwards; and the bride wore as a keeper over the golden circle her own special dower, the long-buried but happily recovered treasure, Major Hammond's ring.

LOST IN MAGELLAN'S STRAITS.

ONE might look all the world over without finding a coast more bleak, desolate, and inhospitable than that of Tierra del Fuego and the southern part of Patagonia. Owing to certain meteorological causes, the cold is comparatively greater in the southern than in the northern latitudes; icebergs are found ten degrees nearer to the equator. In the Straits of Magellan, which are about the same distance from the equator as Central England, the cold in winter is so intense as to be almost unbearable. Here icebergs are found floating, and glaciers larger in extent than any Switzerland can boast of; the land is entirely covered with snow down to the very water's edge, while bitter piercing winds rush down the clefts in the mountains, carrying everything before them, and even tearing up huge trees in their passage. Not a pleasant coast this on which to be cast away; and yet such, in 1867, was the fate of two unfortunate men who formed part of the crew of Her Majesty's ship *Chanticleer*, then on the Pacific station; and an

account of whose sufferings we propose to lay before our readers.

One day early in September a sailing-party had been sent off with the hope of increasing the ship's stock of provisions by the addition of fresh fish, which is here very abundant. The nets soon became so heavy that extra hands were required to haul them; and as there appeared even then little chance of the work being over before sunset, the fishing-party obtained permission to spend the night on shore. Tents were pitched, huge fires were lighted, with the double object of affording warmth and cooking some of the produce of their successful expedition; blankets were distributed, grog was served out, and altogether the party seemed prepared to defy the cold, shewing a disposition to be 'jolly' in spite of it that would have gladdened the soul of the immortal Mark Tapley. However, after all these preparations to keep off the effects of the biting frost, they were compelled about nine o'clock in the evening to send off to the ship for more blankets and provisions.

Two sailors, Henty and Riddles, volunteered to go on this errand in the 'dingy' (a small two-oared boat), and having obtained the desired things, they started to return; but when about midway between the ship and the shore, the wind began to rise, carrying the boat to some extent out of her course; shortly after which she struck on a sand-bank, and in trying to get her off one of the oars was lost. Soon they were drifted out into the strong current. It was now dark as pitch; the wind continued to rise; and although all through the night they made every possible effort to reach the shore, when morning dawned, to their alarm they found themselves miles away from the ship, and powerless to contend any longer with their one oar against the force of both wind and tide. They were finally driven on to the beach in a bay opposite Port Famine, a spot not less dreary than its name.

The sea was so rough, that here for a day and a night our two men were obliged to remain; and when on the second day they ventured to launch the boat, it was upset; nearly all their things were lost, and they were left to endure the intense cold without the means of making a fire, with no clothes but those they wore, and scarcely any food. For a while they walked about, trying, not very successfully, to keep up circulation; and by-and-by the feet of both began to swell and grow so painful that it was no longer possible to keep on their shoes. Still, although suffering both from hunger and cold (Henty's toes being already frost-bitten), they kept up their spirits in true British fashion, not for a minute doubting that sooner or later they would be picked up; and true enough, on the fourth day the *Chanticleer* was seen in the distance under weigh, and standing over towards them. Taking the most prominent position that could be found, they made signs and tried in every possible way to attract attention, but in vain. If they had only possessed some means of kindling a fire they might have succeeded; but although those on board were at the moment on the look-out for their lost mess-mates, no one saw them; and the hope with which the two poor fellows had buoyed themselves up, faded away as the ship changed her course, grew smaller and smaller, and by-and-by, late in the

afternoon, while they still watched, altogether disappeared.

Although now their only chance of rescue was apparently gone, and the last scrap of food was consumed, yet the brave fellows did not despair. Their boat was very leaky; but on the 5th of September, having repaired her as far as possible, they took advantage of finer weather to endeavour to reach some spot where there would be more probability of getting rescued by a passing ship; but they had scarcely got half-way across the Straits before there was a terrific snow-storm; it blew a gale; the boat began to fill rapidly; and finally they were blown back again into the bay, upset in the surf and nearly drowned, being unable to swim through having lost the use of their legs from sitting so long in water. However, they were thrown up by the waves high, though by no means dry, and in this miserable plight and under a pitiless snow-storm, they were forced to remain all through the night. The next day they managed to erect something in the form of a hut, in which they might lie down and be to some extent protected from the weather, which was so boisterous as to render it useless to attempt to launch the boat. For some days, owing to exposure and want of food, they were both very ill; but still hoping for better weather, they kept themselves alive by eating sea-weed and such shell-fish as could be found, until the 12th of September, when the weather suddenly clearing, they again launched their small boat; and this time, after a day's hard toil, succeeded in reaching the opposite side of the Straits, where they had left the ship, which it is needless to say was by this time far away.

When first the men were missed, rockets had been fired, and blue-lights burned; and on the following day the cutter was sent to the westward, while the *Chanticleer* coasted along the opposite side; look-out men were constantly aloft; but nothing was to be seen of the missing men. The next day the ship had remained at Port Famine, and exploring parties were sent in all directions. On the third day they again weighed anchor, and examined a fresh piece of coast, but all to no purpose; and finally it was decided, with much regret, to give up the search, for every one concluded that the poor men must by this time have perished, even if they had survived the first night's cold, which no one on board thought possible. Both men were generally popular, and great grief was felt for their loss. Immediately a subscription was started by the whole ship's company for the widow of the one man and the mother of the other. Strangely enough, when the sad news reached England, the former, in spite of what seemed conclusive evidence, firmly refused to believe the assurance of her husband's death. Whether the wife's intuition or the more logical inferences of every one else proved correct, events will shew.

By the time Henty and Riddles reached, as we have seen, the opposite side of the Straits it was quite dark; but on the following day they found that the current had drifted them fourteen miles from Port Famine, towards which they had steered, and for which place they now started on foot. Here they saw in the distance a ship under steam going towards the Pacific; but again all efforts to attract attention failed. They knew of no settle-

ment that they could hope to reach, and at this rough season there was not the slightest chance of falling in with any wandering tribes of natives. The only course left them was to endure the cold, wait as patiently as might be, in the hope of some ship passing within hail, and to keep up what little life remained in them by chewing sea-weed, and seeking and devouring the mussels, which fortunately were to be found in great abundance on the rocks. After a time, however, they grew so weak as to be only just able to crawl out of the place they had made to lie down in, and every day the effort to gather their scanty nourishment grew harder. Once more, on the 4th of October, they saw a vessel pass through the Straits, but were unable to make any signals; on the 7th, both men had grown too weak to stir, and nothing was left for them but to confront death. The 8th day passed, the 9th, the 10th, and they were still sinking slowly from starvation. On the 11th, when they could not possibly have lived more than a few hours longer, and had become little short of living skeletons, they were picked up by the officers of the *Shearwater*, and at once taken on board, where, after receiving the most careful attention, both, although still suffering greatly, began after a time to recover. Being conveyed by the *Shearwater* to Rio, they remained some time in the hospital there, and finally were sent home invalided; and yet both men lived to regain their full strength, and to serve as striking examples of what tough human nature can endure in the shape of physical hardships and mental anxiety. They had contrived, by a patience and energy almost unprecedented, to lengthen out existence for a space considerably over a month, with no other food than sea-weed and shell-fish; the last four days indeed eating absolutely nothing; while the whole time exposed to intense cold, the roughest weather, and more hardships than it is possible for those who have never seen that barren and desolate region even to imagine.

THE MONTH: • SCIENCE AND ARTS.

MR T. M. READE, in his presidential address to the Liverpool Geological Society, discussed the question of 'geological time,' and took as an approximate measure thereof the denuding effect of rain-water on the earth's surface. The most rainy districts in England are those in which the oldest rocks prevail; but the average annual rainfall, including Wales, may be taken at 32 inches. Assuming the area of the two to represent one river basin, the quantity of water discharged in a year would contain more than eight million tons of solid matters; and at this rate, 12,978 years would be required to lower the surface of the land one foot. Analyses of sea-water shew that there are in 100,000 tons, 48 tons of carbonate of lime and magnesia, and 1017 tons of sulphate of lime and magnesia; and the ocean contains enough of the first to cover the whole of the land with a layer fifteen feet thick; and of the second to make a layer 267 feet thick. Twenty-five million years would be required to accumulate the one, and 480,000 years the other. Again, the total surface of the globe is 197 million

square miles. A cubic mile of rock would weigh 10,903,552,000 tons; so that, as Mr Reade states, 'to cover the whole surface of the globe one mile deep with sediment from the land at the rate of 800 tons per square mile of land-surface, would take 52,647,052 years.'

Geologists have speculated over this question many years: it has now passed into the hands of mathematicians, without whose aid it will never be settled. The Rev. Dr Haughton, F.R.S., of Trinity College, Dublin, in a paper read before the Royal Society on the last evening of their session, 'On the probable age of the continent of Asia and Europe, and on the absolute measure of geological time,' says that the elevation of Asia and Europe from beneath the deep waters, separated the earth's axis of rotation from the axis of figure by 207 miles, which would produce a large amount of wobbling. At present, 'astronomers are agreed that the motion of the pole is secular and very slow, all traces of wobbling having disappeared.' Then after a series of mathematical demonstrations, the doctor continues: 'The geological age of the continent of Asia and Europe is well marked by the horizon of the Nummulitic Limestones,' which extend from the Mediterranean to Japan. 'These rocks make up the backbone of the great continent, and at its formation were raised from deep water to form the highest chains of mountains in the globe. Geologically speaking, they are modern, belonging to the Lower Tertiary Period. My calculations assign to the Nummulitic Epoch a date not less than 4157 millions of years ago. No practical geologist will feel any surprise at this result.'

In a paper read at the last meeting of the Geological Society, Mr Belt discussed various geological questions, and shewed reasons for believing that in the far remote ages, the north of Europe was covered by a great lake. 'The formation of this lake was due,' he remarked, 'to the ice of the glacial period flowing down the beds of the Atlantic and Pacific, and damming back the drainage of the continents as far as it extended. To the rising of these waters must be ascribed the destruction of palæolithic man, the mammoth, and the woolly rhinoceros. This lake was once suddenly and torrentially discharged through the breaking away of the Atlantic ice-dam, but was formed again and ultimately drained by the cutting through of the channel of the Bosphorus.' It is perhaps well to remark that these views are not as yet implicitly accepted.

In the Eocene deposits of New Mexico a fossil bone of a gigantic bird has been found, which, according to the description, had 'feet twice the bulk of those of the ostrich.' This discovery proves that huge birds formed part of the primeval fauna of North America, and that they were not confined exclusively to the southern hemisphere.

Professor Kirkwood states, in a paper on the relative ages of the sun and certain fixed stars read to the American Philosophical Society, that the history of the solar system is comprised within

twenty or thirty millions of years; that our solar system is more advanced in its history than the constellation of the Centaur, and that the companion of Sirius appears to have reached a stage of greater maturity than the sun, while the contrary seems to be true in regard to the principal star.

The annual report on the great trigonometrical survey of India contains particulars which shew that surveying in India is by no means holiday pastime. Colonel Montgomerie, who has just retired after twenty-five years' service, was engaged during nine of those years in a survey of the dominions of the Maharaja of Kashmir, comprising about 77,000 square miles. Within this extensive area rise stupendous mountain ranges and peaks, the highest of which is more than 28,000 feet, and the Indus, Jhelum, Kishanganga, and other great rivers, flow through the valleys. To fix the position of heights and places in such a country requires a combination of courage, skill, and endurance rarely to be met with, but which happily for geographical science has been forthcoming ever since the Indian survey was commenced. The annual reports contain many accounts of adventurous journeys, and hazardous exploits which few readers would think of looking for among the dry details of a scientific triangulation. Sometimes on resuming work after the rainy season, the 'rays' or lanes which had been cut through the forest to clear a way for taking distant sights, would be found so choked by the shoots from tree-stumps and young bamboos which had grown to an 'astounding height,' that more than thirty miles of such rays had to be cleared over again before the work could proceed. On extending the survey into Burmah it was only by cutting tracks through the dense forest that communications could be effected from station to station, and whenever an existing road could be made available it was regarded as a luxury. At Kamakabo it became necessary to carry the great theodolite to the top of a rocky hill: the sharp projecting rocks 'jutting out in every direction,' and as they could not be removed, ladders were stretched from rock to rock, and thus a most perilous ascent and descent was accomplished. The labour and risk may be judged of from the fact that the theodolite weighed more than six hundred pounds, and we can appreciate the satisfaction with which the observer wrote in his journal, 'it was a day of rejoicing when the instrument was brought down in safety.' At times a region of sand-hills was traversed where vision was not obstructed, but where not more than three wells of drinkable water were found in a distance of seventy miles. And once the observer waded through a mile of mud and water under a burning sun to an old lighthouse whence it was essential to take angles to fix the position of the new one five miles distant. A consequence of this exploit was an attack of malarious fever.

It seems likely that trigonometrical surveying may be carried on with less difficulty in future; for an Italian officer of engineers, Lieutenant Manzoni, has proved that the triangulations can be photographed. It is possible to construct a camera geometrically arranged, and if the rays of light converging from distant points of view are intercepted, and marked on a diaphragm, it is evident that the angular readings obtained to such points would be identical in their bearings with the

objects themselves. By such a camera, negative views of inaccessible ground can be faithfully taken, and the angles can be either plotted or calculated. Photography thus offers itself as a means whereby a difficult mountain country can be surveyed without risk, while for purposes of military reconnaissance its advantages are obvious.

For some time past attention has been directed towards steel-wire cables; and experiments recently made in Portsmouth Dockyard have clearly demonstrated their superiority over hemp and iron. Steel, as is well known, is more and more used in the building of ships, and, because of its tenacity and lightness, in their rigging; and now it seems likely to supersede the unwieldy hawsers and chain cables everywhere in use. With a chain the safety of the ship depends on the weakest welding; and when a single link parts, either from inherent defect or from a sudden jerk, everything parts, and the vessel drifts. A wire cable, on the contrary, gives notice, so to speak, of an approach to the breaking point. First one strand, then another, gives way, and still the cable holds, and it may happen that it will hold long enough to save the ship. Now that experiment has proved that a steel-wire cable is as flexible as the best hemp, that it is three times as strong, and does not cost more, the change from one to the other may be made with confidence. Another advantage is the lightness, for by making use of steel, about two-thirds of the usual weight of the cable is got rid of. Evidence of the strength is seen in the fact that a three-inch steel hawser did not break until the strain exceeded twenty-two tons, and that a strain of more than a hundred tons was required to break the six-inch.

Lieutenant Totten of the United States Army, in writing about explosives and big guns, discusses carefully the question as to the best kind of explosive for actual service; that which will expend its entire force in driving out the projectile. With the large-grained gunpowder now in use about half of the charge is wasted, while gun-cotton and dynamite exert an injurious strain upon the gun. As a way out of the difficulty, he recommends a 'compensating powder,' each grain of which contains a core of gun-cotton, and he points out that forty pounds of this powder would be sixty pounds stronger than a hundred-pound charge of gunpowder. The explanation is that by the time forty pounds of the hundred are burned, the shot has left the gun; consequently, sixty pounds are of no help to the shot. But if the forty pounds contain fifteen pounds of gun-cotton, then this cotton, when fired, acts on the already moving shot under the most favourable circumstances as a pure accelerator, and does not injure the gun. In this way, writes Lieutenant Totten, 'we eliminate the great waste of the one, curb the straining action of both, and obtain a true artillery powder, lighter, and four and a half times more effective, charge for charge, than our best gunpowder.'

An address 'On Light in some of its Relations to Disease,' delivered to the Albany Institute (State of New York) by Dr Stevens, sets forth views and facts which are worth consideration. Light, as we know, is on the whole beneficial; but may there not be cases in which it is harmful when passing through the transparent media of the human eye? Dr Stevens is clearly of opinion that many nervous diseases are aggravated if not pro-

duced by defective vision. The strain on the muscles of the eye, when long continued, sets up an irritability which tells injuriously on the nervous system, and neuralgic affections. St Vitus's dance and severe periodical headaches are the consequence. Rectify the imperfection of the sight, says Dr Stevens, by proper spectacles, and the nervous disease will be either mitigated or cured. It is of no use to buy glasses at hazard because they seem to suit the eye; for none but a scientific oculist can really decide, after careful experiment, on what is proper. In many cases the focus of the two eyes is not the same, and each must have its proper glass. Professor Donders of Utrecht was the first to point out that the so-called 'cylindrical glasses' were generally the most efficient; and since then 'the science of correcting anomalous refractions of the eye has been brought to a perfection which is truly wonderful.'

Dr Poumeau of Guadeloupe has published a series of tables, based on the changes of the moon, by which, as he believes, it is possible to tell the sex of a child before birth. He intends to draw up similar tables for the use of horse and cattle breeders; and if any one should test his calculations by observation, the doctor would like to be informed of the result.

The *Journal* of the Chemical Society contains an account by Mr Hight, of the Indian Forest Department, of experiments made with a view to ascertain the practical nature of a proposed method of determining the mineral strength of soils by means of water-culture. It is explained that the usual object of water-culture experiments is to find what particular salts are congenial or necessary to the growth of any particular plant. When a plant is grown in an artificially prepared solution, so that it can obtain its nourishment solely from the salts contained in that solution, the exact effect of any salt upon the growth of the plant can be easily observed by adding that salt to, or abstracting it from the solution. In carrying out this method, specimens of soil were taken from five different forests in India; solutions of these specimens were made; seedlings of *Acacia arabica* were, with proper precautions, placed in each, and the results of growth, such as increase in weight, number of leaves, and length of roots, were carefully noted. These results are published in a numerical table, and allowing for the difficulties of a preliminary experiment, may be regarded as satisfactory.

The question is frequently asked—Why is there no School of Forestry in England, while in almost all other countries of Europe schools of forest science are either established by the government, or are associated with a university or a polytechnic institution? Sir Joseph Hooker, President of the Royal Society, and Director of the Royal Gardens, Kew, says in one of his reports, that the subject is so neglected in this country, that when our government are in want of a forest inspector for India, they have first to send him to France or Germany to learn the theory and practice of taking care of a forest. On the continent, as Sir Joseph remarks, 'forestry holds a distinguished place among the branches of a liberal education. In the estimation of an average Briton, forests are of infinitely less importance than the game they shelter, and it is not long since the wanton destruction of a fine young tree was considered a venial offence compared with the snaring of a pheasant or rabbit.

Wherever the English rule extends, with the exception of India, the same apathy, or at least inaction, prevails. In South Africa, according to the colonial botanist's report, millions of acres have been made desert, and more are being made desert annually, through the destruction of the indigenous forests; in Demarara the useful timber trees have all been removed from accessible regions, and no care or thought is given to planting others; from Trinidad we have the same story; in New Zealand there is not now a good Kauri pine to be found near the coast, and I believe that the annals of almost every English colony would repeat the tale of wilful wanton waste and improvidence. On the other hand in France, Germany, Switzerland, Austria, and Russia, the forests and waste lands are the subjects of devoted attention on the part of the government, and colleges, provided with a complete staff of accomplished professors, train youths of good birth and education to the duties of state foresters. Nor, in the case of France, is this practice confined to the mother country: the Algerian forests are worked with scrupulous solicitude, and the collections of vegetable produce from the French colonies in the permanent museum at Paris contain specimens which abundantly testify that their forests are all diligently explored.

This is a long quotation; but it is justified by the importance of the subject, and it is quite clear that we cannot go on much longer without a School of Forestry. Diligent students can hardly fail to be forthcoming, and when once they shall have proved themselves efficient inspectors, the question of 'good' birth may be left to take care of itself.

THE DESERTED GARDEN.

Beyond the woods, yet half by woods inclosed,
A tangled wilderness of fair growth lay;
A spot where dreaming poet might have doted
Into the dawning of a fairy day;
For in its desolation wild reposed
Something that pointed to a past more gay,
Since here and there one found the lingering trace
Of careless hands in the neglected place.

The once trim walks were coated thick with moss;
Dwarfed were the garden roses, and their glow
From vivid crimson paled to fainter gloss
Nigh broken sun-dial; and the water's flow
Had ceased to murmur in the ancient foss,
Whose slopes were now with purple thyme a-blow;
And on the fragments of the crumbled wall
The golden wall-flower stood like seneschal.

The nut-trees made an archway overgrown,
And midst the boughs the timid squirrel leapt;
At eve the nightingale with mellow tone
Sang with the mourning wind a dirge that crept
Into all hearts—until one heart more lone
Than others, gathered up the strain and wept;
Nor knew if 'twere half joy or wholly grief
That in the sympathetic chord had found relief.

The clouds sent flickering shadows o'er the grass,
As though some spectral life were there upstirred;
And as the fitful breeze onward pass,
A murmur of strange voices might be heard,
As though some unseen quire were chanting mass,
Echoed throughout the grove by plaintive bird;
And still the wanderer listening, asks for whom
The wild Amen!—For whom the flowers did bloom?

The ancient summer-house with broken vane,
And rotting pillars where the woodbines twine;
And on a cobwebbed solitary pane
In casement, that with colours once did shine,
And showed the seasons through each differing stain,
Was writ in jagged-wise a Latin line,
'*Sic transit gloria mundi*;' and below,
'My Ursula! the world is full of woe.'

It read as epitaph above the grave
Of human hopes, all blighted as the space
Around, whose wreck no hand was stretched to save;
Yet that with tender melancholy grace,
A sermon in that blooming desert gave
To him whose soul had power enough to trace
In the lone scene, so desolate, so lone,
Though man upbuilds, God shapes the crowning stone.

I spake the name a score of times aloud,
'Sweet Ursula,' a source of joy and woe!
The glory of a life, the light allowed
To make all nature flush with deeper glow.
Then light put out—then darkness—then a cloud
And agony that nought but love can know—
The bitter memory of a sweetness past,
A gleam of sunshine all too bright to last.

The lazy lilies gleamed with petals white
Upon the pool o'errun with weeds and sedges,
That once shone clear and fair as mirror bright,
With blue forget-me-nots on shelving ledges,
Where water-flags appeared their banners light,
And the marsh-mallow crept along its edges—
But in the water face to face no more
Smiled back as in the happier days of yore.

Ah! could the olden stones a story tell,
How sweet a love-tale might they not reveal
Of mystic Ursula, and what befell
In the fond hopes and doubts that lovers feel,
Till blighted by that sorrowful farewell
That all the beauty of the world did steal;
Shattered the rainbow in fresh gathered cloud,
And changed the bridal robe to funeral shroud.

Perchance her monument this wildered spot,
Tended by Nature's pitying hand alone,
For one by generations now forgot,
To whom he reared no proud sepulchral stone;
But with love's jealousy he willed that not
Another o'er her grave should make his moan—
But he alone through hieroglyphic bloom,
Should haunt the precincts of the loved one's tomb.

Ay, who can tell! For Time his seal hath set
On life and all its secrets gone before;
The hearts are dead that never could forget;
The hearts that live, but know the tale no more.
Each hath its bitterness o'er which to fret,
Each hath its joys eclipsing those of yore;
To each its own small world the real seems,
Outside of which is but a land of dreams.

Yet still one loves to linger here and muse,
And conjure up vague theories of the past;
And here a hand to trace; and there to lose
The touch of human life upon it cast;
And still for idle loitering make excuse,
And weave a tale of mystery to the last;
And in the old deserted garden bowers
Find fairer blossoms than 'mongst tended flowers.

A WORD ON RICH FOLKS.

WE have never quite understood why among preachers and moralists there should be such a sweeping denunciation of riches. The rich man is called all that is bad. The poor man—no matter that he had been a spendthrift—is prescriptively an ill-used saint, for whom not enough can be done. The older notions on the subject perhaps originated in the fact that riches were too frequently accumulated by robbery and oppression; which is not unlikely, for until this day in certain eastern countries, of which Turkey is a luminous example, riches are usually a result of some sort of extortion, if not actual violence. And if so, we need not wonder that the poor were reckoned among the oppressed and specially worthy of compassion.

However the ancient opinions regarding riches originated, it is surely full time that new and more rational views were entertained, or at least professed, on the subject. In Western Europe, men do not now go about plundering and oppressing by armed force, as in the days of old. The poorest are protected by the law. As a general rule, riches are accumulated by a course of patient industry, and the reputedly wealthy are among the most careful in setting the example of doing good. Of course our mixed state of society is not without instances of wealth being realised by jobbery, by fraudulent exploits among speculators. But these are exceptions which a wise man does not fasten upon, except to point the moral, that ill-gotten riches seldom last long, and that their possessors are anything but respected. Why then persist in holding up the wealthy to reprobation? The truth is, the cry is little better than a sham. The very preachers who talk reproachfully and warningly of riches, seldom fail to be as zealous in the pursuit of riches as their neighbours. And in this no one can rationally blame them. Every man within his proper calling is entitled as a matter of duty to himself and those dependent on him to use all legitimate means for bettering his condition, and, if possible, increasing in wealth.

It is indeed only by the prudential exercise of these privileges that society is held together and advanced in civilisation. It is very pleasant to see honest poverty decently struggling with circumstances, and maintaining a good character amidst adversity; but we deny altogether that poverty alone is synonymous with virtue, and to be held up as meritorious. Without riches even comparatively small, little good can be done. Wealth—meaning by that a surplus of gains beyond what are required for daily subsistence—is obviously the source of universal comfort. Money is above all things potential. It hires labour, gives the employment which so many stand in need of. It sets up manufactories, organises railways, puts ships on the ocean, pays for machinery, builds and improves towns, schools, and churches, encourages learning, enlarges processes of husbandry with a view to ever-increasing demands for food. The most skilful and willing workman, when placed in a country without money wherewith to employ him, is as helpless in the attempt to realise the wages of labour as the merest savage. In short, it is clear that before work can be given, there must in some measure be an accumulation of capital, or in plain language savings, in the hands of a part of the community.

Such being the case, how absurd does it seem to disparage money, as if it were something sinful and dangerous. As well disparage man-power, horse-power, steam-power, or any other power. As a force, money is neither hurtful nor beneficial, neither bad nor good in itself. All depends on the way in which it is used or directed. Gunpowder can blast a quarry and bring forth stones with which a hospital may be built; but the same gunpowder in the hands of the Russians or Turks can blow thousands of men into eternity in a single day. A rich man, if he be unselfish, has in his wealth the power of making his fellow-creatures less coarse, less depraved, and as a consequence, less miserable. From the vantage-ground of high position he can fight a chivalrous battle for the afflicted and him that hath no helper. His good example will have far more effect than that of a

poorer man. His influence, if directed to good and merciful objects, is as powerful for good as that of the selfish rich man is for the reverse. 'Nobody should be rich,' said Goethe, 'but those who understand it.' But when a man owns gracefully and usefully, what good may he not do in the way of opening a path for others, and giving them access to whatever civilising agencies he may himself possess! Therefore we can understand how both religion and philanthropy may treat with respect and even with reverence the motto, 'Put money in thy purse.' May we not even say that it is the desire to 'get on' and to become rich that prevents our sinking into barbarism?

'There is always a reason in the man,' says Emerson, 'for his good or bad fortune, and so in making money.' This rule is not without exceptions, for now and then people do become rich by lucky or even by dishonest 'hits;' nevertheless money is in the main representative. Shew me a man who has made fifty thousand pounds, and I will shew you in that man an equivalent of energy, attention to detail, trustworthiness, punctuality, professional knowledge, good address, common-sense, and other marketable qualities. The farmer respects his yellow sovereign not unnaturally, for it declares with all the solemnity of a sealed and stamped document that for a certain length of time he rose at six o'clock each morning to oversee his labourers, that he patiently waited upon seasonable weather, that he understood buying and selling. To the medical man, his fee serves as a medal to indicate that he was brave enough to face small-pox and other infectious diseases, and his self-respect is fostered thereby. The barrister's brief is marked with the price of his legal knowledge, of his eloquence, or of his brave endurance during a period of hope-deferred brieflessness.

But besides its usefulness and its being the representative of sterling qualities, the golden smile of Dame Fortune is to be sought for the invaluable privilege of being independent, or at least being out of the horrid incumbrance of indebtedness. A man in debt is so far a slave; while it is comparatively easy for one possessed of ten thousand per annum to be true to his word, to be a man of honour, to have the courage of his opinions. When a man or woman is driven to the wall, the chances of goodness surviving self-respect and the loss of public esteem are frightfully diminished. But while striving to escape from the physical suffering and the mental and moral disadvantages that attend the lot of poverty, we should admit to ourselves the fact, that there are hardly less disadvantages and temptations ready to make us miserable, if we are not on our guard after attaining to a reasonable amount of wealth.

In a meeting assembled to make arrangements for Mr Moody's last preaching campaign in London, one of the speakers expressed his hope that Mr Moody would 'do something for the miserable poor of London.' 'I shall try and do so,' was the preacher's reply; 'and I hope also to be able to

do something for the miserable rich.' 'The miserable rich!' Some would think the expression almost a contradiction in terms, but it is not; for the rich, while possessing the means, as we have already said, of doing vast good, have nevertheless many things to render them unhappy.

Great wealth is a heavy burden; the life of a rich peer being described as 'madc like the life of an attorney by the extent of his affairs.' Even their most cherished means of enjoyment may become the possibilities of vexation to the rich. Some may think it is a fine thing to be a landlord, but there is hardly any position more irksome. There is no end of trouble with tenants. The same thing with servants. People who have many servants are sometimes worse served than those who have only one; for what is every one's business is nobody's, and each individual servant is ready with the answer: 'Oh, that is not in my department,' when asked to do anything. The more valuable is your horse, the greater is your anxiety about his knees. It is proverbially difficult for a lady to be 'mistress of herself though china fall;' but if the sound of broken *delf* rise from the kitchen, 'Another plate' is her indifferent remark. The fact is, every new possession becomes an additional something to be looked after, and adds almost as much to our anxiety as it does to our comfort. There is sound philosophy in the answer a king is related to have given to one of his stable-boys, when meeting him one morning he asked him: 'Well, boy, what do you do? What do they pay you?' 'I help in the stable,' replied the lad; 'but I have nothing except victuals and clothes.' 'Be content,' replied the king; 'I have no more.'

Occasionally there cast up in our social circle rich folks in an unhappy state of cynicism. They are at a loss what to do with their money. In making their will they demonstrate all sorts of whimsicalities, passing over any recognition of their oldest and most deserving friends, and leaving their means in some odd fashion which everybody laughs at. In such instances it is curious to note the anguish they experience in being asked to assist in charitable contributions. In Dr Guthrie's Autobiography there is a good illustration of this unhappy state of cynicism into which the rich are prone to fall. There he relates how, in a winter of extraordinary severity, he made an appeal to a lady who had succeeded to a prodigious fortune, on behalf of the starving poor of his parish. In doing so he had no very sanguine hope of success. On being ushered into her room, she turned round, and shewing her thin spare figure, and a face that looked as if it had been cut out of mahogany, grinned and said: 'I am sorry to see ye. What do you want? I suppose you are here seeking siller?' 'The very thing I have come for,' was the Doctor's frank reply. Her next remark demonstrated how little power her riches had of conferring happiness; and with all her wealth of flatterers, what a poor,

lonely, desolate, miserable creature this possessor of more than a million sterling was. 'Ah!' she said, 'there is nobody comes to see me or seek me; but it's money, the money they are after.' We are glad to be able to relate that this miserably rich old lady gave to Dr Guthrie fifty pounds for the poor—an act which we hope shed a gleam of sunshine into her dark life.

It comes pretty much to this, that with riches there are sundry drawbacks, and that rich people are sometimes as much to be pitied as envied. All know the sharp penalties exacted by nature from those whose only business in life is the pursuit of merely personal gratifications. Wealth gives importance and satisfaction only in proportion to its being administered to a useful purpose. Unhappily, as has been said, there are miserable rich; but their misery is due to themselves. They have failed to see the vast capacities for doing good with which they have been charged. A wealthy person who spends the bulk of his time in the cruelties of pigeon-shooting, or in some other 'sport' connected with the coarse, wholesale destruction of innocent creatures, can be called neither a great nor a good man. At best, we can estimate him as an accomplished gamekeeper.

Luckily, and influenced by the wide expansion of modern ideas, the rich, in the main, rise above paltry gratifications. There is obviously an immense outgrowth in the generous distribution of wealth. In innumerable cases, the rich have a difficulty in determining how to expend their money in a way that will prove beneficial. The question, 'To whom or to what cause shall I contribute money?' must be a very anxious one to conscientious men of wealth. 'How are we to measure,' we may suppose rich men to ask, 'the relative utility of charities? And then political economists are down upon us if by mistake we help those who might have helped themselves. It is easy to talk against our extravagance; tell us rather how to spend our money as becomes Christians;' that is to say, for the greatest good of the greatest number. The fact is, riches must now be considered by all good men as a distinct profession, with responsibilities no less onerous than those of other professions. And this very difficult business ought to be learned by studying social science, and otherwise with as much care as the professions of divinity, law, and medicine are learned. Were the rich in this way to accept and prepare themselves for the duties of their high calling, no one would grumble, because in the nature of things money tends continually to fall into the hands of a few large capitalists.

The value of riches, then, depends on the use that is made of them. No doubt, as hinted at, they are often abused by the thoughtless, the dissolute. But look at the many grand results of properly employed wealth! Consider what is daily being effected in our own country alone by the beneficence of wealthy individuals. What number of charities supported, what churches built, what schools set on foot, what vast enterprises of a useful kind entered into for the general benefit of

society. On these considerations, what a farce is that silly declamation against the possession of riches, in which certain orders of persons are indiscreetly pleased to indulge!

FROM DAWN TO SUNSET.

BY 'ALASTER GREY.'

IN THREE PARTS.—PART II.

CHAPTER THE NINTH.

THE morning after Kingston's arrival and after their early breakfast, Deborah followed her father into his 'den'; he was already equipped for riding, and was drawing on his gloves.

'Late hours suit thee not, Deb; thou'rt looking pale, my Rose.'

'I am well enow. But father, I don't want you to take yourself away to-day; it seems unmannerly to Kingston. He will not care for my dull company alone. Do stay, my father!' She put her arms round his neck.

'Why, this is a new request! Thou'rt safe from all lovers while King is with thee. Pshaw! little one, I must go; I have pressing business. King will be proud to bear thee company. He raves about thee. Take him to the vicarage, or to ride.'

'No. Stay, father.'

'Sweet heart, I cannot. Ye look scared. I will send King away, and have Mistress Dinnage sent to ye. Ye're not well.'

'Indeed I am. Well, go, father; I will ask ye no more. Nay; I am all right; but it grieved me for Kingston.'

Sir Vincent laughed. 'Grieve not for him.'

And so Deborah and Kingston Fleming found themselves alone, for Mistress Dinnage, though urgently pressed by Deborah, was too proud to bear them company.

Deborah put a brave careless face on the matter. 'What will ye do, King?' she asked. 'I am going out for flowers. It is too hot to ride till evening. Will ye go your ways till dinner, or will ye be a carpet-knight, or what?' Truly, there was as much repulsion as invitation in Deborah's question, as she stood looking up, with her hat tied down and her basket on her arm; and though at that moment there was no vestige of coquetry in her manner, that upturned face could not look but lovely.

Kingston, half smiling, half mortified, answered: 'Well, I thought o' no other plan but to bide with you, Deb; but if ye are anxious to be rid o' me, I am off.'

'Nay!' Deborah laid her hand upon his arm, all penitent. 'Come with me. I will not deign to answer your insinuation. I will shew ye all the old haunts; the green paths where we played and romped, King, in the good old days.'

'Ye speak like a grandmother,' said Kingston, as they went down the long gallery together. 'The good old days! And what are these? You are a child as yet. I truly have cares and troubles.'

'You have not!' Deborah gazed up at him with her clear eyes, reproachful, yet laughing. 'Everything comes to your hand,' said she: 'work, travel, honours, a ladye-love. Ye have all that life can offer, and yet are not content.'

'Content? No; I am not.' Kingston stopped, and gazed at the 'Mistress Mary Flemyng' whose picture hung above them. 'Here is our ancestress, Deb, the "beautiful Mary Flemyng." She resembles

you. The same eyes, the same trick o' the eyelids, the same mocking, witching smile. Here she is, but seventeen, unwed still, but her fate is hanging over her. At eighteen, she was married to an old rich rake. She went mad in time, and they tell us, "died young;" the best thing she could do. Why, she had better have kept her name of Fleming, for she had a sad life of it. But she had a soft, tame, yielding nature; there was excuse for her. The Fleming fortunes too were at a perilous low ebb; and it is needful ever and anon to sacrifice a bud off the parent stem to mend the fortunes of the house. That was arranged. What is the worth of beauty but to win gold? Thy beauty, poor Mary Fleming, won a fortune; thy sweetness and worth were sold to the highest bidder! It was for thy kindred's sake. Truly, it was a noble act!

'Who told you this?' asked Deborah, gazing gravely up at her beautiful ancestress with a heightened colour and intense interest. 'I never heard the tale. O yes; surely I heard it long long ago, and thought it was a wicked act of hers. For had she not another lover—one that she really loved, young and noble?'

Kingston laughed cynically. 'O yes, but poor. What was that? A victim more or less never mattered. There were a dozen went to the dogs for her. She looks like it—doesn't she? That invincible spirit of coquetry could never have been quenched: it lurks in her eyes, on her lips. She deserved her fate.'

'Kingston, you are hard and cruel. Success has not sweetened you. I respect poor Mary Fleming.'

'Because *you* would have done likewise?' he asked, gazing down into her eyes fiercely and sardonically.

Half angered, she turned away, yet with a smile that was full of tender trouble, tenderness sweet and strange. Kingston brooded over that smile, and liked it not. That smile would seem to shew that Deborah had a lover. Who was Deborah's favoured lover? Kingston even remembered the daisy long ago. They had not another word to say till they reached the garden. There lay the quaint flower-borders, smelling of a thousand sweets, where bees and butterflies made up the jewels, and many a darting dragon-fly. And away in the background stretched cool and deep green woods, and a green path of tender shade, where stood a rustic seat. Oh, such a seat for lovers! And the tall bright foxglove reared its dappled bells about the gloom. Kingston's dreaming eyes took all in unconsciously, while Deborah cut and piled up a blooming heap of flowers.

'Now we have done,' she said. 'I must go and arrange them. Mistress Dinnage arranges beautifully.'

'Don't go in, Deb; the sun thaws me. I am cold. Feel my hand. I thought I was to be shewn the "old haunts?"'

Deborah blushed. 'O yes,' she answered hurriedly, avoiding his eyes again. 'The flowers must die, then, King.'

'Let them! A thousand flowers have had their reign at Enderby in these two years, and millions more will bloom and die before I see Enderby again!' He spoke hurriedly, emphatically.

Deborah gazing up at him, turned pale. 'What! are you going to die, King?'

'Nay, Deb, sweet heart; I can come here no more. Ask me not *why*. I can tell you—nothing.'

'Oh, I like not to hear you talk like this, King. You had a bright gay spirit once. I live in an atmosphere where, it is true, all is bright and beautiful and home-like, and but too dear! Yet I feel it is volcanic land; and beneath our feet, King, I hear the thunder-mutterings; and above our heads, King, it seems to me there often rise clouds black as night; for ye know how it is with us. But to your coming I looked for comfort. In father's and Charlie's faces I often find paleness, apprehension, gloom, through all their looks of love for me; and a foreboding chills my heart. But *you* were never wont to be like this. Now it seems to me your looks portend just such gloom and mystery. Ye are sad; you are not yourself. What ails you? Is there no lasting sunshine in life?'

'Not in yours, Deb, unless matters take another turn with you. Things are dark with your father, my little one. He has told me much. For one thing, I thank God, Deborah, that you have refused the Lincoln bait they tempt you with. Listen to no one who may lure you to such utter ruin. I know that man now. You were better dead than Mistress Sinclair.'

'No fear of that.—But shall we indeed be ruined, Kingston?'

'Things look dark. Could ye bear to lose Enderby, Deb?'

'Lose Enderby!' Her paling lips shewed that the girl had never contemplated that. 'Nay; I know not how to bear it. Is it sure?'

'No; but I thought it best to prepare you for any emergency. Heaven grant you may have some one to take care of you in this uncertain future!'

'I have a father and brother,' exclaimed Deborah proudly.

Kingston laughed with some bitterness. 'Ay, you have.'

'Have ye aught to say against them?'

Kingston glanced with his old railery at the flushed cheeks and flashing eyes. 'I dare not say it, if I had. Yet I wish I could get hold of that fellow Charlie; I might bring him to reason, if I could find him out.'

'He will come when he knows that you are here.'

Kingston doubted this in his own mind.

'Dear old Enderby!' muttered Kingston, as they strolled up the winding woodland path. 'With no home of my own, here I have always found one. It is *our* home, Deb. Can we leave it? Can we? I never thought it was so dear till now.'

Deborah did not answer. Her breast was heaving tumultuously. He saw that she was weeping silently and bitterly. She sat down on the shrubby seat, and Kingston walked slowly on. He soon returned, guessing rightly that Mistress Fleming would be proudly herself again.

Deborah and Kingston saw not much more of each other that day till they rode together in the evening. It happened that Mistress Dinnage stood by her father's side and watched them.

'They make a pretty couple,' said old Jordan through his smoke. 'He's more her match than Master Sinclair. 'Twould be a sin and shame to give pretty Lady Deb to *him*. Why, Master Charlie would run him through first!'

'That he would; and so would she, father, bless ye! Ye don't yet know our Lady Deb, if

you think such a thought. See him go out through this gate, father, times on time, the old sharp fox! his eyes glowering, as he could murder me. He has caught it *then*; and I have well-nigh laughed in his face. I hate the cunning bad old man, with his tall hectoring air. I wish Master Charlie would horsewhip him soundly.'

Old Jordan chuckled over his pipe, glorying in the spirit of Mistress Dinnage. 'Ay, ay; I wish he would, Meg. Young giant! Many's the time I've hosswhipped he. He'd laugh in my face for my pains now.'

That night the two girls were in their favourite walk, under Sir Vincent and Kingston were indoors.

'I shall owe you a grudge, Mistress Dinnage.'

'Why?'

'For leaving me all day with my cousin Kingston.'

'I would have ye be together!'

'This is not like you. Can it end but in misery? Oh, the Fates send him soon away from Enderby! Meg, he likes me well—far better than he did formerly; but oh, man-like, he would fain get the better o' my heart by fair fair words.'

'And why?' cried Mistress Dinnage impetuously. 'To hold and cherish it! What is this Mistress Blancheflower? (Can she compare with thee? Would he linger here?—

'Hush, hush! He is betrothed. When he weds, thou and I will run away and hide till it is all gone by. My heart will not break, sweet; do not think it. I am too proud.'

They wrung hands; and Mistress Dinnage sped away like a deer, for King Fleming's tall figure emerged from the garden-door in the wall.

'Plotting, plotting!' he said. 'My pretty conspirators! I wish I had caught you in it. That was Mistress Dinnage. I know her pace. How is it that the pretty lassie is not wedded out o' harm's way?'

'Because Mistress Dinnage only weds for love.'

'So she lives to do mischief. O Deb! look, there was the daisy-scene! There lay you, and there stood I. Deb, I would give up all the good o' my years of toil to be a boy again!'

The blush had not faded from Deborah's face when he looked at her. 'We all feel that,' she responded. 'How you did tease me, King!'

He smiled. 'I should love to tease thee now, if I had ease of mind. Give me your hand, Deb. Now climb, and gather that rose, and give it me with a gracious grace, as I saw you give to another.'

'I never climbed, though. Will *this* not content you, Master Fleming?'

'Nay, the highest, the highest! the "Rose of Enderby." I was blind, I was stone-blind! I never cared for roses; the taste comes too late. A student's life kills joy, and men grow blind in burrowing in books.'

'Well, there! Can your old blind eyes see that? I will fasten it in your coat.—Nay, you shall not, Kingston Fleming!' Deborah started back, with all her fiery soul blazing in her eyes, for Kingston would fain have drawn her to him and thanked her with a kiss. She plucked the rose to atoms and scattered it in the night air. 'Some maidens might think this cousinly of you; not I. I will not abide this familiarity.'

His face looked pale and changed in the moonlight. 'Have I offended you, Deborah? Can I

not even be your brother—for love of the olden time? Nay, see me! Look on me, Deb; I have need of pity. Do ye not see I am in trouble?'

All the girl's passion vanished; she drew near and laid her hands in his; she felt those strong hands trembling like leaves in the wind.

'In trouble, King?' she asked tenderly and piteously, with her sweet face upturned. 'Ye are ever hinting this; yet never win the courage to tell me where this trouble lies. Trust Deborah Fleming! She is the receiver of troubles; she is used to them. Deborah Fleming can prove a truer sister to you, perchance, than by idle words and caresses.'

But the strangely sensitive and impassioned nature of Kingston Fleming was all stirred and tempest-tossed; the gay calm summer sea was swept by a great storm-wind, which stirred the depths beneath.

'Nay, child,' he whispered, with hurried agitated breath; 'I cannot tell. Thou'dst hate me, Deb—hate me. I cannot afford to lose thy friendship even. Deb, I have few true friends. But above all, I have been mine own worst enemy! Ah Deborah, I am *most miserable*.' His head sank: lorn, dejected, despairing, he stood before her, the wild, high-spirited, light-hearted Kingston Fleming!

'Thou shalt not be miserable,' said Deborah, trembling herself, and her great lovely eyes brimming over with tears, while she pressed to his side, and twined her arms round one of his. 'All will be right, King. But for hating, I cannot hate thee, dear, being constant to my kinsfolk and my friends. Yet I will not press thee to confide in me. Take comfort. These be dark days for us all, King; brighter will come yet.'

'Thou'rt an angel-comforter, Deb.' Kingston had regained some calmness, and resumed his walk, holding Deb's hand upon his arm. 'But of all human infirmities, ye would hate weakness most. Isn't it so?'

'Weakness? Well, yes. I like not weak men. You are not weak, King!'

He laughed aloud and bitterly. 'Weak as water! Ah, ye will know it some day, perchance!'

'Mistress Blancheflower does not think ye weak, I'll warrant.'

He laughed again. 'Mistress Blancheflower thinks not much about it.'

'(They have quarrelled,' thought Deborah, 'and this makes him so reckless and unhappy. Well-a-day! I cannot interfere.') 'So it seems to you,' she answered aloud; 'but maids can be very proud, I tell ye; but because she does not shew her thoughts, you must not love her less.'

'Ah, this is sound advice, and easy to be followed! Some maids have no thoughts at all.'

'You would never have loved such, dear King! Nay, you are hard and bitter, and that makes you unjust.'

'Have I been so? Not one word have I uttered against Mistress Blancheflower. Pam fond enough of Mistress Blancheflower, Deb.'

So they said no more, and Kingston Fleming received neither rose nor kiss. He did not sleep that night, he could not, for his 'trouble.' He stepped out on the leads to smoke, and saw all Enderby lying still and peaceful in the pale glory of the moon. He stood thinking, thinking. There is her lighted window in the turret. His whole

soul ached and yearned. Why, O unhappy Kingston? He said not to his soul *then*: 'Deb, thou'rt too mad for me!' King Fleming, you are betrothed; you are about to wed a beautiful and 'honourable' lady; fly from all thoughts that would wrong her and your own honour; shut your eyes and steel your heart against the dangerous charm of Deborah Fleming; fly from Enderby! Deborah, are you witch or siren? With what subtle glamour are those eyes charged, that they haunt the captive soul, and will not let it be? Is it coldness, indifference, disdain, a sisterly tenderness—she gives him each in turn—that is maddening him so? Why was she so beautiful? Why should the sun-tanned romp of two years ago turn to so perfect and delicate a beauty? Deborah has bewitched her cousin Kingston, and for that he knows not if he loves or hates her most, as he upbraids her bitterly. Yet, has she tried to lure him on? Has she not rather rebuffed him? No; it is the very essence of coquetry to woo and fly. He will allow her no grace, but that she is a 'graceless Fleming flirt.' And then he pictures her an angel in all but wings and crown. Anon the room is dark, the light is gone, the moon is clouded over, and Deborah Fleming lies sleeping—the noble, the beautiful, the guardian of a wild old father—the sweet adviser of a reckless brother—the angel and the Rose of Enderby—the lover of honour, purity, and good faith. Too late! too late! The bright and noble soul had been unsought, uncared for in its immaturity, darkened as it was in early days, and obscured by childish shames and sudden passions; but that fatal gift of beauty roused him now to a sense of all that he had lost. Beauty had ever been Kingston Fleming's lure. Then it was only her beauty that he loved! Again he voted her fiercely a universal and wild coquette. Well, she was fair game then. Indifference, and then and again a swift glance or tender sigh, should win her yet. No matter if the rose faded, if it could be no rose to him. Then, then he would wed the lovely and uncertain Beatrix Blanche-flower. Still he lingered. 'Deborah! Deborah!' In all Enderby there is no light; and no light in Kingston's soul.

CHAPTER THE TENTH.

It was late in the morning before they met. Deborah was all sunshine and gaiety. Woman-like, she lived in the present, and realised no Enderby and no future without Kingston Fleming; the interchange of words and looks was enough for her. He turned his face aside, that she might not see how haggard it was, and was angry with her for her happiness.

Adam Sinclair came that day to Enderby, and Deborah played a dangerous part, but with infinite spirit, grace, and charm, so that it set the young man and the old man hating one another, as men can hate in jealousy. But Master Sinclair was the favoured one, and saw it. What was Master Fleming but a kinsman and a brother? So Master Sinclair rode off more madly possessed than ever, and darkly revolving plans; for Mistress Fleming he would wed, by fair means or by foul.

But the youthful beauty was not pleased. Kingston had seemed tenderer the day before; his eyes had looked admiration of her beauty; he had watched her, and given her his troubled confidence

and affection. She loved him better then. Ah, he was content. He had heard from Mistress Blanche-flower! and he cared not if she, Deborah, encouraged and even wedded old Adam Sinclair. So the rapid thoughts fled through Deborah's mind. No; she would not be treacherous to Mistress Blanche-flower, she *would not*; but she could not bear this coldness! He was leaning from the window, and watching Mrs Dinnage, who sat below at her work in the sunny courtyard, while her sworn friend and foe, Dame Marjory, fed the pigeons. Deborah went and leaned beside the window.

'Wilt ride, King? We may not have steeds to offer long.'

'Nay; I will have none of your rides. I prefer watching Mistress Dinnage. She is pretty. All girls are pretty.'

'Ye are not gracious, Master Fleming. See if I ask ye again!' Now there is one, Master Adam Sinclair, Lord of Lincoln, would ride to the world's end for me.'

'He can ask for favours in return; one day ye will pay him dearly.'

'How so, bird of ill omen?'

'With yourself.'

'Master Kingston Fleming, I do not need your auguries; once before I told you so.'

He looked up and flashed a smile—most mocking, or most tender?

She leaned from the window at his side. 'You are happier to-day, King: you can taunt.'

'O ay, I can always do that.—How pretty is Mistress Dinnage!'

'I am glad she pleases you.'

'Give me a rose, Deb, for peace.'

She gave him one. 'Throw it not to Mistress Dinnage now; she would only scorn your offering.'

Kingston touched the flower with his lips. Deborah blushed.

'If I may not kiss the Rose par excellence,' said he, 'I will kiss "the Rose's" rose.'

'Ye talk nonsense. Poetry does not suit you, King.'

'Ah, I have never written you verses.'

'I have not inspired you, mayhap.'

'Ye are too cold, Deb, save when Adam Sinclair is by. Once ye were all fire and fret; now ye are all snow and sorcery.'

'Strange blending! Have I witched you then?'

'Ay, the first day I came.'

'What worth is witchery?'

'To wear the heart away.'

'A pleasant vocation, truly, if I am working the like on you! But I thought not I was of so much dignity in your eyes as either to wear your heart or pleasure it.'

He looked in her eyes then as if his whole soul were in his own. 'Deb, art speaking truth?'

'Ay,' she answered with earnestness; 'as surely as that my name is Deborah.'

'None so blind as those who will not see.' Well, well, Lady Deb, think as ye will. Are you a coquette, Deb? I was wondering last night.'

'Oh, you do think o' me then? Well, I know not. If I lived in the great world, I might be; here, what can I do?'

'Enow; it seemeth me. It is well for ye, Deb, ye're not in the world; ye'd be a wild one! You're too beautiful by half.'

Deborah blushed, and with what covert joy Master King Fleming noted it!

'After that fine compliment,' said she, 'I will leave you to the contemplation of Mistress Dinnage. All girls are fair to you. I am going to ride. I may meet my wandering Charlie.'

'You will not ride *alone* ?'

'Ay ; not even Jordan with me. I may ride to Lincoln Castle.'

Kingston rose. 'Ye shall not have the chance. I am your cavalier, Deb.'

'As it please ye !' And away went Deborah, singing.

A SUMMER HOLIDAY IN NORWAY.

A SUMMER holiday in Norway can scarcely be otherwise than delightful. This beautiful northern land has attractions for all classes of tourists. In few other regions in Europe can there be found commingled such picturesque firths, such clusters of rocky islets, such lofty mountains, such exuberant sunshine, and such a bright ever-changeful sea. Interesting to all, it is peculiarly attractive to the lovers of Izaak Walton's gentle art. To the angler, a Norwegian lake or river has long been an aquatic Paradise. What a blissful experience it must be to hook a twenty-pound salmon, or even a five-pound grilse ; to feel it rush like an arrow through the pellucid flood, and to dash away after it through a cool forest of sedges, or over a subaqueous Stonehenge, with the pleasant hum of the line as it spins out into the river, resounding in your ears. While high overhead the lark sings in the clear air, and the silvery mists creep up the steep hill-sides, and the golden sunlight streams down through the thickets of birch and alder, dancing on the ripples of the glad some river, and shining right down into the angler's glad some heart. This is an experience worth all the elixirs that were ever invented. It braces the nerves, it expands the lungs with full draughts of the healthful mountain breeze, and makes the sinking heart bound once more elastic with the buoyant unforgotten lightness of boyhood.

Mr Arnold, in his *Summer Holiday in Scandinavia*, has done ample justice to the great and varied natural charms of Norway. Unhappily for some travellers at least, it cannot be approached without a longer or shorter sea-voyage, the pleasure or discomfort of which depends very much upon the weather. Our author in this respect was not very fortunate, for the sun kept resolutely out of sight. The sky, the dim haze-covered land, and the surrounding waves, were all one dull uniform gray ; but even with this drawback, he was struck by the rugged grandeur and beauty of the sea-wall of Norway, one of the noblest in the world. Frowning, it rises a rocky rampart of gray beetling crags, fantastic buttresses, and cliffs of limestone, embosomed in masses of delicate many-toned hues of verdure, as the silvery gray green of the birch, the brighter shade of the hazel, or the more sombre colouring of the pine, predominates in the foliage of the copse-wood, with which every available nook and cranny is crowned. Jagged peaks and serried promontories fashion themselves in the most picturesque fashion out of the gray limestone crags, sheltering lonely sequestered bays of wondrous beauty ; while beyond rise long ridges

of lofty hills, their brown sides covered in great part with odoriferous pine-forests, checkered with vivid green patches of corn-land and pasture ; with here and there a cluster of little quaint wooden red-tiled houses, lending to the beautiful wild scenery the interest of human life and industry.

At Christiania Mr Arnold and his party landed amid a group of placid onlookers ; and having, chiefly by their own efforts conveyed their luggage to the custom-house, found that dreaded ordeal to be in Norway mere child's play. 'An old official,' says our author, 'with a flat cap, looking remarkably like a Greenwich pensioner, patted some of the luggage, and said in good but brief English : "Tourists !" "Yes," replied our spokesman. The old official then bowed, intimating obligingly that Norway was glad to see us, and waved his hand for the next lot.' A month was the time that the party had to spend in Norway ; and after mature consideration, they decided that the best route for them would be from 'Christiania by Lake Miosen to Giovik and the Fille Fjeld *via* Fagernes, and so to Bergen by Lerdalsoren, returning by the southern road and Lake Kröderen.' What they could not determine was, whether to walk or ride or drive ; but at last they decided that it was best to do as the Romans do, and wisely fell back upon the native carriages.

As these are quite an institution in Norway, they merit a few words of description. Imagine a low light wooden conveyance, somewhat spoon-shaped, with an upright splash-board in front, two very large wheels, and a big apron buttoned down on both sides around the traveller. A sensible conscientious cream-coloured pony is attached to it in front ; and behind, perched on a shaky projecting board, is a fair-haired, sallow, phlegmatic-looking peasant, boy or man as may be, who is called a *skyds-carl*. You may drive yourself, if you choose ; and if you do, you may possibly flatter yourself that you are lord, if not of all you survey, yet still of the cream-coloured pony in front of you, and may make the pace according to your liking. Never was a greater mistake. The *skyds-carl* perched behind is that pony's master, not you ; and if he chooses to utter in a low tone bur-r-r-r-dar-r, you may flog until you are weary ; neither whipping nor coaxing will make the sagacious creature quicken its pace an iota. The *stol-kjærre* or country cart is a square wooden tray with large wheels, and a low-backed seat across the centre, sometimes with and sometimes without springs. The posting stations are more or less picturesque as regards scenery, but are all built upon one plan, of red pine logs, around a spacious yard, which may be tidy or untidy according to the taste of the inmates. Barns or other outhouses form two sides of the square, the house makes the third, and the fourth is supplied by the road. The buildings are roofed very generally with sods of turf, forming a plateau on which long grass and wild-flowers wave luxuriantly. The food to be procured at these stations is good of its kind : salmon, trout, reindeer venison, mutton ; and wild-ducks in abundance if the tourist can shoot them—all very tolerably cooked. By way of dessert, there are wild raspberries, strawberries, and molteberries, a yellow insipid fruit of a pale amber colour, which tastes like a rain-soaked raspberry. The only bread to be procured at the up-country stations is *flad-*

brød, to whose qualities Mr Arnold bears the following affecting testimony: 'It is thin, dry, dusty, full of little bits of straw, and quite tasteless, like the bottom of a hat-box with the paper torn off.'

The household arrangements of these posting establishments are often very primitive. The front door sometimes opens into the sleeping-room of the entire family; and if you arrive any time after nine P.M. you may see on entering the master and mistress of the mansion reposing on a broad high shelf at one end of the room near the stove, while the rest of the family and guests of lowly degree recline around on benches, or on the floor, where they can at least have what room they require. This is a luxury which no tall tourist need expect in a Norwegian guest-chamber; there the beds, although furnished with appliances for making them as wide, if need be, as the famous bed of Ware, are seldom longer than five feet eleven.

The roads, although necessarily steep at places, are fairly good; but most of the bridges are constructed in a very primitive style. The natives are a kind, hospitable, honest, but somewhat apathetic race. Watching their stolid expressionless faces, one cannot help wondering where the superabundant energy of the old vikings has betaken itself to. During the long winter evenings, the women knit and spin a great deal. They provide themselves plentifully with household linen and homespun clothes, which are often of a dark-brown colour, enlivened in the case of the men by a bright scarlet cap, and in that of the women by a white kerechief tied under the chin. In appearance, a small Norwegian farmer is very like an English labourer. His house, built of wood and thatched with sods, is devoid of ornament, but has no lack of solid comfort, and is sufficiently warmed by a huge quaint-looking iron stove.

The women on holiday occasions turn out in the old Norse costume, the chief feature of which is the bodice, which is often made of some bright-coloured velvet, turned down in front with white silk, and faced before and behind, according to our author, 'with several yards of fine silver chain, each chain ending in a silver bodkin, in order that they may be the better threaded through double rows of eyes (in themselves strikingly pretty articles of silver), that run in four lines up the back and front of this showy piece of Scandinavian haberdashery.' Both men and women are very fond of large bright buttons and of silver or plated ornaments.

Bears abound in the dense forests of Norway and on the high barren uplands; and thrilling stories are told of hair-breadth escapes from these fierce but sagacious animals. A sportsman near Maristuen was one day wandering in a birch thicket, when he suddenly came upon a huge bear regaling itself with raspberries. Bruin was peaceably inclined, and fled; but he instantly gave chase. With a speed perfectly surprising in such a lumbering unwieldy animal, it ran down the hill-side, while he rushed after it in hot pursuit, till on a steep slope of the mountain it suddenly disappeared. There was a little patch of brushwood before him, over which he leaped, and hearing an ominous crashing of branches in his rear, turned round, when there was the bear, which, with a murderous growl rushed right upon

him. Instinctively he raised his rifle and drew the trigger just in time, for almost at the same moment the infuriated brute seized the muzzle of the piece, which exploding, blew its head to atoms.

A Norse wedding is always preceded by a series of presents from the bridegroom to the bride. First, there are about two dozen meal-tubs of various sizes, elaborately painted; and last and crowning glory of the *trousseau*, there is a wonderful clothes-press. Inside, as far as regards drawers large and small, and brass pegs and racks for crockery, it is a marvel of ingenuity; while outside it is a perfect triumph of art. The ground tint is a warm bright vermilion, painted all over with green and yellow scrolls, enlivened with wreaths of gorgeous flowers, and piles of brilliantly hued fruit, pleasingly interspersed with quaint lovers' knots and bleeding hearts transfixed upon Cupid's darts, in the midst of which are the names and birth-dates of the liberal donor and blissful recipient of this magnificent wedding-gift. A Norwegian maiden, who is generally as sober as a linnet in her ordinary attire, appears on her bridal day glittering in all the colours of the rainbow. On her long fair hair is set an antique crown of silver gilt; and her bodice, stiff as a cuirass, is thickly studded with beads, silver-gilt brooches, and small mirrors. This bridal adornment is too valuable to be the individual property of any Norse belle, but belongs to the district, and is hired out for the day.

The scenery in Norway is remarkably beautiful; the mountain roads often wind along the base of huge gray cliffs with steep dells beneath, where some bright salmon river may be seen sparkling along beneath the gloom of the overhanging pine-trees, or some soft blue lake may be discerned glimmering like a sheet of silver in the sunshine, or pillowing on the stillness of its waveless breast the mighty shadows of the everlasting hills.

At Strande Fjord, one of these lovely lakes, which was shut in by a dark background of pine-clad mountains, whose rugged sides were furrowed with deep torrents and white lines of waterfalls, our travellers found in the pleasant station-house a party of seven English ladies and gentlemen, tempted, like themselves, to make a halt of a few days at this charming spot. Here there was every variety of scenery—lofty mountains, precipitous waterfalls, dense pine forests, and wide undulating stretches of fresh green meadow-land; while in the midst slept the tranquil lake; now kissing with tiny wavelets the pebbles on its silvery shore, now bending away round the bold red cliffs, that guard like weird sentinels this lake Paradise of the North. The face of the huge crags is frayed and worn into deep shadowy caves, whose roofs are tapestried with a profusion of ferns; while by the precipitous margin of the lake, long verdant palm-like fronds wave in the breeze, or stoop to meet sub-aquatic forests of weeds and water-lilies.

Lerdalsoren, the highest point which they reached, was a quaint overgrown village, nestling between high green and purple hills. Insignificant as they accounted it, it was a town of no small repute in the surrounding wilderness, for it possessed a doctor, a church, two hotels, and a telegraphic office. Still, in spite of all these advantages, it was an undeniably dismal little

place, intensely cold, and with nothing to offer by way of comfort for the inner man, except salmon, a viand of which, when confined to it exclusively, people tire sooner than of any other.

Wide ranges of mountains extend all around Lærdalsoren, towering up one above the other in savage grandeur till their jagged snow-clad peaks seem to pierce the sky. Gray and yellow patches of reindeer's moss carpet the sheltered nooks and hollows among the hills, and the deer themselves are abundant: the skyds-carl pointed out a hill where a native sportsman had recently shot nine in one day.

So bitter was the cold, that before they reached Bjoberg, on the downward road, they were half frozen, and could scarcely hold the reins.

From Bjoberg the descent was rapid, and was like the change from Christmas to midsummer; the sun's rays became warmer and warmer, and the breeze more mild, until they exchanged the snow-clad hills, the bleak uplands, and the barren patches of reindeer's moss, for the wild-flowers, the sparkling rivers, and the luxuriant greenness of the northern summer.

At Huftun they found excellent entertainment at the house of Madame Brun, a Frenchwoman, whose superior cookery worthily sustained the high gastronomical pretensions of her nation. Near her pretty house they shot two varieties of the woodpecker, and saw tranquilly sailing in mid-air, a few hundred yards from them, a splendid specimen of the Norwegian eagle.

The most abundant bird in Norway is the magpie, which the peasantry, from superstitious motives, seldom or never kill. There are also great quantities of the hooded or gray crow, abundance of swallows and snipes, and great flocks of wild-ducks of five different kinds. Generally, they are excellent eating; but at the Lillie Strand a black duck was shot, a bird of such a singularly unpalatable and fishy *goût*, that our author jestingly supposed it must be a stray member of the species which the Pope benevolently allows good Catholics to partake of on Fridays.

Grouse, rhyper, and woodcock are also found. Grouse one would fancy must be abundant, judging from the experience of an Englishman who is reported to have killed twenty-two brace in one day.

Lake Kröderen they found a pretty placid sheet of water; but after the surpassingly grand and beautiful scenery through which they had passed, it seemed to them tame; and as it was impossible to obtain any refreshment on board the steamboat which plied on its waters, they made no unnecessary delay, but pressed on as quickly as they could to Christiania, whence they repaired, *vid* Jonköping and Helsingborg, to Copenhagen.

The Swedish railways they found very slow, and the country flat and uninteresting, except around Lake Wenern, which was beautiful, and had besides all the interest associated with the birthplace of Linnæus. They passed the little village in which the boyhood of the great botanist was spent, and called to mind that as a child he could not recollect names; and was voted, even at the university of Lund, a most superlative dunce, who could not be made to display much interest in anything except the pursuits of his father and uncle, who were ardent botanists. So poor was the household of this illustrious Swede, that his

father could only allow him eight pounds a year for his whole collegiate course; and the poor student while at Upsal had often to mend his shoes with gray paper, and sally forth rod in hand to eke out his slender meals with a few fish from the lake. The country between Elsinore and Copenhagen impressed them favourably; it is, our author says, 'dense with beech and fir woods, and full of glades, lakes, and park-like lawns.'

Copenhagen is a handsome town, with a population singularly English-looking in manners and appearance. Its great point of attraction for our tourists was the Museum, filled with the works of Thorwaldsen, the Phidias of the North. Here, in the middle of a large hall, a cenotaph is erected to the memory of the great sculptor; and around stand the imperishable monuments of his genius, instinct with the classic grace, with the refined delicacy, with the glorious beauty of old Greek art, carried to as great perfection beneath these cold skies of the gray North as ever it was in sunny Athens.

From Copenhagen our tourists returned by Jutland and the Hamburg railway to Calais; having enjoyed their holiday so much, that Mr Arnold recommends 'all the lovers of nature to see Norway as well as Seville before they die.'

THE ADMIRAL'S SECOND WIFE.

CHAPTER I.—SURMISES.

A DREARY evening, rain and sleet chasing each other alternately, and making the streets of the busy town of Seabright dismal as streets can well be. Yet there must be some fascination in the outdoor scene, or Katie Grey would not stand so long peering out of the window into the dim dark night. Presently a carriage comes in sight; splash go the horses' feet into the deep mud; there is a quick rattle of wheels, a sudden glitter of white dresses, scarlet cloaks, and brilliant uniforms through the misty windows, and the vehicle passes rapidly out of sight.

Katie adds up on her fingers: 'That makes the tenth carriage. Everybody is invited except us. Why—*why* have we been left out?'

Miss Grey is standing alone in a darkened room. She has turned down the gas, that she may see without being seen, and she remains hidden in the shade of the deep crimson curtains. There is a party at Government House this evening. News has reached her of numerous invitations that have been issued, and she is mystified and perplexed that neither note nor card nor message has found its way to her house. Hitherto Katie has been a favoured guest at the Admiral's. No festive occasion has seemed complete without her presence. She has sung to Sir Herbert Dillworth, played for him, talked to him; and he has stood entranced beside the piano, whispering thanks, that she has interpreted at their full value. 'What can have changed him now?' She has asked herself that question over and over again; but so far no answer has come to her restless surmises. Presently a hack cab comes in sight; and instead of driving past the window,

it stops suddenly at her door, deposits its burden, and goes on its way. Katie distinguishes a flash of gold-lace and hears the rattle of a sword on the door-steps. Wondering much who can have come to the wrong house, she starts when a servant throws open the door and announces 'Captain Reeves.'

Katie comes out from the crimson curtains in much confusion, vexed at the bare possibility of being suspected of spying at guests more favoured than herself. With a flushed cheek she turns on the gas and quickly goes forward to greet her visitor. Captain Reeves is a tall man, with dark hair, keen dark eyes, and with an unmistakable air of being on perfectly good terms with himself. He wears full naval uniform, and has ribbons and clasps on his breast. His first look at Katie is one of amazement, for he sees she is in her usual home costume, and is not dressed for the party at Government House.

'What! not ready, Miss Grey!' he exclaims quickly.

'Ready for what?' inquires the young lady with transparent dissimulation. Whatever her private discomfiture may be, she has no intention of proclaiming it to all the world—least of all to Walter Reeves.

'We shall be late. Your manima offered me a seat in your carriage; so I have taken her at her word, and am come to join your party.'

'We are not going to the Admiral's to-night.'

'Not going! Is anybody ill?' He starts back a step, as though the news is incredible; and Katie laughs merrily.

'We are all quite well, thank you; but we don't consider ourselves bound to attend every party. You don't grudge us a quiet evening at home sometimes, do you?'

'O no, certainly not; but I'm sorry your taste for retirement asserts itself to-night. I'm horribly disappointed; and if there's anything in the world I hate, it's these semi-official, stuck-up assemblies. I'd far rather stay here and have a chat with your father.'

Walter Reeves has seated himself by this time, and is watching Katie, as she plucks off a geranium leaf from a stand near her and crushes it between her fingers.

'You'll be sure to enjoy yourself when you get there.'

'I'm very sure I *shan't*. You're the only one I cared to meet! I can tell you the Admiral expects you all.'

'How can you possibly know that?'

'Because he said so. I went to his office this morning about some question of duty, and he suggested I could talk it over this evening with your father, for you were all going to Government House.'

A quick blush rises to Katie's cheeks, giving a wonderful brilliancy to her complexion; just the warmth and tinge needed to make her beauty perfect. She stoops down, apparently to look

more closely at the geranium leaf, in reality to hide the glow of triumph that flashes from her eyes, as her rapid thoughts sum up the case. 'So Sir Herbert is not to blame after all. *He* expects me to-night. Who then can have thrown this slight on our household?—I know! I know! Blind that I was, not to suspect it before! Mrs Best, the Admiral's daughter, has done it. She is afraid and jealous of me!' The geranium leaf falls to the floor, but Katie does not notice it, nor does she see that Walter is smoothing it out, to the evident damage of his pure white kid gloves. He is furtively gazing at Katie in a half-vexed, half-admiring manner; thinking how well she looks in that dusky, shadowy, black dress, with that band of crimson velvet in her hair. Not one of the girls at the Government House party, with all their splendour and show and glitter, will match her. He has never seen her equal, except perhaps in the orange groves and sunny gardens at Valparaiso. There he has sometimes met with beautiful women, graceful hours, resolute with beauty and light, tinged and ripened with the glow of that fervid climate.

'You will be dreadfully late at the party. Why do you waste your time here?'

'I am *not* wasting my time; and even if I were, I deserve some amends for being offered the corner of a carriage, and then being thrust out in the cold. I don't care in the least about going,' he exclaims in an aggrieved tone.

Katie laughs, with a gay mocking ring in her voice. 'Oh, you will change your opinion by-and-by, when Mrs Best is singing one of her ducts with you.'

'I hate Mrs Best's singing! That tiny pipe of a voice of hers, that she calls "soprano," is nothing to boast of after all. I don't mean to sing a note to-night.'

'Oh, how cruel of you. What will people do? But you will not be able to resist, when Mrs Best begins to persuade you and purr at you. Do you know what she always reminds me of?'

'How can I tell what your fertile imagination may portray?'

'She reminds me of a beautiful Persian cat my grandmother once had—a rare, soft, splendid-looking creature, with lovely white fur, innocent mild eyes, and with blue ribbons round its neck. You would never dream of its cruel claws, till you saw the bleeding scratches on your hand.'

Captain Reeves looks puzzled. 'I don't see the resemblance.'

'No, no; you don't understand my nonsense; so please don't notice it. And now, as you don't seem in the slightest hurry to go to Government House, we won't stay in this cold room any longer. Come up to the drawing-room; they will all be glad to see you.'

'Thanks; so. I must be off now; but remember! the next time I accept a corner in your carriage, I shall make sure you are going, before I dismiss my cat. Good-night.'

CHAPTER II.—A QUIET EVENING AT HOME.

With a smile still lingering on her lips, Katie hears the door close after Walter Reeves; then she goes up-stairs to join the rest of her household. A calm family scene meets her view as she throws open the drawing-room door. The room is not a large one; but what it wants in size is amply atoned for by the exquisite taste with which everything is arranged and grouped. A few strokes of the pen might describe the well-chosen accessories of curtains, sofas, and carpet; but it would take artistic skill to portray the many touches of prettiness and beauty to be found there.

The few paintings that hang on the walls are marvels of delicate colouring and completeness of design; the ornaments of various kinds about the room are most of them due to feminine cleverness; screens, cushions, chair-covers, all shew that busy graceful fingers have been at work; but they were not Katie's fingers—not the outcome of Katie's industry. She has a perfect abhorrence of fancy-work; rarely is she to be found sitting down like other girls to puzzle her head with intricacies of knitting, lace-making, or embroidering. Her plea is: 'I haven't patience for that sort of thing, nor have I taste or time for it. Here Nellie, my dear, you puzzle out this pattern; and while you are doing it, I'll play any amount of pieces you like—Beethovens, Mozarts, Mendelssohns, or Schuberts, which you choose.'

So patient Nellie of the artistic mind and home-loving tastes would pick up her sister's discarded work, and skilfully mould it into wondrous results of aptitude and dexterity.

Nellie is sitting at the table on this evening, bending over a volume of travels. She who rarely leaves the house herself, yet likes to read of scenes of wild adventure and foreign travel, with all their detail of fervid luxuriance and gorgeous scenery. Her delight is in tales of peril and bravery. A piece of bright-coloured embroidery lies beside her. She is evidently reading and working by turns.

At first glance of Katie's youngest sister, one is struck by her sweet countenance and delicately moulded face, the calm blue eyes and thoughtful look. But at the next glance, one sees that her figure is hopelessly deformed. Some blight has fallen on her in early childhood, and closed to her for ever the active pursuits and enjoyments of life. But Nellie is happy and contented in her placid way; she has resources and pleasures of which Katie has never even time to think. The school of weakness and suffering has taught her many a salutary, many a holy lesson. At the further end of the room sits Mr Grey, the master of the household, a thin, wiry, irritable, high-principled man, with white hair and close-cropped white head—a man who thinks himself a very martinet in his strict ideas of discipline on board ship; but who is a tame enough, easily ruled ruler in his own house on shore. He flatters himself he is very firm with Katie, yet she manages to have her way in most things. Mr Grey, with a small table before him, is engaged with navy statistics, making calculations that will open the eyes of the Admiralty some of these days, he thinks.

His wife is the only other member of the family party, and she is a soft, pillowy, amiable, motherly woman, with no very demonstrative ideas of her

own, but rather ever proving herself a mild reflector of the thoughts and wishes of the various stronger minds of her family.

It is on this placid scene that Katie dashes like a brilliant meteor. Somehow, she never can do anything quietly. She is never the one to steal into a corner and settle herself down there, lest she should disturb any other person; rather she makes the constant sense of her presence felt; there is always something in her movements that draws attention to her and centres it there. Thus, when she opens the door, they all gaze up at her. Mrs Grey, who has been dozing off now and then into calm forgetfulness, picks up her knitting and looks at her daughter with a sigh. The sigh is one of sympathy, for she knows the depth of the mortification under which her daughter has been labouring, and does not know the panacea has come. She does not know Katie has armed herself for combat, and is quite prepared for a tilt with Mrs Best when the opportunity arrives. No red-skinned Indian with war-paint and tomahawk is more ready for action with a rival chief, than Katie is to assert her power over the Admiral's daughter. True, her weapons are only woman's witchery; true, the disputed prize is only a warrior's heart; yet the strife promises to be difficult, perhaps prolonged. In other words, Miss Grey has said to herself: 'If Sir Herbert makes me an offer, I will marry him; and then Laura Best will discover that even *her* influence does not equal *mine*.'

'Where have you been all this time, Katie?' asks Mrs Grey in a plaintive tone.

'Down in the dining-room.'

'What! in that cold room, alone? You should not mope so, my dear. You should come up here with us, and be cheerful.'

Katie gives one of her ringing laughs as she replies: 'Oh, I have not been moping, mother; neither have I been alone. Walter Reeves called in; and do you know you have half offended him, for you asked him to go with us to Government House.'

'So I did, sure enough. I said we should have a carriage from Robyn's livery-stables as usual, and that there would be plenty of room for him. I little thought *then*, we should not even have an invitation. Was Walter very angry?'

'I daresay he has got over it by this time, and is sunning himself in Mrs Best's smiles. Do you know, mother, I have found out it was Laura who would not invite us to the party? It was not the Admiral's fault after all.'

'I can't see that makes any difference, Katie: the fact remains the same.'

'But it *does* make a difference—a very great one to me; and I'm so glad I've found out the truth at last.'

Katie sees her sister looking up over her book at her with grave reproach in her blue eyes. If Mrs Grey is too obtuse to understand, Nellie is not so blind, and she has a sudden revelation of what it all means. She knows the sublime selfishness of her sister, her ambition, her love of retaliation; and the unspoken reproof makes Katie turn suddenly away and seat herself at the piano. A feeling of defiance actuates the girl at the moment; and she begins at once to sing one of Sir Herbert's favourite songs, one he has often asked for, a stirring vigorous melody, that goes straight to the heart, and wakens up whatever is brave and

martial in one's nature. Mr Grey closes his books at once; he knows he cannot reckon up decimal fractions while the room is flooded with music and melody, for Katie's rich voice and brilliant accompaniments arrest attention at once. Mrs Grey listens also, and dozes between whiles, thoroughly enjoying her evening at home. Though she would have shaken off her drowsiness, and dressed herself in one of her rich brocaded silks or lustrous moires, and would have accompanied Katie to the scene of action, had she been an invited guest at the Admiral's to-night. Willingly would she have gone through any amount of inconvenience, rather than this handsome daughter of hers should fail of proper escort, or infringe any of the 'thousand-and-one' rules of etiquette.

CHAPTER III.—AT GOVERNMENT HOUSE.

Captain Reeves is in no placid frame of mind as he goes on his way to the Admiral's. He passes through the grim strong gates at the entrance, near which a sentry is solemnly pacing to and fro. He walks down the long pathway, on each side of which huge tubs of aloes hold out their dark sharp-pointed leaves, and then he goes up the broad brightly lighted stairs. The rooms are already full of people; a confused well-bred murmur of conversation rises from the throng of guests in mingled subdued tones. Sir Herbert is standing inside the larger drawing-room, talking with a group of officers; but he leaves them the moment he catches a glimpse of Walter at the door. He even goes to meet him with a smile of welcome on his lip, looking all the while over his shoulder, as though he expected to see other guests coming with him.

'You are late, Captain Reeves. But where is the rest of your party? Did you not say you were coming with the Greys?'

'The Greys won't be here, Sir Herbert. I called there, but find none of them are going out this evening.'

'Is any one ill?'

'O no'; Miss Grey tells me illness is not the cause of their non-appearance. She did not give any reason for their sudden fit of seclusion.'

'Very strange!' murmurs the Admiral; and he saunters away to another part of the room, where other guests speedily claim his attention. A curious observer though, might observe a shadow of disappointment has come over his face, also that he is unusually grave and thoughtful during the rest of the evening.

Sir Herbert is by no means an old man, as some reckon age. He has a grave refined face, keen penetrating eyes, dark hair beginning to grow a little thin on the temples. He wears uniform, and a star that gleams forth upon his breast tells that he has done good service for his country. His composed dignified bearing might well bear comparison with many far younger men in that brilliant assembly. His smile is sweet, and lights up his rather serious face like sunlight; but the Admiral is generally grave; his thoughts are earnest, his life is earnest, and he is not by any means easily moved to mirth.

Walter Reeves, as in duty bound, makes his way towards the lady who at the present holds sway in her father's house. But it is no easy matter to reach her, for the crowd is considerable.

Men are lounging about, dressed apparently in every kind of uniform under the sun. The dark-blue of the navy of course predominates, but the marines and several line-regiments are amply represented. Swords, epaulets, and stars glitter and sparkle from every part of the spacious well-lighted rooms.

Elegantly dressed ladies add to the goodly show; and their many-hued robes mingling among the varied uniforms, add brilliant colouring to the scene. Here and there, a few black coats are visible, but civilians are rare on this evening. Walter Reeves, who is fond of pleasant effects, notes all this in his half-careless half-indolent way, as he slowly makes his passage through the throng and advances to the inner room. Mrs Best is seated on a low sofa, looking like a queen in her court, for many and admiring are her courtiers. Red coats and blue coats jostle each other, in the anxiety of the wearers to get speech with the lady of the house. Very pretty and graceful she looks as she sits there, dividing her favours with impartial hand. She has a fair blooming face, bright eyes, and a girlish lively manner. Her dress is of snowy crape, that falls round her like a fleecy cumulous cloud; the pale lavender trimmings that peep forth here and there in fringe and ribbon, are the last faint remains of mourning dedicated to her late husband. To catch the sparkle in her laughing blue eyes, to note her almost flaxen hair and eyebrows, to mark the rounded grace of her youthful figure, one would hardly imagine her to be a mother and a widow. Yet such is the case: she has two visible responsibilities at home in the shape of two little sons, who are at that moment, it is to be hoped, soundly slumbering in their far-away nursery down at Hayes Hill. Laura Best looks like some sunny-hearted merry girl just out of her teens, so innocent and guileless is her countenance, so silvery are her peals of musical laughter. Her sofa is placed in a kind of alcove slightly away from the full glare of the light; on each side fall the soft folds of white lace curtains, for the sofa is placed between two bow-windows. Behind it is a high stand of beautiful plants; many coloured hoyas display their clusters of waxy flowers; delicate white azaleas and rose-tinted and crimson camellias mingle their blooms, and hold their proud heads above their glossy foliage.

Mrs Best smiles to herself as she sees Walter Reeves advancing. A suspicion had been haunting her that as the Greys were not coming, for reasons she knows well, he would frame some apology and decline to put in an appearance. So she holds out her hand to him, playfully chides him for being late, and speedily draws him into conversation—that flows naturally and brilliantly wherever Laura Best chooses to make herself a centre. By-and-by Walter finds himself by that lady's side in the music-room; a small place, draped with rose-coloured curtains and lit with soft wax-candles, and just holding a piano, a harp, and a limited number of performers and listeners. As he takes part in a trio with Mrs Best and Major Dillon, and watches Laura's white dimpled hands running over the ivory notes of the piano, bringing out sweet sounds in her own light rippling manner, he remembers Katie's words about 'hidden claws,' and smiles as he recollects how severe and satirical Miss Grey can sometimes be.

He remains in the music-room all the rest of the evening, and does not seek to join the various groups of men, who are either talking politics or discoursing naval matters. And when at last the evening comes to an end and he goes out of the gates again, he confesses to himself that the time has passed pleasantly and rapidly enough, even though Katie Grey was absent.

TRICKS IN THE WINE TRADE.

AMONGST articles of daily consumption in this and other countries, perhaps none is more adulterated than wine; and although the attention of the public has been, from time to time directed to the evil, the evil seems to continue unabated.

Hamburg has long enjoyed a notoriety for the manufacture of sherry—a merely fictitious article, in which no real sherry has any existence, but which, imported to England, passes muster as genuine wine. Latterly, to the discredit of France, false wines have been largely fabricated and vended in that country; for it is as easy, if not easier, to imitate French wines as the wines of Spain or Portugal. It is well known to persons in France, that Nancy, the ancient capital of Lorraine, bears a bad name as having been the first to set the evil example of a systematic adulteration of French wines, white and red. Lorraine, Alsace, and Luxembourg are notoriously the seat of a very extensive manufacture of spurious wines, some of which owe nothing whatever to the vine. Imitations of the most renowned brands of champagne, such as Roderer or Clicquot, are here concocted from rhubarb-juice and carbonic acid, made cheap and sold dear. Light clarets, strong St Georges, Macon, and the rough red Roussillon, can be turned out to suit all tastes, merely by re-fermenting squeezed grape-husks that have already done duty, in company with the coarse sugar extracted from potatoes. Various colouring matters are added, such as caramel, cochineal, and the more formidable fuchsine, and the highly tinted compound is ready for the market.

Narbonne, nestling amidst her vineyards, is not much behind northern Nancy in audacious falsification of the strong natural wines that form the staple of her trade. It has long been the custom with these south of France wine-growers to press the grapes a second time with the addition of some water, and to brew a light, thin, vinous liquor, which was doled out in rations to the farm-servants, or sold at an exceedingly low rate. It has lately occurred to them that this second-hand commodity, dosed with tartaric acid, thickened with treacle, and artificially coloured, would pass muster with heedless consumers as good ordinaire; and as good ordinaire, or Wine of the Plains, it is accordingly vended. First class and even second-class wines, it is well to bear in mind, are invariably the vintage of some hill-side or mountain slope, but even the low-lying vineyards of a wine-growing country yield a growth which has deservedly a good name with buyers of moderate means. This good name, unfortunately, the land-owners and metayers of Southern France seem resolved to throw away, in their hurry to be rich.

What most perturbs, not merely the doctors and scientific men of France, but the French government as well, is the deleterious character of the colouring matters employed in palming off mock

or inferior wines on the unwary public. The syndicate of Narbonne have formally complained to the Minister of Agriculture that Portuguese, Italian, and Spanish wines, all coloured by elderberries, enter freely into France. But the growers of the Narbonne district have themselves learned to make liberal use of the elderberry and of other ingredients less innocuous. Fuchsine, which is extracted from coal-tar, and of which immense quantities are employed, is the agent in the worst repute; but it imparts a fine ruby-red, and is therefore in high favour. Fuchsine, which is prepared by adding arsenical acid to aniline, is admitted on all hands to be poisonous, although the authorities have as yet hesitated to take vigorous action with regard to its abuse.

There are other colouring principles less dangerous than fuchsine, but still injurious to health, which are in daily requisition for the manipulation of wines. There is caramel, an extract of mallow; pink althæa; Mexican cochineal; rosoline, derived from tar; colorine, and many a fantastically named essence, sometimes of vegetable, sometimes of mineral, or even animal origin. The ammoniacal cochineal which gives so brilliant a dye to the scarlet cloth of an officer's uniform, is decidedly inappropriate as an adjunct to wine. Each ounce of cochineal, it should be known, represents several thousands of cochineal insects boiled down to a pulp, and was once excessively dear. It is cheaper now; and in the July of last year a single grocer of Narbonne sold ten thousand francs' worth of this scarlet colour to wine-growers of the village of Odeillan alone, for the artificial tinting of poor and pale wines.

M. Paul Massot, who in the French Assembly represents the department of the Eastern Pyrenees, has taken the leading part in a sort of crusade for the repression of the new frauds in the wine-manufacture, and has been able to lay before the government a mass of authentic evidence on the subject. It was proved, for instance, by careful analysis that a quart of one especial kind of wine, reddened by elderberry juice, contained no less than half an ounce of alum. It was proved also that the red extract of coal-tar, known as grenate, and formerly flung away as refuse, now commands a high price as an ingredient in the composition of that fuchsine which is now tossed by the hundred-weight into wine-vats.

The best and readiest means of detecting the presence of artificial colouring in wines we owe to the ingenuity of M. Didelot, a chemist in Nancy. A tiny ball of gun-cotton supplies us with the necessary test. Dip it in a glass of the suspected wine, then wash it, and it will resume its whiteness if the wine be pure; if not, it will retain the ruddy colour due to the treacherous fuchsine. The addition of a few drops of ammonia gives us a violet or a greenish hue when vegetable matters have been made use of to impart the desired colour.

Other and more elaborate tests on a larger scale have been devised; and with the aid of acids and ethers of peroxide of manganese, and notably of chloroform, the tricks of the wine-forgers have been completely exposed. Even benzene forms, with fuchsine and its fellows, a red jelly that swims on the surface of the discoloured liquor, and by skilfully conducted processes, a precipitate, varying in colour, can in every instance be obtained. Government and the public have now taken alarm,

and it may be hoped that before long the adulteration, by means of fuchsine at all events, will be effectually checked. It must be remembered that growers and dealers were probably in the first instance quite unaware of the dangerous nature of the convenient drug which gave so tempting an appearance to their stock in trade; but publicity, and the recent seizures of falsified wines which have taken place at Paris, Nancy, and Perpignan, may probably serve to enlighten them upon the subject.

TIT FOR TAT.

So long as men are what they are, those who can hit will give blow for blow, literally or metaphorically as the case may be, and standers-by will delight in the passage-at-arms.

Certainly it is pleasant to hear a sayer of ill-natured things put down by an intended victim of his cynical tongue. 'The great assembly,' as Manningham terms it, must have greatly enjoyed the discomfiture of a certain Lord Paget, who, oblivious of his own mean origin, thought to extol his superiority by asking Sir Thomas White what he thought of the quality of the cloak he wore. 'Truly,' replied the worthy alderman, 'it seems to be a very good cloth; but I remember when I was a young beginner, selling your lordship's father a far better, to make him a gown when he was sergeant to the Lord Mayor; and he was a very honest sergeant.'

Nor did those behind the scenes at a certain theatre fail to appreciate the situation when a prosperous equestrian's daughter observed to a retired actress: 'After all, you were only a circus artist; my father recollects you well;' and the elder lady retorted: 'I daresay he does, my dear; he used to chalk my shoes.'

'When Lincoln and Douglas stumped Illinois as rival candidates, the latter in one of his speeches declared he remembered his opponent when he served liquor behind a bar. 'That's so,' said Lincoln; 'but the judge has forgotten to mention that while I was serving the liquor on one side of the bar, he was drinking it on the other.' A mild bit of retaliation compared with that inflicted by Brougham upon his fellow-actor Burton. In reply to the first-named asking if he had read the last number of the *Lantern*, a comic paper in which Brougham was personally interested, Burton said he never read the thing unless he was tipsy; a compliment his questioner acknowledged with a bow and, 'Then, Mr Burton, I am sure of one constant reader!'

It is well not to shew contempt for a book to its author's face, as newly made Sergeant Murphy learned when dining in company with the author of *Ten Thousand a Year*. He called out across the table: 'Warren, I never had patience to finish that book of yours; tell me what was the end of Gammon?' 'Oh,' said Warren to the lawyer, 'they made him a sergeant, and he was never heard of after.'

Charles Dickens turning over the leaves of a literary lady's album, came upon a page bearing the autographs of Daniel O'Connell and Joseph

Bonaparte, and over against them read, in Southey's handwriting:

Birds of a feather flock together;
But *vide* the opposite page;
And thence you may gather,
I'm not of a feather
With some of the birds in this cage.

Underneath the Laureate's lines the novelist wrote:

Now if I don't make
The completest mistake
That ever put man in a rage,
This bird of two weathers
Has moulted his feathers,
And left them in some other cage—

a reflection upon the poet's political inconstancy, that called forth a *quid pro quo* from one of Southey's admirers, who thought a man had as much right to change his opinions as to alter his style:

Put his first work and last work together,
And learn from the groans of all men,
That if he has not altered his feather,
He's certainly altered his pen.

Seeing that men of all sorts delight in girding at the professors of law and physic, it is strange that instead of making common cause together, lawyers and doctors rather cherish a mutual antipathy, which finds vent in an amusing interchange of asperities. Cross-examining Dr Warren, a New York counsel declared that a doctor ought to be able to give an opinion of a disease without making mistakes.

'They make fewer mistakes than the lawyers,' responded the physician.

'That's not so,' said the counsellor; 'but doctors' mistakes are buried six feet under ground; a lawyer's are not.'

'No,' replied Warren; 'but they are sometimes hung as many feet above ground.' The advantage was with the doctor.

It was on the other side when, disputing as to the comparative merits of their professions, Sir Henry Holland said to Bobus Smith, ex-advocate-general: 'You must admit that your profession does not make angels of men?' and the lawyer replied: 'There you have the best of it; yours certainly gives them the best chance.'

Said a pompous man of money to Professor Agassiz: 'I once took some interest in natural science; but I became a banker, and I am what I am!' 'Ah!' replied Agassiz, 'my father procured a place for me in a bank; but I begged for one more year of study, then for a second, then for a third. That fixed my fate, sir. If it had not been for that little firmness of mine, I should now have been myself nothing but a banker.'

The money-dealer must have felt as small as the American judge who, finding his enforced bed-fellow by no means overwhelmed by the company of a person of his dignity, observed: 'Pat, you would have remained a long time in the old country before you could say you had slept with a judge.' 'True for you,' said Pat; 'and yer Honour would have been a long time in the old country, I'm thinking, before ye'd been a judge!'

Joseph Hume, the economical reformer, having occasion to visit Brussels when Sir Robert Adair was our representative there, mindful of the

minister's repute as a host, lost no time in leaving his name at the legation. Remembering Hume's constant attempts to cut down official salaries, Sir Robert was inclined to ignore the hint; but taking second thought, invited the troublesome economist to dine with him. Hume put his legs under the ambassador's mahogany in the expectation of tasting the choicest viands and the most exquisite wines, but had to content himself with poor soup and poorer sherry, roast mutton and light Bordeaux, a chicken and a salad; supplemented with Adair's apologetical observation when the banquet was over: 'You see, sir, what these confounded Radicals have brought us to with their reductions. By-and-by, I daresay we shall come to prison diet, with pudding perhaps on Sundays.'

Scribe the dramatist met his match in a nobleman ambitious of gaining a literary reputation by proxy; from whom he received the following curious epistle: 'SIR—I have the honour to propose to you to associate yourself with me in the composition of a drama. Your name will figure by the side of mine; you alone composing the play, and I alone defraying all the expenses of the first representation. You shall have all the profits, for I work only for glory.'

Scribe replied: 'SIR—I have never been accustomed to harness together in my carriage a horse and an ass; I am therefore unable to accept your very kind offer.'

The nobleman closed the correspondence with: 'MONSIEUR SCRIBE—I received your note of refusal to unite our literary labours. You are at liberty not to understand your own interest, but not to allow yourself to call me a horse.'

Would-be wits are apt to have the tables turned upon them. At a dinner in honour of Nick Denton, one of the staff of the Illinois Central Railway, his friend Jack Wallace, intrusted with the toast of the evening, proposed it in this wise: 'The two Nicks—Old Nick and Nick Denton!' Denton rose to respond, saying he appreciated the honour conferred upon him by connecting him with Mr Wallace's most intimate friend, and scarcely knew how to requite the compliment; but as one good turn deserves another, he would give 'The two Jacks—Jack Wallace and Jackass!'

Cham the caricaturist turning into a restaurant, chanced to take possession of the favourite seat of a stock-broker. Upon coming in and seeing how things were, the latter called the proprietor aside and inquired if he were aware that the tall thin stranger occupying his usual place was the executioner. The horrified man hurried to Cham and entreated him to go away, saying M. Heldenrich need not pay for what he had eaten if he would only leave at once. 'Who told you I was the headsman?' asked Cham, without displaying any surprise at what he had heard. The landlord pointed out his informant. 'Ah,' said Cham, as he rose to depart, 'he ought to know me; I flogged and branded him at Toulon not two years ago.'

Hood once took a proper revenge upon some practical jokers who upset a boat before he could get out of it, giving him a thorough ducking. Directly he was safe on land he began to complain of cramps and stitches, and at last went indoors. His friends, rather ashamed of their rough fun, persuaded him to go to bed, which he immediately did. His groans and complaints increased so alarmingly that they were at their wits' end what

to do. Mrs Hood had received a quiet hint from the sufferer, and was therefore only amused at the terrified efforts and prescriptions of the repentant jokers. There was no doctor come-at-able; and all sorts of queer remedies were suggested and tried; the poet shaking with laughter, while they thought he was shaking with ague or fever. One rushed up-stairs with a kettle of boiling water, another tottered in under a tin bath, and a third brought a quantity of mustard. Hood then gave out in a sepulchral voice his belief that he was dying; and proceeded to give the most absurd instructions for his will, which his hearers could not see the fun of, for their fright. They begged him to forgive them for their unfortunate joke, and beseeched him to believe in their remorse; till unable to keep up the farce any longer, Hood burst into a perfect shout of laughter, which they thought at first was delirious frenzy, but which ultimately betrayed that the biters were bit.

General Charretie, known some thirty years ago as a capital talker, clever versifier, skilful musician, bold better, daring horseman, and dead-shot, was as cool as the proverbial cucumber. He once hired a Hertfordshire manor for the shooting-season, and in following his game was not particular about trespassing on the adjoining estate, belonging to a lord of high degree. The latter's keeper out with his master one morning, heard the General blazing away in an adjoining cover, and calling attention to the intruder's proceedings, was instructed to go and shoot one of the General's dogs and turn him off the ground. 'You had better take my pony; you will get back quicker,' said his lordship; and the keeper cantered away on a perfect treasure of a pony, that its owner would not have parted with for any amount. Upon reaching the spot where Charretie was blazing away at the pheasants, the keeper told him to get off the ground or, by his master's orders, he should shoot one of his dogs.

'Very well,' said the General; 'shoot the old one; but if you do, I shoot your pony; and as I am not sure where my manor ends, I shan't stir.'

The old dog dropped at a shot from the keeper; and before the man could turn round, the pony he bestrode was as dead as the dog.

'Now, my man,' said Charretie in the mildest of tones, 'if you shoot again, the next barrel is for yourself!'

The keeper took to his heels, told the doleful story to his master, who had not made up his mind how to act ere he received a challenge from the General for insulting him by ordering his servant to shoot his setter. Seeing the sort of customer he had to deal with, the nobleman thought it best to come to an amicable arrangement and accept the defeat.

The editor of the *Terre Haute Journal* had the impudence to write: 'The reason why Lafayette doesn't build a rink is this. The ladies of that city have such big feet that no more than four or five could skate in a rink at one time; therefore the concern wouldn't pay.' Whereupon the *Lafayette Journal* retorted: 'It is a number eleven lie. The Lafayette ladies are celebrated for their pretty feet. All's well, you know, that ends well, and the *Terre Haute* editor, afflicted with the daily exhibition of agricultural hoofs, is dying of envy. Goodwin of our city once made a pair of twenty-eights for a *Terre Haute* belle. He built

them in the back-yard on a sort of marine railway, and launched them. If ever an old woman lived in a shoe, it was down at Terre Haute.'

Ladies know how to give tit for tat, as a politician learned when, piqued by a fair listener noticing a pet dog while he was holding forth to her on the Eastern Question, he asked how a woman of her intelligence could be so fond of a dog. 'Because he never talks politics,' was the significant reply.

An Englishman attached to the Washington Commission incautiously remarked to his pretty American partner at a ball, that although he had seen many beautiful women, he had not come across a handsome man in the States. 'I suppose there are plenty of handsome men in England?' she observed. 'O yes, lots,' said he; provoking the poser: 'Then why didn't Queen Victoria send some over here?'

STORY OF A PARTRIDGE AND HER CHICKS.

ONE morning in the beginning of July an agricultural labourer, in the employment of an East Lothian farmer, was driving a reaping-machine in a field of long grass preparatory to haymaking. In a part of the field that the machine had not yet shorn, a hen partridge was sitting on a number of eggs which were within a few short hours of being hatched. It may naturally be conceived that the bird would hear with no little concern the sharp clipping noise made by the machine as, in its progress up and down the ridges, it approached nearer and nearer to the nest; but like a true mother, she would rather die than leave her nearly hatched young. As the knife of the machine, in quick shuttle-like motion, laid swath after swath of goodly rye-grass level with the ground, the iron fingers of the cutter struck the bird, killed her, and drove her some distance from the nest. To the moment of her death she kept the eggs warm; and the young life within them that she had cherished soon afterwards found protection.

The driver of the machine, who was a kind-hearted man, stopped his horses and gazed compassionately on the poor bird. Soon, however, his attention was withdrawn from the dead bird by hearing numerous minute, plaintive, peeping sounds—as if made by very tiny, fine-throated, tender chicks. Hastily concluding that a brood of young partridges lay buried and struggling for life in the nearest swath of grass, he turned it carefully over and over, in expectation of seeing a number of chicks; but after a diligent search, he could not discover any birds whatever. Still the peeping noises continued. The workman stood silent and listened attentively, in order that his ear might catch the true direction of the sounds. By the unceasing 'Peep, peep, peep,' he was attracted to a little hollow in the ground. There, almost hid from observation, lay sixteen sounding eggs, for it was from the eggs that the peeping chorus proceeded! The farmer, who was in the field, came to the spot where the driver was standing; and he being also of a humane disposition, placed the eggs carefully in his handkerchief, and carried them home to the farmstead, where they were soon placed under a common sitting hen. In a few hours afterwards the partridge chicks had broken

open their shells, and were running about their foster-mother crying 'Peep, peep, peep.'

The writer may be permitted to add, that when partridge chicks are hatched by a common hen, they should be intrusted to a gamekeeper or other person who understands the kind of food the birds need, otherwise it will be almost impossible to rear them.

THE FALL OF THE YEAR.

COLDLY and bright draws in the day;
Gloomy and drear it steals away;
For slowly now comes up the sun,
His Summer's ardent labours done;
And low his golden wheel declines
Where Winter shews his starry signs.

No more to earth the fervid beams
Give beauty such as poet dreams;
No more descends the glorious ray,
The rapture of the summer day.
The sky's deep blue is waxing pale,
The sun's inspiring fervours fail;
The slanting beam he gives is chill
Within the vale and on the hill;
And now, with many a jealous fold,
The clouds would all his cheer withhold,
Nor would on plain or height bestow
The soothing of his waning glow.

The flowers are gone, save those that still,
Like friends who cleave to us through ill,
Outbrave the bitter wind that blows,
And deck their season to its close.
The leaves that late were only stirred
By gentlest breath, that only heard
The song-bird's note, round these the blast
Blows keen and fierce, and rude and fast
The rising gale flings far and wide
Their withered bloom and idle pride.
The birds have fled; the wind alone
Makes song in many a sullen tone.

But sudden through the bursting sky
The sun again comes out on high;
The clouds fall back to yield him way,
And fly before his eager ray;
And gladness fills the breast again—
The glimpse of Summer come again!
Ah! sweet the beam, but like the smile
With which the dying would beguile
The mourning heart—the last sad ray
Love gives to cheer our tears away.
The light is gone, the moment's bloom
Is sunk again in cold and gloom.
So pass away all things of earth,
Whate'er we prize of love and worth—
The form once dear; the voice that cheered;
The friends by many a tie endeared;
The dreams the aching heart forgets;
The hopes that fade to cold regrets.

Sweet scenes, dear haunts, that once I knew,
My heart yet fondly turns to you.
Let seasons change, and be ye bright
With all the Summer-tide's delight,
Or let the Winter's gloom be yours,
Your beauty still for me endures;
For Memory keeps unfaded yet
What Love would have me not forget.

THRIFT AND UNTHRIFT.

WE lately said a word on Rich Folks, hinting that so far from being the monsters of iniquity which moralists and preachers have for ages denounced them, they are, taken all in all, public benefactors; for without the accumulation of wealth, by means of thrift and honest enterprise, the world would still have been in a deplorably backward condition. Riches are of course comparative. An artisan who by savings and diligence in his calling has insured for himself a competence for old age, is doubtless rich and respectable. Doing his best, and with something to the good, he is worthy of our esteem. What he has laid aside in a spirit of economy goes to an augmentation of the national wealth. In a small way he is a capitalist—his modicum of surplus earnings helping to promote important schemes of public interest.

Great Britain, with its immense field for successful industry and enterprise, excels any country in the capacity for saving. In almost every branch of art there is a scope for thrift beyond what is obtainable elsewhere. Thriftiness, however, among the manual labouring classes was scarcely thought of in times within living remembrance. Savings-banks to receive spare earnings came into existence only in the early years of the present century. Now, spread in all directions, and established in the army and navy, they possess deposits amounting to nearly thirty millions sterling. Besides these accumulations, much is consigned to Friendly Societies; and it is pleasing to observe that within the last twenty years, the artisan classes have expended large sums in the purchase of dwellings purposely erected for their accommodation. All this looks like an advance in thrifty habits—a stride in civilisation.

But after every admission of this kind has been made, it is too certain that vast numbers live from hand to mouth, save nothing whatever from earnings however large, and are ever on the brink of starvation. In this respect, the working classes, as they are usually styled, fall considerably below the peasantry

of France, who, though noted for their ignorance, and for the most part unable to read, have an extraordinary aptitude for saving; of which there is no more significant proof than their heavy loans to government when pressed to pay an enormous war indemnity to Germany. As the thrift of the French agriculturists sinks to the character of a sordid parsimony, which is adverse to social improvement, no political economist can speak of it with unqualified admiration. It only shews what can be done by two or three things—the economical use of earnings, the economical use of time, and the strict cultivation of temperate habits. From each of these predominating qualities a lesson might be judiciously taken. Though a lively race, fond of amusement, the French peasantry, and we may add, the peasantry of Switzerland, know the value of time. In them the 'gospel of idleness,' so pertinaciously preached up by indiscreet enthusiasts, has no adherents. In all our experience we have never seen such assiduity in daily labour from early morn till eve, as among the French and Swiss rural population. They would repudiate any dictation of a hard and fast line as to hours. Time is their beneficent inheritance, to make the most of for themselves and families.

Pity it is that in our own country time is so unthrifflily squandered. Obviously there is a growing disposition among the operative classes to diminish the daily hours of labour, to the detriment of individual and general prosperity. When we began life, ten hours a day, or sixty in the week, were considered a fair thing. Then came a diminution to nine, to eight hours, along with whole and half-holidays, but no lowering of wages. How this is to go on, we are unable to explain. We fear that unless something like common-sense intervene, a degree of individual and national disaster will ensue scarcely contemplated by the votaries of 'St Lubbock.' In his late speech at the opening of the Manchester Town-hall, Mr Bright adverted to the awkward consequences of indefinitely shortening the hours of labour. He is reported to

have said: 'We have for many years past been gradually diminishing the period of time during which our machinery can work. We are surrounded by a combination whose object is not only to diminish the time of labour and the products of labour, but to increase the remuneration of labour. Every half an hour you diminish the time of labour, and every farthing you raise the payment of labour which is not raised by the ordinary economic and proper causes, has exactly the same effect upon us as the increase of the tariffs of foreign countries. Thus we often find, with all our philanthropy in wishing the people to have more recreation, and with our anxiety that the workman should better his condition through his combination, that we are ourselves aiding—it may be inevitably and necessarily—but it is a fact that we are aiding to increase the difficulties under which we labour in sending foreign countries the products of the industry of these districts; and we must bear in mind that great cities have fallen before Manchester and Liverpool were known; and that there have been great cities, great mercantile cities on the shores of the Mediterranean, the cities of Phœnicia, the cities of Carthage, Genoa, and Venice.' Such sentiments are worth taking to heart. The preaching up of recreation, otherwise idleness, has gone rather too far. We begin to perceive that wages can be paid only in proportion to work done, and that if people choose to amuse themselves, there must correspondingly be a new adjustment of payments.

At the late meeting of the British Association, there was some profitable discussion on work, wages, and thrift. One speaker emphatically pointed out that unthrift was more concerned in producing poverty in families than a deficiency in wages. He said, that where there was a deficiency of food 'it would mostly be found that what was wanted had been consumed in drink.' Adding, 'As a matter of fact, the large families did the best, and the greatest men in science and as statesmen were mostly members of large families and younger sons upon whom early struggles for mental growth had produced brilliant results.' This corresponds with ordinary experience. Within our own knowledge, the greater number of persons distinguished in literature, the arts, and in commerce have been the sons of parents whose means of bringing up their families did not exceed a hundred, in some instances not eighty, pounds a year. Yet upon these slender resources, through the effects of thrift—as, for example, the case given by the late Sir William Fairbairn—families of six or seven children were respectably reared, and attained prominent places in society.

In almost every large town is observed a painful but curious contrast in the administration of earnings. On one side are seen the families of small tradesmen making a manful struggle to keep up respectable appearances at a free revenue of not more than a hundred a year; while alongside of them are families earning two pounds a week and upwards, who make no effort at respectability, and are constantly in difficulties. The explanation simply lies in thrift and unthrift. In one case there are aspirations and enlightened foresight; in the other there is a total indifference to consequences. A few weeks ago, the Rev. F. O. Morris, of Nunburnholme Rectory, Hayton, York, communicated to the *Times* some remarkable revela-

tions concerning unthrift. 'A gentleman of my acquaintance,' he says, 'living in a midland manufacturing town, gave me, two or three years ago, the following instances of the unthriftiness, or rather the outrageous extravagance, of the artisans there; such cases being quite common, the exceptions only the other way. I must premise that many of them with families were at that time earning from eight to twelve pounds a week; a single man as much as five pounds a week, and yet, though paid on Saturday evenings, they would come on the following Monday night to ask the manager for an advance of the next week's wages. And this not for any legitimate expenditure, for even those who had families lived generally in one room, kept no servant, and only employed charwomen. Nevertheless, well they might be in want of ready-money, for often you would see a party setting out on a Sunday for an excursion to some place or other in a carriage with four horses, and dressed in the most extravagant manner, but at the same time with much taste, owing no doubt to their employment being in the lace-trade.

'A charwoman told the wife of my informant that she knew one married couple who can earn seven pounds a week who often came to her on a Thursday to borrow a shilling, their money being all gone. They lived in two rooms, very badly furnished. A needle-woman also told the lady that she knew a couple who earned eight pounds a week, or even more, between them, who lived in two rooms wretchedly furnished, without even a cup or saucer, besides the two they used, to give a friend a cup of tea; that the woman would give four or five guineas for a dress, and had given as much as six guineas, which she would wear all day, from the first thing in the morning till it was shabby, when she would buy another as expensive, or even more so, according to the fashion. She never cooked their own dinner, but bought the most expensive things, took them to a public-house to be cooked, and dined there, eating and drinking afterwards. The "hands" in the trade of the place would often order, for one week, black tea at 4s. a pound, and green at 6s. They would also buy cucumbers at 1s. and 1s. 6d. apiece, beefsteaks for breakfast at 1s. 3d. a pound, and would only eat them fried in butter; salmon in like manner when it first came in at 3s. or 4s. a pound, and lamb at a guinea a quarter. For more light fare they would buy oysters at 2s. or 2s. 6d. a dozen, put down gold on the counter, and eat them as fast as a man could open them for them. My friend saw two men thus eat 10s. worth standing at a stall in the market-place. A man earning £3 a week, paid on the Saturday evening, got into a row with the police on the Sunday, was fined 25s. on the Monday, and not one out of a hundred or more of his fellow-workmen could advance him the money to pay the fine with, and he had to borrow it of the foreman. Another was earning £4 a week. His master told him he ought to lay by. "Oh," said he, "I can spend all I make." "But," said the master, "what shall you do, if the times are bad, with your wife and children?" "Let 'em go to the Union," said he. The master himself told my friend this. Mr Baker, the Inspector of Factories, in one of his Reports, stated that a moulder, his wife, and boy on an average earn

L.5, 10s. 6d. a week. He mentions a case of a moulder, his wife, and three children earning L.8, 7s. 2½d.

'How can we wonder, with such facts as these before us, that Mr Sandford, Her Majesty's Inspector, stated in one of his Reports: "Out of 50 (lads) examined in nine different night schools, 29, or 58 per cent, could not read. These night scholars are certainly not the most untaught of the collier lads. 'There's none of them as can read in our pit,' I heard two young colliers say; 'no, nor the master neither.' And yet we wonder that our colliers do not invest their earnings wisely."'
